**085832 TOPOLOGICAL DESIGN OF DISTRIBUTED CONTROL SYSTEMS USING THE PROLOG PROGRAMMING LANGUAGE.** The features of the logical programming language PROLOG are discussed with special reference to the topological design of distributed control systems. Applications are illustrated by a distributed system for control of an industrial process with a hierarchical structure. Topological problems are solved to determine the locations of computer units, the types of computer equipment installed at them, and the structure of the data transmission network. Since, in distributed control systems, computer facilities are located within a short range from one another, such systems can be interpreted as local area computer networks. (Edited author abstract) 5 refs.

Kozhevnikov, G.K. *Autom Control Comput Sci* v 21 n 3 1987 p 1-3.

**085833 ON THE LEADING EDGE OF PROCESS I & C.** Reducing operating costs and improving product quality were once the sole reasons for acquiring process technology. Advances in microelectronics, computer technology and mathematical models, however, have expanded the applications potential of process I & C systems dramatically. These and other new technologies, now allow automation specialists to plan plant safety and environmental protection into the process optimization strategy. (Edited author abstract)

Schneider, Ernst (Siemens AG, Karlsruhe, West Ger); Urbach, Walter. *Siemens Rev* v 55 n 1 Jan-Feb 1988 p 25-30.

**085834 BATCH CONTROL: A COST-EFFECTIVE FAULT TOLERANT SOLUTION.** State of the art fault tolerant control systems employing triple modular redundant (TMR) architecture are now available for use in the process industry. They are proven; the question is, are they cost-effective? In order to demonstrate that TMR systems are less expensive compared to conventional main/hot-standby systems - and under certain circumstances can be compared favorably in terms of cost with a simplex solution - both project and operational costs must be considered. The cost benefits of using a TMR system can be particularly demonstrative in the control of a batch plant.

Mulligan, Tony. *Process Eng (London)* v 68 n 9 Sep 1987 p 39, 41, 43.

**085835 FIELD BUS COMMUNICATION STANDARD - A WINDOW OF OPPORTUNITY.** The quest for plant-wide communication standards to interconnect automation systems has tended to focus on the requirements of the higher level computing devices. The use of standard communication protocols at the lowest automation level of field mounted devices has been the missing piece in the hierarchy. But this situation is rapidly changing. Since international field bus standards work started in 1985, the number of commercially available intelligent field instruments has increased and four bus contenders have become prominent. The author reviews the world-wide engineering design activities aimed at development of a common protocol for linking low-level industrial control elements.

**085840 CHOOSING DISTRIBUTED CONTROL SYSTEMS.** The problem of selecting a right control equipment for distributed control purposes is addressed. The authors assert that the best systems for plant control can be selected using a benchmarking approach. Guidelines on the selection are given.

Alcock, Phil (KBC Process Automation); Ogden-Swift, Andrew. *Control Instrum* v 20 n 5 May 1988 p 79-81.

**085841 LOW COST MICROS AID DISTRIBUTION.** Traditional process control and industrial automation architectures based on a centralized computer system are steadily being replaced by the distributed system concept. The major stimulus for this change is the availability of inexpensive, but capable single loop controllers, programmable controllers and intelligent measurement/control interface stations, the majority of which are designed around the ubiquitous microprocessor. The author compares trade-offs between centralized and distributed control and reviews some distributed control equipment and communication interfaces available.

Readman, Geoff (DI-AN Micro Systems). *Control Instrum* v 20 n 5 May 1988 p 83-85.

**085842 SIMPLIFIED TESTING OF NETWORK CONTROL SYSTEMS.** Components of network control systems, particularly of the process computer system, must be tested before delivery and commissioning. Such systems are complex, and the test equipment and methods must be equally sophisticated. The PROSIM process simulator provides the data necessary for testing - in the form of messages having the same structural and dynamic response as in the actual system. (Edited author abstract) 2 refs.

**085843 CONTROL SYSTEMS FOR PROCESS INDUSTRIES.** Process industries are going through a stage that their counterparts, the discrete metal-bending and assembly manufacturers, went through 15 years ago. They are realizing they can rely on commercially packaged software to manage their businesses and no longer can hide behind the excuse that their businesses are 'unique'. It is reported that there are more than 200 MRP software vendors, and many manufacturers have outgrown their first systems and subsequently implemented newer replacement systems. Material requirements planning (MRP) software vendors, and many manufacturers have outgrown their first systems and subsequently implemented newer replacement systems. It is argued that because different rules govern the functions within process firms, the controlling software must fit the task and not be a variation of MRP for discrete manufacturers.

**085845 PCS EXPAND ROLE IN PROCESS CONTROL.** The role of the personal computer has grown rapidly from a household amusement to a practical - and, in some cases nearly indispensable - industrial fixture. The personal computer (PC) can be found in engineering offices, on the plant floor, in control rooms, in executive suites, and in a variety of administrative, financial and supervisory areas. It is flexing its newly-found muscles in control applications that were not even dreamed of 10 short years ago. (Edited author abstract).

Waterbury, Robert C. (InTech, Research Triangle Park, NC, USA). *InTech* v 35 n 7 Jul 1988 p 27-31.

**085846 MODULAR PROCESS CONTROL SOFTWARE OF THE MULTI-LOOP DIGITAL CONTROLLER.** The modularization of process control software provides a method of software design. This method possesses some outstanding advantages: it is simple to design and convenient to extend to new functions. The software designed with this method is flexible in application and is easy to use in forming various control systems for users. This paper deals mainly with the fundamental principle and designing method of the modular software of a multi-loop controller, the construction of the module and its connecting program. Some examples are given to illustrate the feasibility of this method. (Author abstract). 2 Refs.

**085847 PROPAGATION OF FAULTS IN PROCESS PLANTS-5. FAULT TREE SYNTHESIS FOR A BUTANE VAPORISER SYSTEM.** An interactive, computer-based facility, FAULTFINDER, has been developed for fault tree synthesis. The modelling of fault propagation, fault tree synthesis, the interactive facility and its application to a pump changeover sequence have been described in four earlier papers. This paper describes the application of FAULTFINDER to the construction of a fault tree for a butane vaporising system. The results are compared with those achieved by the manual digraph method of fault tree construction. It is shown that FAULTFINDER is capable of generating logically consistent and structured trees for a process system comprising control and trip loops. (Author abstract). 7 Refs.

**085848 PROCESS-MONITORING RAISES PRODUCTION, IMPROVES QUALITY.** Automation at Georgetown Steel in the form of computerized process-monitoring has produced these benefits: a substantial reduction in time for vital verification of the content of molten steel; reduced downtime throughout the plant; improved quality of products and higher 'hit rates'; better information on true product costs, and improvements in yield. The installed system includes the Concept/32/27 with two megabytes of memory, two terminals in a lab; a terminal in the control room of each furnace, various tape and disk drives, communications including 3780 emulation and I/O hardware and the necessary languages, diagnostics and utilities. A superminicomputer is used in the metallurgy lab, heat sample readings are analyzed via computers and each furnace has a microcomputer installed in it.

**085851 PROCESS STYLE PACKAGES FOR DISCRETE EVENT MODELLING: DEMOS: A PROCESS BASED SIMULATION PACKAGE.** This is the fourth paper in a series dealing with discrete event simulation modeling. We illustrate modelling in Demos by emphasizing its process synchronisation mechanisms. These include resource allocation based on the mutual exclusion and the producer/consumer paradigms, inter-process cooperation via the master/slave synchronisation, waits until, and process cancellation and interruption. The simpler synchronisation method are illustrated by small examples. In the final portion of the paper, we illustrate program development in Demos with a fairly substantial model of steel mill operations. The model brings nearly all of the features of Demos into play. (Edited author abstract) 21 refs.

**Control Systems** See Also GLASS MANUFACTURE—Control Systems.

**085853 DESIGN OF A MONITORING SYSTEM FOR THE AUTOMATIC PROCESS CONTROL SYSTEM OF POWER MACHINE BUILDING PLANTS.** The software of automated systems is divided into applied software (ASW) and system software (SSW). Applied software represents the program implementation of traditional methods of design operation and procedures and is the designing component of any automatic process control system (APCS). A group of ASW components forms the subset of objectively oriented APCS subsystems. Recently the concept APCS software has been connected only with ASW, i.e., in essence groups of applied programs are treated as an APCS. A similar approach is now fairly widespread, especially for the APCS of construction objects. It is now clear that there is a need to isolate certain objectively independent (invariant) subsystems of APCS software which carry out specific system functions. The group of indicated invariant subsystems forms the APCS system software. 1 ref.

**085855 APPLICATION OF GENERALIZED PREDICTIVE CONTROL TO INDUSTRIAL PROCESSES.** A novel algorithm called generalized predictive control (GPC) is shown to be particularly effective for the self-tuning control of industrial processes. The method uses long-range predictive control ideas with a carefully chosen controlled autoregressive and integrated moving-average (CARMA) plant model and various horizons that allow for a rich variety of control objectives. The procedure can adapt to process dead time and model order, and a multivariable version gives tight control of complex plants without prior knowledge of the interactor matrix. Applications of GPC to a cement mill, a spray-drying tower, and a compliant robot arm give performance better than that of fully tuned proportional-integral-derivative regulators. 14 refs.

**Design** See Also CHEMICAL EQUIPMENT—Reactors; CHEMICAL PLANTS—Control Systems; CONTROL SYSTEMS, DIGITAL—Design; CONTROL SYSTEMS, MULTIVARIABLE—Computer Aided Design.

**085859 DESIGN OF SET POINT REGULATORS FOR PROCESSES INVOLVING TIME DELAY.** An efficient frequency domain methodology for the design of set point regulators for high-order process models involving relatively large pure time delay is presented. The unique advantage of the methodology is that it enables the designer to rapidly visualize the structure of the required controller as soon as the time and frequency domain specifications are stipulated for the closed-loop system. Optimizing the parameters of an appropriate structure improves the robustness of the controller. The method

does not require order reduction of the original model, and time delay is handled directly. Also, only output feedback is utilized. (Author abstract) 27 refs.

**085860 PROCESS CONTROL USING IR SENSORS AND SCANNERS.** Temperature and thermal behavior of materials and fabricated parts in process are the most critical factors in the manufacturing process. For this reason, temperature is by far the most measured quantity in industrial process monitoring and control. Conventional methods using thermometers and thermocouples are commonly used for the majority of applications. Noncontact temperature measurement using infrared sensors has become an increasingly desirable alternative to conventional methods as IR sensors have become less expensive, more reliable and electrically interchangeable with conventional thermistors and thermocouples. Now, with the introduction of innovative computer hardware and software, full-image thermal control of products and processes is being made possible.

Kaplan, Herbert. *Photonics Spectra* v 21 n 12 Dec 1987 p 92-95.

**085861 PREDICTIVE CONTROLLER DESIGN FOR SINGLE-INPUT/SINGLE-OUTPUT (SISO) SYSTEMS.** This paper presents a fundamental analysis of the stability of single-input/single-output (SISO) closed-loop systems with predictive controllers. The analysis can be used to calculate allowable modeling errors for a given system and controller. Design parameter selection guidelines for prediction controllers in SISO systems have been developed by considering performance, robustness, and ease of tuning. The performance and robustness of the resulting controllers are demonstrated in four numerical examples and compared to controllers designed using other parameter choices. (Author abstract) 14 refs.

## Economics

**085862 1988 CONTROL INDUSTRY OUTLOOK: BEGIN WITH THE BASICS.** Every new year promises new challenges to engineers in process control industries. Usually, the challenges are clear: improve quality, increase productivity, reduce scrap, improve the profit margin by 15%, cut the leadtime for new product introductions, or conserve energy. In 1988, all of the above, and more, still apply. Yet, the real challenges facing instrument/control engineers and managers are not so easily explained. Rather, they have become clouded because they are so intimately intertwined. An attempt is made to clarify the confusion and point out some pertinent guidelines.

**Identification** See Also CONTROL SYSTEMS, ADAPTIVE—Design.

**085867 ACTIVE IDENTIFICATION OF THE PARAMETERS OF A LINEAR STATIC PLANT (A GAME PROBLEM OF EXPERIMENTAL DESIGN).** The design is considered of algorithms of active multiple identification of the parameter vector of a linear static plant. It is assumed that this vector belongs to a preassigned convex polyhedron, and that the disturbances are bounded. Properties of optimal active identification are studied that make it possible to reduce the diameter of the a posteriori region of uncertainty of the parameter vector. A recursive suboptimal algorithm of active identification is proposed, its convergence is proved, and bounds are obtained for the convergence rate. The results of numerical simulation are also presented. (Edited author abstract) 8 refs.

**085871 INTRODUCING DIGITALLY INTEGRATED MEASUREMENT.** Plant managers, process engineers and plant operators for decades have decried the gap between control and measurement technology. More than one system designer or control engineer has lamented that many of his best ideas for more effective control required a level of measurement performance that he could not find on the market. Among the most frequently cited deficiencies are: insufficient accuracy, too much shift or drift, limited rangeability, uncertainty about the validity of transmitted data, and high support and maintenance costs. Ways to mitigate such deficiencies are considered. (Edited author abstract).

**085874 PROCESS CONTROL MANAGEMENT PAYS OFF FOR CORNING.** Process control management (PCM) is a technique which directs attention of quality control and engineering personnel only to machines and processes that present difficulties. With PCM, the burden of continuous checking is placed on the operator. As soon as the data are obtained from a specified number of operations, they are fed into the system and tabulated to produce a new picture of the area. The new picture is available to production, quality control, and engineering for analysis and reevaluation. PCM was implemented successfully in the late 1970s in four of six Corning Glass Works electronics plants - two in the U.S., one in France, and one in England. Annual savings of more than \$200,000 in direct labor and \$300,000 in selection (yield) improvement were realized. 2 refs.

**085875 DETERMINATION OF THE EXPECTED ECONOMIC EFFECT OF AUTOMATED PROCESS CONTROL SYSTEMS BY STRUCTURAL-STATISTICAL MODELING.** The authors have developed and tested a modeling procedure for a number of automated process control systems in ferrous metallurgical industry which links the target indicators characterizing the technological effectiveness of the control system with indicators representing the economic effectiveness of these systems. A specific feature of their methodology is the introduction of latent production indicators which characterize the major operating conditions of the automated process. The proposed approach makes it possible to determine the magnitude of the economic effect also in cases with complex dependence between the improved technological indicators and the resulting economic production indicators. 3 refs.

**085876 PRINCIPLES AND ENGINEERING OF PROCESS CONTROL WITH PETRI NETS.** Event-related control is considered in which process and related process control can be described by states and transitions that can be represented concisely by a Petri net (PN). Both process and related process control systems are event-related, causal, and concurrent and define a special type of PN using a few primitives that are assembled to form a net for which structural and dynamic invariants apply. The PNs can be used for a general approach to event-related process control in simulating, checking, debugging, and stating the quantitative deviations from the ideal solution for any given process control system. The technique can be applied to continuous or discrete processes, and provides formal checks at all development stages. It allows for components with nonideal behavior and yields numerical performance criteria. The invariants allow the PN to be structured in such a way

that even complex process control systems become manageable. Examples are presented for the control tasks in an electrical substation. 11 refs.

**085877 STATISTICAL CONTROL OF VLSI FABRICATION PROCESSES - I: A FRAMEWORK.** A general framework for statistical control of VLSI (very large-scale integration) fabrication processes is given along with the architectural description of a software system that can be used for monitoring, diagnosis, and quality/quantity control of computer-aided integrated circuit (IC) manufacture. The task of process control is formulated as one of profit maximization, and the associated objective function and the constraints are developed for a number of manufacturing scenarios. The IC fabrication process is modeled as a stochastic system and the necessary conditions for efficient statistical control of VLSI fabrication processes are described. 16 refs.

**Optimization** See Also ELECTRONICS PACKAGING—Quality Control.

**085879 PROCESS FLOWSHEET OPTIMIZATION STRATEGIES: RECENT RESULTS AND FUTURE DIRECTIONS.** Here we review earlier optimization strategies and emphasize more recent strategies based on successive quadratic programming (SQP). This report describes the process optimization problem with a simple flowsheeting model and briefly discusses the infeasible path approach, which permits simultaneous recycle convergence and optimization with SQP. Several improvements to the infeasible path algorithm are then outlined that include better gradient calculation and scaling strategies, a more efficient line search function and more reliable performance through intermediate recycle convergence. These concepts are applied to a large-scale process problem and resulting improvements are demonstrated. Finally, we present a brief discussion of open research questions and directions for future research. (Edited author abstract) 34 refs.

**085880 ECONOMIC DESIGN OF SAMPLING CONTROL STRATEGIES FOR A CLASS OF INDUSTRIAL PROCESS.** Many authors have proposed models for the optimal design of control charts for the control of the defect rate for industrial processes. If it were, the obvious optimal strategy would be to rebuild the process, possibly without samplings, after each batch or unit produced. This paper considers the determination of the optimal sample size and sample interval for the case where the process does not have to be rebuilt, but rather may be simply adjusted at a nominal cost after each sample. A model, which assumes a continuum of process fraction defectives, is developed and then used to explore the effect of fixed and variable sampling cost, specification limits and measurement errors on the optimal sampling policy and costs. (Edited author abstract) 23 refs.

**085881 CHARACTERIZING AND OPTIMIZING MULTI-RESPONSE PROCESSES BY THE TAGUCHI METHOD.** We demonstrate the ability of the Taguchi technique accurately to characterize and successfully to optimize complicated multi-response processes with the minimum of experiments, provided one uses simple statistical techniques which can ensure valid and definitive results. We point out the usefulness of suitable data-transformations, and we suggest a systematic procedure for establishing the optimal operating conditions and for carrying out confirmatory experiments. For the particular case detailed in this paper (which is typical of multi-response processes) the Taguchi technique achieved an improvement in uniformity of a factor of 2, together with optimized process control. (Edited author abstract) 14 refs.

**085882 INTEGRATED COST MODEL FOR THE JOINT OPTIMIZATION OF PROCESS CONTROL AND MAINTENANCE.** Statistical process control and preventive maintenance have been treated separately by past research. This study presents an economic model that incorporates both process control and maintenance procedures, and simultaneously optimizes their design parameters. It is shown how a pure process-control policy and a pure preventive-maintenance policy constitute special cases of the general model. Numerical examples illustrate the application of the method and suggest that, under the Markovian deterioration assumption, in many cases a pure policy is economically justifiable. (Author abstract) 7 refs.

**Performance** See Also CONTROL SYSTEMS—Performance.

**085883 PROCESS CONTROL STRATEGY WIDENS.** Statistical process control is implemented in many of today's distributed control systems, with this tighter control showing up as increased quality at the end of the day. Taylor MOD systems provide statistical calculations as standard within the system software. Statistical calculations are part of the standard library of configurable control functions, a menu-driven application software package for control and data acquisition. Some specific applications are reported. It is argued that statistical control techniques provide another means of tightening the process and improving final product quality.

## Quality Control

**085886 STATISTICAL PROCESS CONTROL - ITS IMPLICATIONS FOR THE METALS INDUSTRY.** Ford's operating philosophy of never ending improvement has resulted in a change of emphasis from defect detection to defect prevention through the application of Statistical Process Control (SPC), employee involvement and training. This approach will lead to improvements in both quality and productivity that will be of mutual benefit to suppliers and Ford. (Author abstract)

Cordwell, T.C. (Iveco Ford Truck Ltd.). *Int J Mater Prod Technol* v 2 n 2 1987 p 149-155.

**085887 GAUGE R&R - THE ORPHAN OF SPC.** For statistical process control (SPC), often little attention has been paid to the accuracy of numbers. This involves the gage producing the numbers, the person using the gage, the environment, the method, and anything else that could affect the repeatability and reproducibility of the measurements. All of this has been reduced to a new technique, and a new buzzword: Gage R&R, which stands for Gage Repeatability & Reproducibility. According to the General Motors General Quality Standard for Purchased Material, there are five elements involved in determining Gage R&R: accuracy, repeatability, reproducibility, stability, and linearity.

Crosby, David C. (Crosby Co.). *Rubber World* v 198 n 3 Jun 1988 p 12-13.

## Reliability

**085888 CUMULATIVE SUM CONTROL SCHEME FOR TRUNCATED EXPONENTIAL DISTRIBUTION WITH GROUPED OBSERVATIONS.** The Cumulative Sum (CUSUM) control scheme for testing the mean of a doubly truncated exponential distribution is constructed by considering group of observations at each state of inspection. Emphasis is given on the effect of group size and truncation intervals on the parameters of the V-mask of the CUSUM chart and the average run length. It is seen that the grouping procedure enables one to have an early detection of the shift in process mean. (Author abstract) 6 refs.

Kakoty, S.; Chakravorty, A.B. *QR J* v 14 n 2 May 1987 p 51-55.

## Research

**085889 CLOSED-LOOP TUNING OF PROCESS CONTROL SYSTEMS.** A technique for tuning PID controllers, involving a single dynamic test (such as a step or pulse change in set point) implemented during closed-loop operation, is proposed. The resulting transient data are used to predict the frequency response of the open-loop process which in turn is used to compute the optimum controller settings. Simulation results reveal that this technique provides reliable tuning constants even when such practical problems as process noise and unanticipated load upsets arise during implementation. A comparison with the recently proposed tuning alternative confirms that in general the suggested procedure, apart from being more flexible, yields also relatively better results. (Edited author abstract) 10 refs.

## Reviews

**085890 CONTROL OF PROCESSES WITH TIME DELAYS.** The need to control processes with time delays can be found in many aspects of the metals industry from refining to rolling mills. When the time delay becomes long compared with the system time constant, or when the time delay varies, then control of the process becomes difficult using classical control methods. Yet, with the increasing demand to have tighter control of the processes, methods must be developed to achieve high-quality control despite the time-delay problem. Three controllers are evaluated for their applicability to this problem: the classic proportional-integral (P-I), the Smith linear predictor, and the Clarke-Gawthrop self-tuning controller. Each of the controllers is implemented on an example process which is first-order with a long time delay. Implementation details, like selection of tuning parameters, are discussed. What type of performance can be expected from the classic P-I controller is quantified in terms of time delay and time constant. All three control strategies are evaluated for their response to step reference changes, step load disturbances, and variations in the process time delay. No one control strategy has the perfect solution, so the advantages and limitations of each strategy are presented and discussed. 7 refs.

## Robot Applications

**085891 PREP OF HIGH-DENSITY COMPONENTS.** A CAD data-driven SMD placement system is presented. The system accurately places a wide range of components including chip capacitors, electrolytic capacitors and large quad packs with 0.025-in. lead spacing. To control processes involved in lead forming, tinning, inspection and kitting these very expensive high-density quad packs, a robot is used. All tooling control, vision system application and data logging is performed by software running on the robot controller. Variables governing flux and solder processes are stored in decoupled databases that define component geometries and feeder inventories. Kits are built from the same CAD databases used by the placement workcell.

Stover, Jeff (Gelzer Systems Co, Westerville, OH, USA). *Circuits Manuf* v 28 n 2 Feb 1988 p 28, 30.

**085892 LAYOUT PLANNING AND SIMULATION FOR APPLICATION OF ROBOTS.** In the case where robots are introduced into a production line, if the operation scenario of the robots is known beforehand in the planning stage, it is possible to save time from robot introduction to production line start-up. This paper gives an outline of an actual engineering technique application with the aid of computer technology. For example, 'ROSET' is a CAD system for robots application engineering developed by KHI. This system is useful for the layout planning of robots, the precheck of the operation motion and the generation of the teaching data, when it is planned to introduce robots into a production line. This paper gives a concept concerning the planning and the simulation for application of the robots. (Edited author abstract).

## Robustness See COMPUTER SOFTWARE—Reliability.

## Stability See Also CONTROL SYSTEMS, NONLINEAR—Design.

**085893 PROCEDURE FOR COMPUTING OPTIMAL STABILITY PROPORTIONAL CONTROLS. PART I.** Among process control systems, astatic proportional-integral (PI) and proportional-integral-derivative (PID) controls hold an important place. This is because the controls manufactured in quantity by the instruments making industry produce just these controlling actions. The creation of effective and fairly simple procedures for

analyzing these systems is a factor in expanding the possibilities and improving the quality of PI and PID systems. Optimal stability solutions were found in a previous work for the problems in designing the linear control systems. However, the form in which these optimal solutions are given does not lend itself to analyzing optimal systems or to understanding their physical meaning. Results of a previous work are used for designing optimal PI and PID systems into a form more convenient to understanding and practical use. Special cases of computing PI control systems are examined. 2 refs.

Shubladze, A.M. *Autom Remote Control* v 48 n 4 pt 1 Apr 1987 p 435-442.

## Structure

**085894 CONCEPT OF 'EIGENSTRUCTURE' IN PROCESS CONTROL.** Much of the work in multivariable process control has been directed at finding control structures that minimize interaction among loops and decouple the system. This paper claims that this approach is flawed. What is really important in the vast majority of chemical and petroleum processes is a structure that does the best job in rejecting load disturbances. This inherent or intrinsic 'eigenstructure' (choice of controlled and manipulated variables and their pairing) is that configuration which yields a system that is naturally self-regulating for load disturbances and self-optimizing. Eigenstructure is a unifying concept that links several previously published approaches to the process control problem. (Author abstract) 8 refs.

## Technology Transfer

**085895 TRANSFERRING TECHNOLOGY TO DEVELOPING NATIONS.** This paper reviews the principles of technology transfer and four examples that illustrate pitfalls in undertaking technology transfer programs without a thorough understanding of the process. The nature of the commitment required is emphasized and then it is noted that frequently long-term commitment cannot be maintained. The concept of mini-technology transfer as a solution to continuing efforts in periods of depressed economic activity is presented. Mini-technology transfer involves the use of mentors, tutors and tapes. Mentors help with the decision process and teamwork. Tutors and tapes help to upgrade technology applications. ## Temperature Control See Also STEEL HEAT TREATMENT—Temperature Control.

**085897 CONTROLLER TUNING FOR A SLOW NONLINEAR PROCESS.** Determining the tuning constants of a classical PID (proportional-integral-derivative) controller for a slow nonlinear process, such as the temperature loops on a heat-treat or annealing furnace, can be a laborious task. Several tuning methods were considered to identify a method that could be applied easily in the field with limited resources. The Zie-

gler-Nichols method proved to be easy and effective. Results obtained by using the Ziegler-Nichols open-loop method to determine the tuning constants for a classical PID temperature controller for a heat-treat furnace are described. The process being controlled is described, and open-loop test data are presented. 6 refs.

**085898 HEURISTIC APPROACH TO PRODUCT DESIGN.** A dynamic-programming heuristic is described to find approximate solutions to the problem of identifying a new, multi-attribute product profile associated with the highest share-of-choices in a competitive market. The input data consist of idiosyncratic multi-attribute preference functions estimated using conjoint or hybrid-conjoint analysis. An individual is assumed to choose a new product profile if he/she associates a higher utility with it than with a status-quo alternative. Importance weights are assigned to individuals to account for differences in their purchase and/or usage rates and the performance of a new product profile is evaluated after taking into account its cannibalization of a seller's existing brands. (Edited author abstract) 17 refs.

**085899 IMPROVING PRODUCT DEVELOPMENT USING ORGANIZATIONAL ANALYSIS.** This article proposes an organizational analysis matrix to help companies establish an R&D program that provides better new products faster and less expensively. The author discusses staff management and marketing; R&D department planning, structure and controls; R&D department innovation and creativity; and manufacturing, quality and finance operations. (Author abstract)

Gerace, Michael J. (ASTER Inc, Yellow Springs, OH, USA). *Adhes Age* v 31 n 1 Jan 1988 p 28-30.

**085900 NEW APPROACH TO PRODUCT DEVELOPMENT.** In contrast to the traditional serial approach to product development which does not maximize quality or minimize time to market, the parallel approach combines a wider range of talent and disciplines and results in innovative ideas enabling a company to become or remain competitive. Having the whole development group - from marketing to manufacturing - work on the project together as well as make several passes through the development cycle, allows mistakes to be made early and enables the group to consider a wide range of possible designs before choosing the best.

Kelley, D. *Eng Dig (Toronto)* v 33 n 3 Mar 1987 p 15-16.

**085901 ROLE OF EXPERIMENTAL VIBRATION ANALYSIS IN PRODUCT DEVELOPMENT AND MACHINE DIAGNOSTICS.** Since the advent of the mini-computer in the mid-sixties experimental vibration analysis has had a tremendous increase in scope and application. This paper discusses the role of experimental prototype of the techniques involved and contains case studies concerning the development of prototypes of an

agricultural aircraft, a washing machine and a commercial vehicle suspension, as well as a diagnostic case study of ship vibrations. (Author abstract) 7 refs.

de Cock, Simon G.J. (DSIR, Auckland, NZ). *Trans Inst Prof Eng NZ Electr Mech Chem Eng Sect* v 14 n 3 Nov 1987 p 152-162.

**085902 MAKING IT SIMPLE: DESIGN FOR ASSEMBLY.** Design-for-assembly procedures are now followed widely throughout industry and are providing benefits beyond reductions in assembly costs. In fact, simplified designs resulting from the use of DFA techniques often lead to reductions in the cost of parts significantly greater than reductions in the cost of assembly. Other benefits, more difficult to quantify, include reductions in inventory and record keeping and improvements in material and production flow. Design for assembly involves reducing the number of separate parts to a minimum and making the remaining parts as easy as possible to assemble. The paper evaluates by means of examples various alternative designs and compares the end product costs by changing the design.

Boothroyd, Geoffrey (Univ of Rhode Island, Kingston, RI, USA). *Mech Eng* v 110 n 2 Feb 1988 p 28-31.

**085903 EXPERT APPROACH TO DESIGN.** The importance of good design to business success is recognized by a growing number of UK companies. This article discusses three successful products in which help from an independent design consultant was provided. A reduction in manufacturing costs, leading to an increase in sales volumes of a Heparin injector, was the challenge put to Cambridge Consultants (CCL) by Princess Risborough-based manufacturer Edwin Burgess. Cost reduction was the major factor when Havant-based manufacturer of louvered ventilators, Colt International, invited PE Consulting Group to carry out a feasibility study. When Permutit decided that its water deionisers needed redesigning, the Design Council put the company in touch with Moggridge Associates, a London-based design consultancy.

Anon. *Engineering (London)* v 228 n 2 Feb 1988 p 84-85.

**085904 DESIGN ISSUES IN MECHANICAL TOLERANCE ANALYSIS.** Tolerance analysis is a valuable tool for reducing manufacturing costs by improving producibility. Several useful methods of selecting design tolerances are presented with examples. The common and more advanced tolerance analysis methods are also reviewed and evaluated. A simple new tolerance analysis model suitable for designers is described as an alternative to the advanced methods. It is much more flexible than the common engineering methods. For example, it can mix statistical and worst-case components in the same assembly. Also, it includes a critical manufacturing variable that is often overlooked: 'nominal shifts' or biased distributions. (Author abstract) 11 refs.

Chase, K.W. (Brigham Young Univ, Provo, UT, USA); Greenwood, W.H. *Manuf Rev* v 1 n 1 Mar 1988 p 50-59.

**085905 USE OF  $2^k-P$  DESIGNS IN PARAMETER DESIGN.** The article shows that a single  $2^k-P$  fractional factorial design matrix and the traditional data analysis techniques associated with this design can be used effectively to achieve the goal of parameter design while reducing the total number of experiments required. A real example is used to compare Taguchi's two-part design and S/N analysis to a  $2^k-P$  design and its associated analysis. Also, a flow diagram is presented to guide a practitioner through the parameter design process using a  $2^k-P$  design. This flow diagram provides an annotated guide to the literature on  $2^k-P$  decision and shows the design processes leading to proper choice of design and appropriate data analysis techniques. (Author abstract) 12 refs.

Song, Jae; Lawson, John. *Qual Reliab Eng Int* v 4 n 2 Apr-Jun 1988 p 151-158.

**085906 DESIGNING FOR MANUFACTURABILITY.** Manufacturability is the measure of a design's ability to consistently satisfy product goals while being profit-

able. Product goals can be broken down into several categories: technical performance, quality, reliability, availability, and cost. Traditionally, design engineers have focused on the technical performance of products and not on other manufacturability considerations. The use of design guidelines for manufacturability can change this focus and permit significant product improvements. This article discusses how the best manufacturers address potential problems before they occur. Subjects covered include defect levels and quality, reliability, availability and cost.

Heidenreich, Paul (Manufacturing Technique). *Qual Prog* v 21 n 5 May 1988 p 41-44.

**085907 RATIONALISATION RESULTS IN ASSEMBLY-ORIENTATED DESIGN.** Assembly-orientated product design means that the products should be designed in such a way that expenditure on assembly and production costs are reduced to a minimum. The design process is divided into four stages: planning; rough design; drafting; and detailed design, and the needs for assembly-orientated product design will vary with different design activities. The assembly-orientated design process shows that among the large number of applicable aids the most important are the systematically applied design rules and the evaluation of the suitability for assembly. Design rules represent a set of known and well-tried solutions for certain design tasks and can be conveniently summarised in catalogues. 7 refs.

## Accident Prevention

**085908 VIEWING SAFETY FROM A POSITIVE PERSPECTIVE.** Recent, highly publicized failures of engineered systems and facilities make it important to put the issue of safety in engineering into perspective. Given a burgeoning population and a vast increase in the quantity, scope, and complexity of engineering work worldwide, the level of safety we have achieved is incredibly high. The failures that have occurred - tragic though they are - involve only a tiny fraction of total engineering activity. It would seem that the public and the press do not always take this fact into account.

Allen, William F. (Stone & Webster Inc, New York, NY, USA). *Mech Eng* v 110 n 7 Jul 1988 p 78-81.

## Assembly

**085909 DESIGN FOR ASSEMBLY.** DFA procedures have traditionally relied on the use of a few general guidelines to aid the designer in the product assembly construction and component feeding and orientating. While Design for Assembly (DFA) is a relatively new field, the increasing realization that it is the crucial factor in automating assembly and handling processes has meant that there is strong reader-interest in this topic. (Edited author abstract).

1986 p 90-96.

**Computer Aided Design** See Also BEARINGS—Marketing; BICYCLES—Design; COMPUTER AIDED DESIGN—Economics.

**085911 RATIONALISED APPROACH TO THE APPLICATION OF CAD WITHIN MECHANICAL PRODUCT DESIGN.** This paper reviews the nature of the product design process by focusing on the types of design that arise throughout the life cycle of an engineering product. It is proposed that considerations of 'design by evolution' and 'design by innovation' should be carefully assessed as fundamental criteria when formulating decisions on the adoption and implementation of CAD within mechanical product design. It is further suggested that, within the conceptual boundaries of product design, the application of CAD techniques may accelerate a product's progression from the state of innovative design towards the evolutionary design condition. (Author abstract) 9 refs.

Black, I. (Heriot-Watt Univ); Linton, H.C. *Comput Aided Eng J* v 4 n 5 Oct 1987 p 213-216.

**085912 PART-FEATURE RECOGNITION SYSTEM FOR ROTATIONAL PARTS.** A part-feature recognition system for the conversion of a CAD language to a CAM language is developed. The parts of interest are rotational without deviation. The recognized part information is posted into a part-definition data structure, which many manufacturing functions such as computer-aided process planning, group technology coding, NC program generation, and inspection can access to. A part-feature recognition algorithm, the 'intelligence' of the system, is discussed in great detail. Finally, an example is evaluated to demonstrate the success of the system. (Edited author abstract). 13 Refs.

Rong-Kwei, Li (Nat'l Chiao Tung Univ, Taiwan). *Int J Prod Res* v 26 n 9 Sep 1988 p 1451-1475.

## Computer Applications

**085913 PRODUCT DESIGN AND INTRODUCTION SUPPORT SYSTEMS.** Design decisions made early in the product realization cycle can have a dramatic effect on the manufacturability, quality, and ultimate marketplace success of a product. The features of CAE/CAD systems must ensure that, as designs progress, they adhere to design rules that codify manufacturability and quality. But that is only the start. For successful introduction of a product into the factory, computer-aided systems must be integrated with the design aids to augment the design information with all the factory-specific information needed to reach the state where the product is ready to manufacture. All this information must be put under change, version, and configuration control so that the factory is assured of accurate and consistent information. Finally, the data must be made available to the ordering systems to ensure that the product is manufactured to specification. This article describes the AT&T computer aids that satisfy these needs. (Author abstract) 2 refs.

Burling, William A. (AT&T Bell Lab); Bartels Lax, Barbara J.; O'Neill, Lawrence A.; Pennino, Thomas P. *AT&T Tech J* v 66 n 5 Sep-Oct 1987 p 21-38.

**085914 KNOWLEDGE-BASED SOLUTION TO THE DESIGN-FOR-ASSEMBLY PROBLEM.** A knowledge-based system to assist engineers in the process of designing products for easier assembly is presented. Contrary to other methods, the emphasis in this work is on the conceptual design stage where the structure of the product as a whole is considered. Upon completion of the analysis and design of the product structure, the system then considers the individual parts. The general methodology and architecture of the design-for-assembly system is described, followed by an example. The system was implemented in Turbo-PROLOG on an IBM-XT. (Author abstract). 5 Refs.

**Costs** See Also PRODUCTION ENGINEERING—Design Aids.

**085915 REMANUFACTURING BY DESIGN, THE MISSING LINK.** This overview of the industry proposes greater consideration of remanufacturing when designing new products for market. The time has come for American industry to expand its notion of the product life cycle to include remanufacturing. Instead of simply offering the consumer a process that goes from raw material to product to user to scrap, the concept should include the remanufacture of the product as an alternative to disposal when it becomes inoperable beyond simple repair. The remanufacturers could be the original equipment manufacturer (OEM) or an independent competitor. Regardless of who performs the function, however, its existence should be 'by design'. 13 refs.

**085916 PROFIT THROUGH DESIGN - MANAGING MID-LIFE CRISIS.** This article looks at a technique which has been used successfully to prolong product viability until the replacement can be brought to the market place. The authors have worked with a lot of companies to identify and address whatever potential exists for reduction of product costs at a late stage in product's life. The technique is a simple, four-step framework but the way in which it is used depends very much on the constraints and requirements of the particular products and markets. (Edited author abstract)

Slade, Michael J.F. (Manufacturing Services, Manchester, Engl); Thomson-Bell, Ian. *CME Chart Mech Eng* v 34 n 9 Sep 1987 p 51-52.

**085917 DESIGN-TO-COST TEAM APPROACH.** The aerospace industry needs to be cost effective in its design while improving ways to design for manufacturability. The design-to-cost (DTC) approach establishes an interdisciplinary team composed of people from industrial engineering, manufacturing engineering, test operations, procurement and logistics support. The main function of the team is to provide cost analysis data from contract inception, conduct producibility reviews and develop cost tradeoffs for the various designers. The team is also responsible for predicting, reporting and tracking the recurring unit production costs and nonrecurring tools costs.

Schehr, Leonard (Westinghouse Electric Corp, Baltimore, MD, USA). *Manuf Syst* v 5 n 12 Dec 1987 p 24-28.

**085918 DESIGN FOR ASSEMBLY: FORD'S BETTER IDEA TO IMPROVE PRODUCTS.** Three major corporate objectives at Ford Motor Co. are presented. The first objective is to improve the quality of the product. The second is to reduce the time it takes to design, develop, produce and introduce a new vehicle. The third corporate objective is to reduce costs. That runs the full gamut of reducing work-in-process, reducing raw material costs, increasing capacity usage, increasing labor utilization, and reducing warranty costs. A design and manufacturing methodology is discussed.

Miller, Frederick W. (Manufacturing Systems, Wheaton, IL, USA). *Manuf Syst* v 6 n 3 Mar 1988 p 22-24.

## Economics

**085919 PRODUCT DEVELOPMENT PROBLEMS IN 1987 - A DIAGNOSIS.** A set of 'rules' is suggested to cover the present limitations imposed on product development in public companies by the requirement of institutional investors for regularly increasing profits. (Author abstract) 5 refs.

Ashton, E.W.S. (Dunlop Ltd, Coventry, Engl). *Proc Inst Mech Eng Part B* v 201 n B3 1987 p 191-196.

## Evaluation

**085920 STATISTICAL TOOLS FOR IMPROVING DESIGNS.** The author believes statistically controlled experiments serve as a catalyst to design. These methods help engineers to build good quality into products, which should reduce the need to inspect bad quality out of them. This paper investigates statistical experimental design which includes factorial designs, fractional designs, and response surface methods. Analysis by G. Taguchi applicable to quality engineering is described. (Edited author abstract) 14 refs.

**Industrial Applications** See PRODUCTION ENGINEERING—Technology Transfer.

## Legislation

**085921 DEFENSIVE DESIGNING: ON GUARD AGAINST THE BIZARRE.** Fourteen years ago, product liability cases were being filed in federal courts at the rate of 1579 a year; by 1985, the number had risen to 13,554. The implications of such figures - a 758 percent increase in 11 years - are dramatic, throwing a shadow over the engineering profession and provoking serious questions about product safety. The paper emphasizes that if product liability lawsuits continue to mount, engineers may feel constrained to design exactly by the book and to stifle their innovative ideas.

Cortes-Comerer, Nhora (Mechanical Engineering, New York, NY, USA). *Mech Eng* v 110 n 8 Aug 1988 p 40-42.

## Management

## Mathematical Models

**085923 GENERAL MODEL OF DESIGN: FORMALIZATION AND CONSEQUENCES.** The design process may be modeled as a sequence of transitions, from an initial knowledge base to the final state which includes the desired result. In mathematical logic, this process may

be described as an initial set of axioms which are transformed into a final set of statements through a transformation process. Formalization should clarify the nature of the design process and has implications for design automation. The utility of the formal model is illustrated by interpreting it in the context of discovery in design. This is followed by a discussion of the limits to such discovery. By incorporating this model in a knowledge-based system, it may also serve as the basis for an automated designer. (Edited author abstract). 30 Refs.

**Models** See MATERIALS TESTING—Models.

**Optimization** See Also CONSUMER PRODUCTS—Optimization; ELECTRIC MOTORS, INDUCTION—Design; MECHANISMS—Design; QUALITY CONTROL; WIND TURBINES—Design.

**085924 DESIGNING FOR THE LIFE CYCLE.** The entire life of a product, as well as that of the manufacturing process and of the service system, should be considered in the original design. The life cycle of a product or system begins with the identification of a need and extends through conceptual/preliminary design, detailed design, production and/or construction, installation, customer use, support, and finally, decline and disposal. This paper reviews the actions affecting life-cycle cost.

Fabrycky, Wolter J. (Virginia Polytechnic Inst & State Univ, Blacksburg, VA, USA). *Mech Eng* v 109 n 1 Jan 1987 p 72-74.

**085925 QUALITY IN DESIGN.** This paper attempts to define a quality engineering role in the product design process. The product design process is also placed within the modern quality system. Methods of experimentation and modelling in design are emphasized and an example is described. (Author abstract) 9 refs.

Ganter, William A. (Production Automation Inc, Boulder, CO, USA). *Qual Reliab Eng Int* v 4 n 1 Jan-Mar 1988 p 4-6.

**085926 OPTIMAL DEVELOPMENT PLAN FOR NEW PRODUCTS: A CONTROL THEORETIC APPROACH.** Product quality affects a manufacturer's profitability since better quality results in a bigger market share and greater revenue. Product quality can be improved by product development which costs money. Hence to maximize total profit the development plan must be selected optimally. This paper develops a dynamic model to optimally select the development rate and timing of release to maximize discounted expected profit. (Author abstract) 4 refs.

Murthy, D.N.P. (Univ of Queensland, St. Lucia, Aust); Nguyen, D.G. *Optim Control Appl Methods* v 9 n 2 Apr-Jun 1988 p 201-207.

## Planning

**085927 STRATEGIES FOR PLANNING EXPERIMENTS USING ORTHOGONAL ARRAYS AND CONFOUNDING TABLES.** Taguchi's success in getting engineers to use experimental design techniques is due, at least in large part, to his use of tools and techniques that simplify the experiment planning process. Recognizing the advantages of this approach, this paper proposes a new set of tools, confounding tables, which offer more guidance to experimenters. Confounding tables provide a clear and systematic representation of confounding relationships. They are simple and useful tools for constructing experiment plans, and they enable users to easily evaluate the confounding patterns of a completed plan. We show how confounding tables provide more information than Taguchi's linear graphs, and are useful for a large class of experimental plans. (Edited author abstract) 13 refs.

Tsui, Kwok-Leung (AT&T Bell Lab, Holmdel, NJ, USA). *Qual Reliab Eng Int* v 4 n 2 Apr-Jun 1988 p 113-122.

**Quality Control** See Also PRODUCTION CONTROL—Management.

**085928 ESTIMATING THE ERROR OF AN EFFECT IN UNREPLICATED 2-LEVEL FRACTIONAL FACTORIAL DESIGNS.** This note develops an estimator of the experimental error based on the hypothesis that not all factor effects will be non-zero. A joint Bayesian prior distribution is presented for the experimental error variance of an effect,  $\sigma^2$ , and the probability that each effect is non-zero. From this prior distribution a posterior marginal distribution for  $\sigma^2$  is derived along with a direct estimate of  $\sigma^2$ . This method is compared with the traditional methods of estimating  $\sigma^2$  in unreplicated designs through a numerical example. (Edited author abstract) 5 refs.

**Reliability** See Also ENGINEERING—Design; QUALITY CONTROL.

**085929 OFF-LINE QUALITY CONTROL AND ILL-DESIGNED DATA.** 'Bad' data resulting from ill-designed experiments or in-production/after-production monitoring require a careful use of proper statistical techniques for their analysis. Prior exploration of the available data is of paramount importance especially if we wish to apply off-line quality control techniques such as the Taguchi method. A stepwise approach is proposed involving data analysis and straightforward significance tests, which can ensure statistically valid and useful conclusions. (Author abstract) 15 refs.

Logothetis, N. (GEC Research Ltd, Wembley, Engl). *Qual Reliab Eng Int* v 3 n 4 Oct-Dec 1987 p 227-238.

**085930 METHODOLOGY FOR PLANNING EXPERIMENTS IN ROBUST PRODUCT AND PROCESS DESIGN.** This paper presents a methodology for the problem formulation and experiment planning steps. We give practical guidelines for making key decisions in these two steps, including choice of response characteristics, and specification of interactions and test levels for variables. We describe how orthogonal arrays and interaction graphs can be used to simplify the process of planning an experiment. We also compare the experiment planning strategies we are recommending to those of Taguchi and to more traditional approaches. (Edited author abstract) 22 refs.

Shoemaker, Anne C. (AT&T Bell Lab, Holmdel, NJ, USA); Kacker, Raghu N. *Qual Reliab Eng Int* v 4 n 2 Apr-Jun 1988 p 95-103.

**085931 OPTIMIZATION OF PRODUCT AND PROCESS DESIGN FOR QUALITY AND COST.** Robust product and process design involves making the product's function much less sensitive to various sources of noise such as manufacturing variation, environmental variation and deterioration. This is a problem in optimization involving minimization of the mean square loss resulting from the deviation of the product's function from its target. Here we show that the optimization can be carried out in two steps: first maximize a quantity called signal-to-noise ratio (S/N) and then bring the performance on target by special adjustment parameters. The two-step procedure works for a wide variety of product functions and makes the optimization process more efficient and practical compared to the direct minimization of the quadratic loss function. (Edited author abstract) 7 refs.

**085932 WORST CASE PRODUCT PERFORMANCE VERIFICATION WITH ELECTROMAGNETIC INTERFERENCE TEST APPLICATIONS.** When many variables are prevalent, it is difficult systematically to identify the optimum configuration for product certification. This need can occur in areas such as testing

performance of closed-loop servo systems and testing products for electromagnetic interference (EMI). This paper proposes a test strategy to identify a 'determined worst case expected' product configuration and a criterion for pass/fail. The process was developed originally for EMI test applications; however, it can also be useful for other product performance specifications. (Author abstract) 4 refs.

Breyfogle, Forrest W. (IBM, Austin, TX, USA); Davis, Jim H. *Qual Reliab Eng Int* v 4 n 2 Apr-Jun 1988 p 183-187.

**085933 FOCUSING PRODUCT RELIABILITY PROGRAMS FOR RESULTS.** High product reliability is the consequence of good product design, high quality manufacturing, and an on-going process of problem elimination. All the elements must be present and well managed for a company to achieve a reputation for product and service excellence. Methods of measurement of product reliability are discussed. 2 refs

Potts, George W. (Occam Research Corp, Wellesley, MA, USA). *Manuf Syst* v 6 n 6 Jun 1988 p 28-30, 32-35.

**085934 LOAD-STRENGTH SIMULATION OF PLASTIC MOULDINGS.** The basic idea behind the load-strength theory is that a component or a system will fail exactly at the moment the load exceeds the strength. Load and strength are both modelled by distribution curves (probability density functions). The load-strength theory is used to simulate the relations between the reliability, the safety factors used in the mechanical design and the different material conditions caused by batch variations in raw material, the injection moulding process and the mould design. (Edited author abstract). 9 Refs.

**Standards** See TRAFFIC SIGNS, SIGNALS AND MARKINGS—Equipment.

**Testing** See Also PACKAGING—Shock Problems.

**085935 MORE SHIPPING ENVIRONMENT KNOWLEDGE MAKES THE ELECTROHYDRAULIC VIBRATOR AN INDUSTRIAL STANDARD.** Given that transporting a product from the manufacturer to the end user causes the most severe stresses during the product's life cycle, there has been greater emphasis on measuring the shipping environment. In parallel with the development of ASTM test methods, electrohydraulic (EH) vibration test systems have evolved to meet test requirements. Electrohydraulic vibration systems have become an industrial standard because they meet the needs of this field so well. In so doing they have helped to: 1) improve product reliability due to reduction of shipping damage; 2) reduce packaging costs by reducing the incidence of overpackaging where it is unnecessary; and 3) bring new products to market faster by eliminating the need for trial shipment of pilot production runs. 6 refs.

**Weight Control** See BOTTLES—Glass.

**PRODUCT LIABILITY** See Also BIOMEDICAL ENGINEERING—Computer Applications.

**085936 PRODUCT LIABILITY - THE ROLE OF PRODUCTION MANAGERS.** Author describes the new laws, which become operative in October (Part II) and January 1988. No production manager reading this article will doubt the necessity to involve a wide range of management functions - from procurement to sales - in steps to improve safety and liability management in his or her organisation. One of the key successes an industrial or technical manager might have to achieve in adapting to the new legal regime is to convince colleagues in other departments - especially in the areas of contracts, procurement, marketing, sales, service and record keeping - of the essential roles which these must perform.

Mackmurdo, Robert. *Prod Eng (London)* v 66 n 8 Sep 1987 p 14-15.

**085937 BETTER SAFE THAN SORRY.** New legislation making producers strictly liable for any damage caused by defective products will be introduced this year in the U.K. This article explains the implications for design managers and outlines a strategy for dealing with this new responsibility. Subjects covered include risk management, design reviews, and others.

Abbott, Howard (Product Safety, Kingston Upon Thames, Engl). *Engineering (London)* v 228 n 2 Feb 1988 p 65-69.

**085938 MANAGING PRODUCT LIABILITY RISKS.** The author discusses a strategy to minimize risk. The first stage in carrying out a risk management plan is to decide what product liability risks exist, assess how product hazards are created and what the consequences of such hazards are. The assessment of risks can be carried out in a variety of ways and will be largely dependent on the product and the industry involved. A set of guidelines is given.

Farnsworth, Norman (Leyland DAF, Engl). *Prod Eng (London)* v 67 n 2 Feb 1988 p 28-30.

**085939 PRODUCT LIABILITY.** This paper starts by going over the present position with regard to civil liability for loss and damage caused by a defective product. It then describes the object of Part 1 of the Consumer Protection Act, 1987, following which its looks at that part of the Act in some detail. The paper concludes by looking at some practical matters which have been of interest to various groups.

Paton, A.J. (Pinsent & Co). *Br J Non Destr Test* v 30 n 3 May 1988 p 191-195.

**085940 PRODUCT LIABILITY: EUROPE'S QUALITY CHALLENGE.** Recent product liability developments in the European Economic Community may affect U.S. exporters as well as U.S. legislation. In an attempt to introduce uniformity and stability into the law of product liability, the U.S. Department of Commerce published the Model Uniform Product Liability Act in 1979. It was offered for voluntary use by the states, with limited success. A number of product liability reform bills have also been introduced in Congress, but these have made little progress. This article presents product liability issues from a European standpoint, with an emphasis on quality control. 10 refs.

Roche, John G. (Univ Coll, Galway, Irel). *Qual Prog* v 21 n 6 Jun 1988 p 61-63.

**085941 LITIGATING TOXIC SHOCK SYNDROME: LESSONS TO BE LEARNED.** An analysis of West versus Johnson & Johnson Products, Inc., an important case involving toxic shock syndrome, was performed in order to determine if any lessons could be learned that would be applicable to toxic tort litigation in general. A detailed analysis of the facts of the case as well as background on toxic shock syndrome is presented. A number of important conclusions were drawn, concerning (1) manufacturer liability arising out of a design effect theory involving a product which is, by itself, relatively sterile and chemically inert, (2) defective warning (as distinct from failure to warn), and (3) punitive damage liability arising from inadequate testing. These conclusions should assist certain manufacturers to minimize their exposure in toxic tort litigation, particularly to punitive damages. The failure to introduce proper defense theories during trial is also discussed. (Author abstract). 7 Refs.

## Economics

**085942 ON PRODUCT LIABILITY AND QUALITY CONTROL.** Product liability is one of the most costly and confusing problems facing manufacturing today. Models of the economic impact of both final

acceptance sampling and process control on liability risk due to a manufacturing defect are presented. A numerical example reveals that selection of cost-effective quality control methods depends on assumed disposition of rejected lots. (Author abstract) 22 refs.

## Legislation

**085943 MOTORCYCLE HELMETS: ESTABLISHING PRODUCT LIABILITY.** Even if a helmet complies with governmental standards, evaluation of its shock-absorbing characteristics may show that it is defective. Various considerations are explained that provide a basis for establishing product liability in cases where severe head injuries have resulted from the use of an unduly hard liner. For this purpose it must be established that the subject liner would exhibit a relatively small compressive distance under the conditions of the standardized test; the severity of the impact in the subject case is not significantly greater than in the standardized test.

Ryder, Frederick L. (New York Univ, New York, NY, USA). *J Prod Liability* v 11 n 2 1988 p 69-71.

**085944 COLLOQUIUM ON LIVING WITH THE EEC DIRECTIVE ON PRODUCT LIABILITY: MANAGEMENT, DESIGN AND MANUFACTURING ISSUES.** This colloquium proceedings contains 5 articles, one in abstract form only, on the EEC directive on product liability. Subjects include: practical implications for the practicing engineer; consumer viewpoint on product liability; product liability and contract research/development; management/design/manufacturing issues; and product safety in appliances. Technical and professional papers from this conference are indexed and abstracted with the conference code no. 11334 in the Ei Engineering Meetings (TM) database produced by Engineering Information, Inc.

Anon (IEE, Management & Design Div, London, Engl). *IEE Colloq Dig* n 1987/19, Colloq on Living with the EEC Dir on Prod Liability: Manage, Des and Manuf Issues, London, Engl Feb 3 1987. Publ by IEE, London, Engl, 1987 var pagings.

## United Kingdom

**085945 QUALITY MANAGEMENT - THE IMPACT ON PROFIT AND PRODUCT SAFETY.** Manufacturers are recognizing that quality is critical to success in today's complex and competitive international market place. In the UK the Consumer Protection Act 1987 comes into effect from March this year. It and similar laws throughout the EEC strengthen existing legislation to make it easier to claim liability from a producer or supplier of a defective product that causes death or injury or damage in the home. Absence of negligence will no longer be a defence; a producer will have to demonstrate that the product was not defective at the time of its sale or that it has been manufactured according to specification. To do so, modern quality management methods must be used, allied to recording of the design, production and distribution processes.

Leegood, Steve (Logica Energy & Industry Systems, Engl). *Prod Eng (London)* v 67 n 2 Feb 1988 p 36-37.

**085946 SIMULTANEOUS DETERMINATION OF PRODUCTION CYCLE AND INSPECTION SCHEDULES IN A PRODUCTION SYSTEM.** This paper addresses the problem of joint control of production cycles or manufacturing quantities and maintenance by inspection. A simple relationship has been developed to determine the effectiveness of maintenance by inspection. Furthermore, when maintenance by inspection is adopted, it is shown that the optimal inspection intervals are equally-spaced. The problem of simultaneous determination of EMQ (Economic Manufacturing Quantity) and the inspection schedules is solved by using an approximation to the cost function. The resulting EMQ is found to be an adjustment to the classical EMQ. Finally, the relationships between different parameter values and the magnitudes of the cost penalty for using the classical EMQ are examined. 22 refs.

**085947 FREEZING THE MASTER PRODUCTION SCHEDULE UNDER ROLLING PLANNING HORIZONS.** The stability of the Master Production Schedule (MPS) is a critical issue in managing production operations with a Material Requirements Planning System. This paper examines three decision variables in freezing the MPS: the freezing method, the freeze interval length, and the planning horizon length. Simulation experiment results are reported which suggest that freezing up to 50% of the planning horizon has a marginal effect on production and inventory cost under a wide range of operating conditions. These results also suggest that an order based freezing method produces superior results in comparison with a period based method. (Edited author abstract) 21 refs.

Sridharan, V. (Clemson Univ, Clemson, SC, USA); Berry, William L.; Udayabhanu, V. *Manage Sci* v 33 n 9 Sep 1987 p 1137-1149.

**085948 STUDY OF GRAPHICAL AND TABULAR DISPLAYS AND THEIR INTERACTION WITH ENVIRONMENTAL COMPLEXITY.** Since most interactive systems use either graphical or tabular displays, this experiment contrasts the effectiveness of the two displays in making the production scheduling decision in low and intermediate levels of environmental complexity. The study concludes that tabular aids outperform the graphical aids in environments with low complexity, replicating an earlier study. In intermediate complexity environments, the graphical aids outperform the tabular aids. These findings may resolve many conflicts in the literature on data displays. (Author abstract) 25 refs.

Remus, William (Univ of Hawaii, Honolulu, HI, USA). *Manage Sci* v 33 n 9 Sep 1987 p 1200-1204.

**085949 PULL VERSUS PUSH STRATEGY FOR AUTOMATED GUIDED VEHICLE LOAD MOVEMENT IN A BATCH MANUFACTURING SYSTEM.** Most automated guided vehicle (AGV) dispatching rules reported in literature to date are based on the attributes of the vehicles and the workcenters from where the loads originate. An algorithm that assigns load movement priority based on the demand states of the load destinations is presented. When applied to the material flow of an illustrative shop, analysis indicates that the algorithm performs competitively with some of the best source driven rules currently reported. It also provides a material flow and workcenter priority assignment flexibility not matched by any source-based rules. (Edited author abstract) 11 refs.

Egbelu, Pius J. (Pennsylvania State Univ, University Park, PA, USA). *J Manuf Syst* v 6 n 3 1987 p 209-221.

**085950 DESIGN AND OPERATION OF A MULTICOMMODITY PRODUCTION/DISTRIBUTION SYSTEM USING PRIMAL GOAL DECOMPOSITION.** An optimization-based decision support system has been developed and used by NABISCO to manage complex problems involving facility selection, equipment location and utilization and manufacture and distribution of products. Excellent quality solutions for problems with more than 40,000 variables (including several hundred binary variables with fixed charges) and in excess of 20,000 constraints require only 0.6 megabytes region and less than one compute minute on a time-shared IBM 3033 computer; average problems (with fewer binary variables) require only a second or two. (Edited author abstract) 8 refs.

Brown, Gerald G. (US Naval Postgraduate Sch., Monterey, CA, USA); Graves, Glenn W.; Honeczarenko, Maria D. *Manage Sci* v 33 n 1 Nov 1987 p 1469-1480.

**085951 TIME-OPTIMAL PRODUCTION CONTROL IN A MANUFACTURING SYSTEM.** This study demonstrates the use of control engineering techniques to regulate the product inventory levels of a workshop in a manufacturing system by manipulating the number of machines and the labor time employed during production. The production policy that minimizes the production time is obtained by time-optimal control techniques. (Author abstract) 8 refs.

**085952 PRODUCT REALIZATION SYSTEMS.** The product realization process is the way in which AT&T moves from technology in the laboratories to products in the hands of customers. The goal of the process is customer satisfaction. Important features of this process include: (a) high productivity, enabling the company to meet its financial targets; (b) short intervals, to match the needs of the market; and (c) high quality levels, to meet or exceed customer expectations. (Author abstract) 6 refs.

Boza, Luis B. (AT&T Bell Lab, Holmdel, NJ, USA); Powers, Tom L. *AT&T Tech J* v 66 n 5 Sep-Oct 1987 p 3-4.

**085953 MAP IS REAL BUT...** Proponents have hailed the Manufacturing Automation Protocols (MAP) as the key to automation for years now. But actual installations are still few. MAP is probably the answer for some applications, but there are alternatives as well.

Krepchin, Ira P. *Mod Mater Handl* v 42 n 14 Dec 1987 p 101, 103-104.

**085954 CMMs CUT COSTS AND STREAMLINE QC.** Coordinate measuring machines (CMMs) first emerged during the 1960s in response to demand for three-dimensional accuracy, gaging flexibility, faster turn-around time, and less production downtime during inspection. CMMs work by passing a probe over a part's feature and finding the displacement along each of three measurement axes. The machine transmits these measurements to a central processing unit which compares the values to programmed specifications.

Deller, Hans (Numerex Corp.). *Mach Tool Blue Book* v 83 n 1 Jan 1988 p 48-50.

**085955 COORDINATE MACHINES CHECK QUALITY DRIFT.** Coordinate measuring machines are becoming necessary in enabling the production shop to comply with stringent quality specifications. As manufacturing industry approaches the 1990s the CMM is acquiring a new significance. It is no longer just the question of how fast one can measure a component, how quickly one can process the data or how soon statistical process control (SPC) can display a trend. The CMM is becoming an essential instrument in the qualification of tooling and fixturing to maintain higher accuracies for automation systems and satisfy the requirements of national and international quality assurance standards.

Page, Mike. *Metalwork Prod* v 132 n 1 Jan 1988 5p between p 46 and 53.

**085956 ON UPPER BOUNDS OF SEQUENTIAL STOCHASTIC PRODUCTION PLANNING PROBLEMS.** Consider a class of problems that determine production, inventory and work force levels for a firm in order to meet fluctuating demand requirements. A production planning problem arises because of the need to match, at the firm level, supply and demand efficiently. In practice, the two common approaches to counter demand uncertainties are (i) carrying a constant safety stock from period to period, and (ii) planning with a rolling horizon. We derive two a priori upper bounds on the costs for a class of production planning problems under the rolling horizon strategy. These upper bounds are derived by establishing correspondences. We propose refinements to the non-Lagrangian bounds and present limited computational results. (Edited author abstract) 9 refs.

**085957 ANFORDERUNGEN AN DIE BEREITSTELLUNGSPLANUNG VON WERKZEUGEN IN EINER FERTIGUNGSSTEUERUNG.** [Requirements Imposed on Availability Planning of Tools in a Production Control System]. Rapid changes in market requirements have in the recent years also brought about distinct changes in weighing the objectives of production control, with the aims of just-in-time production and short production runs being in the foreground today. This is why many production control systems fail to give full satisfaction in spite of high investments. The major reasons for this are to be found in treating production control as an isolated solution, in a deterministic instead of stochastic view taken of the production process, and in the nonexistence of appropriate parameters and approaches for exerting a direct influence on production run times and inventories. (Edited author abstract) In German. 8 refs.

Wiendahl, H.-P.; Ullmann, W. *Werkstatt Betr* v 121 n 2 Feb 1988 p 133-136.

**085958 TRANSPORTATION TYPE AGGREGATE PRODUCTION MODEL WITH BOUNDS ON INVENTORY AND BACKORDERING.** We consider a certain T period aggregate production planning model, where the two sources of production are regular and overtime. The model allows for time varying production, holding and backordering costs and includes bounds on inventory and backorders. We show that the problem has a rather interesting network structure and exploit this structure to develop a greedy algorithm to solve the problem. The procedure is easy to implement and has a computational complexity of  $O(T^2)$ . We report computational experience with the greedy procedure and demonstrate its superiority to a well known network simplex code, GNET, implemented on the classical network formulation of the problem. (Author abstract) 14 refs.

**085959 COMPONENT COMMONALITY WITH SERVICE LEVEL REQUIREMENTS.** A model is formulated for an arbitrary number of products with general joint demand distribution. The results obtained are not all intuitive. While utilizing commonality is beneficial, nothing general can be said about the resulting change in the components' stock levels. When the cost structure is of a particular simple form, though, some interesting general patterns do emerge. We also discuss the case of using a service-level measure where rationing of common components might be required, and characterize the implied rationing rule. (Edited author abstract) 11 refs.

Gerschak, Yigal (Univ of Waterloo, Waterloo, Ont, Can); Magazine, Michael J.; Gamble, Bruce A. *Manage Sci* v 34 n 6 Jun 1988 p 753-760.

**085960 PRODUCTION CONTROL OF A MANUFACTURING SYSTEM WITH MULTIPLE MACHINE STATES.** The production control of a single-product manufacturing system with arbitrary number of machine states (failure modes) is discussed. The objective is to find a production policy that would meet the demand for the product with minimum average inventory or backlog cost. The optimal production policy has a special structure and is called a hedging-point policy. If the hedging points are known, the optimal production rate is readily specified. Assuming a set of tentative hedging points, the simple structure of the optimal policy is utilized to find the steady-state probability distribution of the surplus (inventory or backlog). Once this function is determined, the average surplus cost is easily calculated in terms of the values of the hedging points. This average cost is then minimized to find the optimum hedging points. 5 refs.

**085961 ON THE DEVELOPMENT OF PRODUCTION AND MATERIAL CONTROL SYSTEMS IN A CORPORATION ORGANIZED INTO PROFIT CENTERS.** The present paper deals with the problems involved in the development of control systems for production and material management and the solutions we have adopted, as well as some, as yet, unsolved problems. The subject of this report is an electronics corporation, formed by a Finnish and a Swedish company, which is organized into relatively independent profit centers, each with its own products and factories. The goal was set to develop control systems by which one would achieve the following: a low level of current assets from the corporation as a whole; the flexible use of production resources; the advantage of largeness in purchasing operations; the benefits of rationalization in administrative functions. The nature of our analysis and solution model is more practical than theoretical. (Author abstract) 3 refs.

**085963 AUTOMATED SYSTEM FOR CONTROLLING THE PRODUCTION PROCESS OF WIRING BY TWISTING.** The central computer of this computer-aided manufacturing system is a Elektronika-60M microcomputer with additional devices. The computer-aided manufacturing system includes two subsystems: twisting-device control and monitoring of finished wiring. The twisting control object is a type MPA-2 device, which in simplicity of design approaches is similar to those used for manual twisting, but is devoid of the inherent drawbacks. The type U322 wiring monitoring automatic unit provides for registration and printout of all wiring errors of the 'break' or 'unnecessary link' types; automatic printout of table of links; detection of contacts coupled with specified contact (at operator's request). The com-

puter-aided manufacturing system developed permits simultaneous control of five MPA-2 devices and one U322 automatic unit.

**085965 KNOWLEDGE BASED ROUTING AND SEQUENCING FOR DISCRETE PART PRODUCTION.** This paper describes an experimental knowledge based routing system, named KBRS, for computer aided manufacturing and assembly facilities. The knowledge based system is composed of five parts: a static database, a dynamic database, behavioral knowledge, procedural knowledge, and a simulation driver. A second level of knowledge observes the system and tunes it according to known observed behavioral evidence. The KBRS is simulated and compared with six static routing policies and an interactive human scheduler. The KBRS outperforms the other routing policies. (Author abstract) 19 refs.

**085966 PRODUCTION CONTROL AID FOR MANAGERS OF MANUFACTURING PLANTS.** An interactive computer model in a scheduling and modeling package being developed for small and medium-sized manufacturing plants is described. There are four main uses of the model. First, the model can simulate in detail the running of a given schedule to verify that assumptions made by the scheduler are valid. The scheduler and the model will interact to arrive at a feasible schedule. Secondly, the plant manager can run through tomorrow's schedule on the model and identify potential trouble spots. Thirdly, in actually executing today's schedule, the manager can use the model to respond to machine breakdowns and other unscheduled occurrences. Finally, the model can be used to evaluate 'what-if' type situations, where the impact of different facility layouts, manpower levels, number of shifts used, etc., can be investigated. (Author abstract) 7 refs.

## Computer Integrated Manufacturing

**085968 DATA COLLECTION-TAKING AIM AT THE I OF CIM.** The results of a recent survey on factory data collection and management systems, conducted by Automation Research Corp. (ARC) of Medfield, MA, show several trends in data collection and application. For example, bar codes are the preferred technology for automated identification, but newer technologies such as radio frequency identification and voice recognition are becoming more common on the factory floor. While standardized data collection software packages are increasingly available, many users are looking to plantwide collection systems and networked equipment requiring significant vendor/user interaction in the development stages. Finally, the ubiquitous personal computer and its siblings are becoming a factor in the factory as terminal controller, data host, network server or terminal emulator. The preferred operating system for the microcomputer is Unix, particularly on the Digital Equipment Micro-VAX and IBM's 80386-based PS/2 systems.

**Economics** See Also QUALITY CONTROL—Costs; SCHEDULING—Mathematical Models.

**085974 ECONOMIC DESIGN AND CONTROL OF MONITORING MECHANISMS IN AUTOMATED PRODUCTION SYSTEMS.** Inspection as well as restoration capabilities are necessary to provide early detection and correction of shifts in the production process. This paper considers the costs of different policies for providing these detection and restoration capabilities. These policies amount to periodic or continuous inspection of the production process with perfect information, and continuous or periodic availability of maintenance facilities. The optimal operation of each policy is studied. Comparative analyses are conducted with different specifications of key parameters such as the rate of shift of the process and the cost of producing defective items. These analyses enable the derivation of the optimal policy when only ranges of the values of these parameters are known. (Edited author abstract). 32 Refs.

**Inspection** See Also QUALITY CONTROL—Sampling; STEAM GENERATORS—Reliability.

**085975 SHOPFLOOR METROLOGY PRACTICE CUTS DELAY AND BOOSTS PROFIT.** A surface texture analysis system designed by Rank Taylor Hobson, of Leicester, is being used to great effect in the measurement of cylinder bores, by a leading British combustion engine manufacturer. With the new cylinder block surface, texture measuring system, random blocks are diverted from the main production line into a lay-by station where bore inspection procedures are quickly carried out, after which the cylinder block is simply fed back into the main production line as required. The measuring head of the system incorporates two vertically mounted pick-ups in a cylindrical section plug which is manually inserted into the cylinder bore. Spring-loaded rollers, mounted diagonally,

nally oppose each pickup, ensure conformity of pressure against the bore wall. The design and construction of the plug allows the measurement of a number of different bore diameters to be accommodated.

Anon. *Ind Lubr Tribol* v 40 n 1 Jan-Feb 1988 p 16-17.

**085976 CASE FOR CMMs.** The author cites some factors which make the question of whether or not to purchase a coordinate measuring machine (CMM) not one of justification but one of survival. It is shown that the use of a CMM makes it possible to achieve very tangible savings while meeting the more exacting requirements of customers. In addition, a CMM improves inspection accuracy by minimizing human influence. CMM prices have been relatively stable for the past few years, while accuracy and speed have improved significantly, especially in the moderate- and high-accuracy machines. Intense competition and aggressive technical development have made today's CMM a better value than ever before.

**085978 POLITICS OF CHANGE IN MANUFACTURING.** We can now set forth the specifics of applying political science to the management of a change process within manufacturing. The psychology and politics of effectively relating with seniors, peers, and subordinates must be combined with the dynamics of a change process spanning the entire manufacturing system. Each issue area must be thought through in terms of the specific needs for administrative support and leadership, enabling decisions, technical know-how, cooperation, convincing, credit sharing, security, involvement, and expert operating knowledge. (Author abstract) 13 refs.

Bell, Robert R. (Tennessee Technological Univ, Cookeville, TN, USA); Burnham, John M. *Prod Invent Manage* v 28 n 2 Second Quarter 1987 p 71-78.

**085979 CHANGES WORTH MAKING - MANAGING THE MUNDANE.** This is an example of how managers can improve productivity, quality, service, and inventory turns by what appear to be ordinary procedures. Working on this project has been refreshing because it has confirmed that managing the uncommonly ordinary - the mundane - yields good returns. The day-to-day stuff -

sharing individual expectations; meeting to develop joint understandings; setting work unit and interdepartment targets; scheduling regular follow-up reviews work unit and interdepartment targets; scheduling regular follow-up reviews to discuss progress on the plan; and making gradual change - will improve productivity. The answer to business problems lies in the subtle process of getting business men and women to implement these practices.

Marek, E. William (Brigham Young Univ, Provo, UT, USA). *Prod Invent Manage* v 28 n 2 Second Quarter 1987 p 104-109.

**085980 PRODUCTION AND OPERATIONS MANAGEMENT TECHNIQUES IN MANUFACTURING: COMPARING THE UNITED KINGDOM AND THE UNITED STATES.** The survey upon which this work was based sought to establish production managers' areas of responsibility, the use pattern of several techniques, and the reasons why some techniques are used rarely. Thirty-five widely promulgated techniques were grouped into eight categories for the purpose of the survey. The questionnaire used in this work was designed (1) to establish main areas of responsibility of the production managers in the manufacturing industry, (2) to discover use patterns of several proven production management techniques, and (3) to investigate the reasons for no or low usage. Only those techniques that were shown from previous studies to be most likely to be used were included in the survey. They were divided into two groups. 35 refs.

Oakland, John S. (Univ of Bradford Management Cent, Bradford, Engl); Sohal, Amrik. *Prod Invent Manage* v 28 n 3 3rd Quarter 1987 p 12-16.

**085981 USE OF OPERATIONS RESEARCH IN PRODUCTION MANAGEMENT.** The results of a survey of large U.S. industrial firms indicates high use of operations research techniques in the application areas of scheduling, forecasting, and advertising sales research. The heavily used techniques are regression analysis, linear programming, and simulation. Several techniques declined in use over the last ten years, including project planning/control and inventory analysis control. 6 refs.

**085982 DYNAMIC PLANNING TECHNIQUE FOR CONTINUOUS ACTIVITIES UNDER MULTIPLE RESOURCE CONSTRAINTS.** The solution technique developed integrates the simplex search algorithm into the recursive calculations of dynamic programming in order to mitigate the 'curse-of-dimensionality.' Since differentiation is not required as a means of optimization procedure, it is expected that this technique will have an important impact on planning problems, such as the multiple resource allocation problems which involve nondifferentiable and/or highly nonlinear performance functions. Applications of the technique to very complex problems seem to confirm the anticipated polynomial average performance. (Edited author abstract) Refs.

**085983 CREATING A MANUFACTURING STRATEGY TO SUIT YOUR BUSINESS.** The development of manufacturing strategy requires approaches and techniques different from those used in the past. To play its proper role in establishing competitive advantage, the contribution of manufacturing must be recognized explicitly and exploited in conjunction with marketing, design and purchasing. Strategy and implementation are inseparable, and are a vital force in overcoming resistance to change. (Author abstract) 4 refs.

Pendlebury, A. John (Coopers & Lybrand Associates Europe). *Long Range Plann* v 20 n 6 Dec 1987 p 35-44.

**085984 MANAGERIAL FOCAL POINTS IN MANUFACTURING STRATEGY.** Data were collected by mailed questionnaires as a part of a large research project-

'Manufacturing Futures'. The responses to a list of 35 specific current action programmes in manufacturing were reduced through a principal component analysis to eight factors. We have labelled the factors as action flexibility, changing role of workforce, quality, information systems, upkeep of existing systems, re-sizing the structure, automation, and product-process adjustments. We interpret them as the dimensions which reflect the focal points of attention of management as judged from implemented manufacturing strategies. On the basis of this analysis, we recommend explicit management attention to eight questions while formulating a manufacturing strategy. (Edited author abstract) 22 refs.

**085985 FMS AS INDICATOR OF THE STRATEGIC ROLE OF MANUFACTURING.** Statistical analysis of questionnaire data from 163 large European manufacturers show that those who put high emphasis on the development of flexible manufacturing systems (FMS) also pay more attention to many other elements in the management of their production systems. The authors hypothesize that FMS is management of their production systems. The authors hypothesize that FMS is being used, apart from its technological benefits, as a managerial tool for pushing new modes of thinking and performance in production, with the underlying objective of upgrading the strategic role of manufacturing in the company. (Author abstract) 14 refs.

Ferdows, Kasra (INSEAD European Inst of Business Administration, Fontainebleau, Fr); Lindberg, Per. *Int J Prod Res* v 25 n 11 Nov 1987 p 1563-1571.

**085986 MANUFACTURING STRATEGIES IN SWEDEN.** A survey of 125 Swedish manufacturing companies has shown that they tend to follow a product oriented strategy expressed by a high emphasis on the development of new products and a high level of innovation. The business units primarily compete with high quality, high performance products, and dependable deliveries. Altogether this puts high demands on the manufacturing processes utilized. The relationship between the production processes and the degree of product standardization is relatively low, and manufacturing concerns are to some extent grouped around these matters. Companies facing these concerns tend to emphasize programs dealing with worker motivation, focusing factories and efforts concerning improvement of process quality. (Author abstract) 15 refs.

Horte, S.A. (Inst for Management of Innovation & Technology, Goteborg, Swed); Lindberg, P.; Tunalyv, C. *Int J Prod Res* v 25 n 11 Nov 1987 p 1573-1586.

**085987 GENERIC BILLS OF MATERIALS IN ASSEMBLE-TO-ORDER MANUFACTURING.** For every customer order, the functional specifications which define a product that suits the customer's needs have to be determined. In order to define a bill-of-material (BOM) for every new customer order, these functional specifications have to be related to the engineering characteristics. This requires considerable knowledge about the product and its potential specifications. To support this error-prone task a generic BOM describes a range of products implicitly instead of enumerating the products individually. The importance of the use of a generic BOM is illustrated. The essence of the generic BOM is explained briefly and some of the problem in determining the suitability of a generic BOM are discussed. (Edited author abstract) 7 refs.

**085988 MANAGING PRODUCTION FOR CUSTOMER SERVICE AND PLANT EFFICIENCY.** The primary target of production management has been

capacity utilization, and many companies have incentives, reporting and accounting which focus on capacity efficiency as a primary measure of performance. The author believes that customer service should be the primary objective of production management efforts. This belief is based on two studies: a questionnaire based analysis of production situations at the beginning of this decade (117 plants) and a recent case study based deep analysis (10 case plants and 20 reference plants) in medium-to-small-size industries. Because of the modest size of the samples, the conclusions made should be generalized with caution. 4 refs.

Eloranta, Eero (Helsinki Univ of Technology). *Ind Eng (Norcross GA)* v 20 n 3 Mar 1988 p 36-38, 40.

**085989 THAT'S A GOOD IDEA, BUT...** The article examines how it is to get a group of workers involved in a new system. The method starts with determining goals in an unconstrained environment (described). From this point, the participants address organizational strengths and limitations on a personal basis, and finally move toward steps that can actually be taken in the short term.

Ettkin, Lawrence P. (Univ of Tennessee/Chattanooga, Chattanooga, TN, USA). *Prod Invent Manage J* v 28 n 4 1987 p 48-49.

**085990 HOW STUDENTS PERCEIVE THE BENEFITS OF STUDYING PRODUCTION AND OPERATIONS MANAGEMENT.** The study polled both graduate and undergraduate college students. They were also asked to list the benefits they had expected to gain, and felt they had gained, from taking such courses. The reasons ranged from exposure to technology, learning decision skills, and familiarity with terminology, to enhancing career opportunities, increasing intracompany cooperation, and reestablishing the United States' international industrial status.

Ala, Mohammad (California State Univ, Los Angeles, CA, USA). *Prod Invent Manage J* v 28 n 4 1987 p 71-74.

**085991 FAILURES CAN'T BE ELIMINATED, BUT MAINTENANCE COSTS CAN BE MINIMIZED.** This is the second in a two-part installment on how to improve production economics with plant engineering decisions. The author emphasizes that failures cannot be eliminated but maintenance costs can be minimized. He explains this through a discussion of engineering costs; labor overhead; relating costs to benefits; and system implementation.

Brown, Edward (Halcyon Corp). *PIMA Mag* v 70 n 3 Mar 1988 p 31-33.

**085992 APPROACH TO COMPUTER INTEGRATED PRODUCTION MANAGEMENT.** Computer integrated manufacturing (CIM) can never be constructed just by combining the automated devices available at present, such as CAD, CAM, CAPP and MRP systems. To realize successful CIM, the automation of friendly communication between experts is required, which plays a most important role in the integration of the various functions of production management. This points to the importance of computer integrated production management. In order to confirm the validity of the paradigm proposed in this paper, a prototype in process planning has been developed which aims at integration with CAD. (Edited author abstract) 7 refs.

Ando, K. (Inst of Technology, Ohmiya, Jpn); Takeshige, A.; Yoshikawa, H. *Int J Prod Res* v 26 n 3 Mar 1988 p 333-350.

**085993 PRODUCTION IN THE FACTORY OF THE FUTURE.** There is much discussion of the general decline of smokestack industries worldwide with some notable exceptions. These exceptions sought manufacturing efficiency improvements in order of magnitude higher than previously achieved. It is now clear that the future belongs to the factory with computer technology at its core. Production in a computer supported factory is very different. The support functions and the factory itself operate like a well-oiled machine. This paper shows where

manufacturing is headed and the changes needed in management practices to make automated, computerized manufacturing possible. (Edited author abstract)

Plossl, Keith R. (George Plossl Educational Services, Marietta, GA, USA). *Int J Prod Res* v 26 n 3 Mar 1988 p 501-506.

**085994 FLEXIBLE DESIGN OF PRODUCTION PLANNING SYSTEMS.** The paper discusses future production systems with emphasis on new production management concepts. Planning problems are identified. Computer applications in the fields are briefly explained. The main part of the paper discusses basic operations in production management. These are operations invariant to different applications and will thus serve as truly modular building blocks in a computer based production management system. The data structures involved are discussed and a list of operations proposed. (Author abstract) 6 refs.

Rolstadas, Asbjorn. *Int J Prod Res* v 26 n 3 Mar 1988 p 507-520.

**085995 OBJECT ORIENTED PROGRAMMING IN PRODUCTION MANAGEMENT - TWO PILOT SYSTEMS.** This paper discusses artificial intelligence (AI)-oriented production management systems using object oriented programming. The two pilot systems described here are both implemented using the Smalltalk-80 programming environment. One of the systems concerns production flow analysis. The merits of object oriented programming in the design of the user interfaces are emphasised. The flexibility of the object oriented approach for stepwise development has been observed. Simulation method as a communication tool is used in both systems and the applicability of Smalltalk in simulation is demonstrated. (Edited author abstract) 9 refs.

Alasuvanto, Jari (Helsinki Univ of Technology, Finl); Eloranta, Eero; Fuyuki, Masahiko; Kida, Tomoyuki; Inoue, Ichiro. *Int J Prod Res* v 26 n 5 May 1988 p 765-776.

**085996 PRODUCTION AND INVENTORY MANAGEMENT AND STRATEGY FIELDS - A CASE FOR MORE DIALOG.** The author makes a case for more communication between production and inventory managers and strategists. In particular, he suggests that a full assessment of the competitive forces that underlie a company's industry and a knowledge of its own and its competitors' basic strategies should be important considerations in demand management, resource planning, and production planning. Industry analysis should be at the front end of the manufacturing resources planning (MRP-II) flow chart. 13 refs.

**085997 INTEGRATED PRODUCTION-INVENTORY MODEL WITH REPROCESSING AND INSPECTION.** Cost and quality levels of production systems are addressed via a model that synthesizes several potential features of production systems: production processes, quality control procedures, in-process inventory and reprocessing. For any specified inspection configuration the model can be used, for serial production systems, to obtain closed-form expressions for two important decision variables: optimal lot size and reprocessing batch size, which minimize the total system costs. A numerical example highlights the interdependencies and the role of various system features in determining the values of the decision variables and hence in reducing the total costs. The paper also discusses the managerial implications of the model. (Edited author abstract). 14 Refs.

**086000 COMPUTATION OF THE MAKESPAN IN A TRANSFER LINE WITH STATION BREAKDOWNS USING STOCHASTIC PETRI NETS.** The authors developed a Petri net model of a transfer line, whose machines are subject to failure, considering both blocking and rerouting of workpieces when a machine fails. The introduction in the net of the marked token is shown to allow the computation of the makespan of the system. The authors describe how to model production processes by stochastic Petri nets. It is shown how stochastic Petri Nets (SPN) can be modified introducing a 'marked token' in order to compute the makespan: details of the marked token method are given and worked out in a simple example. A model of a transfer line is presented, in which service, failure and repair times are assumed to be exponential; for this problem the mean value of the makespan under different control policies of a workpiece is computed, using the marked token technique. (Edited author abstract) 12 refs.

**086001 LEAST-COST RATIONS AND OPTIMAL LIVESTOCK FEEDING POLICY.** In evaluating feeding policy in livestock production, it is generally assumed that an optimal feeding policy will involve using least-cost rations throughout the production process. It is demonstrated that this assumption may not be valid when the supply of some of the feedstuffs used for livestock feeding is limited. A method for testing the validity of this assumption is presented for a linear programming model of an integrated crop and intensive beef production enterprise in which some of the crops may be used for livestock feeding, and an iterative solution procedure is proposed for cases where this assumption is not valid. (Author abstract) 7 refs.

**086002 DETERMINISTISCHES MODELL ZUR BESTIMMUNG OPTIMALER PRODUKTIONS- UND INSTANDHALTUNGSZYKLEN.** [Deterministic Model for Determining Optimal Production and Maintenance Cycles]. Means of production with gradually decreasing efficiency have to be put out of operation periodically to remove the cause of this decrease, such as wear and tear, and formation of crusts. This leads to downtimes which in turn result in loss in production. Hence determination of cycles of maintenance and cleaning is an optimization problem. A general mathematical model is presented, and a practical approach of optimization is demonstrated by the example of a chemical plant. (Edited author abstract) In German. 4 refs.

**086003 STRATEGIC SUBCONTRACTING FOR EFFICIENT DISAGGREGATE MANUFACTURING.** A new method is presented for using a subcontracting strategy to induce manufacturing efficiency by re-organizing the existing parts and machines into disaggregated cells. Two efficient algorithms are developed which identify the minimal number or minimal total cost of subcontractable parts while achieving disaggregation. The method has the flexibility of letting the designer control the number of cells and cell size thus generating a variety of cellular manufacturing system designs to choose from. (Author abstract) 13 refs.

**086004 VARIATIONS OF QUOTAS IN A PRODUCTION SYSTEM WITH FIXED PRICES.** Conditions for increasing the net system product are derived in the framework of an abstract production model. The use of these conditions essentially simplifies the proof and provides a generalization of some known results of Braverman's model with nonequilibrium prices. It is shown that in some cases the potential for increased output cannot be realized by small variations of quotas. Conditions are proposed when variation of output quotas of the system elements is free from this difficulty. (Author abstract) 10 refs.

**086005 EVENT-DRIVEN MODEL OF UNRELIABLE PRODUCTION LINES WITH STORAGE.** Using this algorithm a production line, with an arbitrary number of machines each processing items at different rates and with buffers by any size, can be modelled efficiently. The algorithm is based on computing the time to the next event for each buffer and machine, where the events are: a buffer becomes full, a buffer becomes empty, a machine fails, and a machine is repaired. By collapsing the production line to exclude empty buffers that stay empty and full buffers that stay full, piece-by-piece computation is avoided. Computation time is reduced further by updating a buffer only when the input or output rate of that buffer changes or when the state of that buffer changes. (Edited author abstract) 14 refs.

**086009 OPTIMAL CONTROL OF PRODUCTION AND MARKETING SYSTEMS WITH DISTRIBUTED TIME LAGS.** This paper deals with the problem of production and advertising policy for a decaying item whose gradual loss of potential or utility is associated with the passage of time, such as grain, photographic film or electronic components. The delay effects of the advertisement on the sales rate are also considered in the equations. The objective is to use optimal control theory to determine the production and advertising rates of the decay item which maximize the current value of net profit stream. For the model developed we present a computational procedure of finding the optimal policy and then carry out sensitivity analysis through an example problem. The properties of the optimal solution are discussed for the case of constant rate of delay effect. (Author abstract) 18 refs.

## Performance

**086011 REGENERATIVE PULL (KANBAN) PRODUCTION CONTROL POLICIES.** Two novel tractable and optimal regenerative pull ('Kanban') control policies are formulated: one policy minimizes the weighted starvation penalty, while the other maximizes the weighted throughput per unit time. Following these regenerative policies the production schedules are re-evaluated at each

decision epoch to mitigate the effects of processing time variability. Several important properties regarding the inherent interaction between the structure of the optimal policy, the performance of the system and the desired allocation of productive capabilities among the manufacturing resources are exemplified. **086013 EFFECTS OF MANUFACTURING PROGRESS FUNCTIONS ON MACHINE REQUIREMENTS AND AGGREGATE PLANNING PROBLEMS.** The existing models for machine requirements planning are based on the assumption of a constant production rate per machine throughout the planning horizon. This assumption is not valid in many production environments where the manufacturing productivity increases because of factors like: product and process redesign, more efficient maintenance and setup procedures, direct-labor learning, reduction of scrap losses, etc. This paper presents the effects of improving manufacturing productivity on machine requirements planning. An integral model which combines the aggregate production planning and machine requirements planning problems is discussed under the effects of manufacturing progress function. **086014 DISAGGREGATION UNDER UNCERTAINTY IN HIERARCHICAL PRODUCTION PLANNING.** This study deals with a hierarchical planning system that is used for planning of a single-stage manufacturing system. We consider two decision levels, aggregate and detailed planning, and formulate a model for evaluation of aggregate plans and optimal disaggregation in case of independent stochastic demand. It is shown how the optimal solution can be obtained with the aid of a dynamic programming algorithm. Furthermore, we give conditions that will guarantee optimality of a simple intuitive disaggregation rule. (Author abstract) 8 refs.

**086017 GAS SPRING ASSEMBLER RUNS BY 'YELLOW BOOK'.** The yellow book was a well-planned part of Gas Spring's rapid growth from a small, 18-person assembly operation in 15,000 square feet of leased space in 1983 into a new 100,000-square foot facility with more than 150 people in June 1985. The 'whole concept and environment' of modern material handling, just-in-time manufacturing, process management and process control in a basic, straight-line batch assembly operation were designed into the plant. But there was another important ingredient: people. The company was fortunate in getting excellent people who had good industrial experience. This helped in handling all the problems of getting started.

**086020 POTENTIAL BENEFITS OF JUST-IN-TIME PURCHASING FOR U.S. MANUFACTURING.** This article provides the results of a study done among U.S. firms to explore the potential benefits of just-in-time purchasing and the degree to which these benefits could be important to U.S. manufacturers. The results of the survey indicate that implementing JIT purchasing produces substantial benefits representing drastic economic improvements for companies that had formerly used traditional U.S. purchasing practices. In terms of intangible benefits from JIT, the survey confirms that the greatest degree of improvement appears in product quality, productivity, and success in encouraging suppliers to meet quality requirements. 15 refs.

Ansari, A. (Seattle Univ, Seattle, WA, USA); Modarress, Batoul. *Prod Invent Manage* v 28 n 2 Second Quarter 1987 p 30-36.

**086021 SHOP FLOOR CONTROL AND PRIORITY SCHEDULING.** The advent of just-in-time programs makes it necessary to look at the two subjects in the title of this article. For those companies which still have queue times much longer than actual work times, some resolution between operational back dating and critical ratio scheduling may be necessary. Where queue times are reduced so that the first pieces have moved downstream before the last pieces are completed, adjustments may be made for overlapping. Input-output control and master production scheduling are critical to planning and successful execution.

Putnam, Arnold O. (Rath & Strong Inc, Lexington, MA, USA). *Prod Invent Manage* v 28 n 2 Second Quarter 1987 p 50-58.

**086022 SINGLE MACHINE SEQUENCING TECHNIQUES WITH BOTH TARDINESS AND FLOW-TIME CRITERIA.** The performances of the best efficient sequence, contingent critical ratio (CCR), shortest processing time (SPT), earliest due date (EDD), and critical ratio sequences (CR) are compared. The processes are found to function in that order of success. Criteria considered here, the rule performs at least as well as SPT and EDD in the cases examined and was superior to EDD when due dates were narrowly distributed and superior to SPT when the due dates had a wide range. The implications are: (1) never use the conventional CR procedure, and (2) the best efficient sequences is better than any other rule. CCR performs robustly and better over a wide range of problems than do SPT or EDD. 16 refs.

Litteral, Lewis A. (Univ of Richmond, VA, USA). *Prod Invent Manage* v 28 n 2 Second Quarter 1987 p 59-64.

**086023 LINKING LEVEL REQUIREMENTS IN PRODUCTION PLANNING AND SCHEDULING.** Hierarchical planning and scheduling models force management to explicitly consider the links between different levels in an organization involved in the planning and scheduling process. This, alone, justifies their consideration as a planning tool. Additionally, this type of planning provides the flexibility necessary for realistically addressing actual problems. One is not restricted to a particular mathematical formulation or to particular assumptions, which in the past have limited the applications of planning and scheduling models. Their flexibility and usefulness is well demonstrated by the two applica-

tions. 8 refs.

**086024 PRE-JIT/TQC AUDIT: FIRST STEP OF THE JOURNEY.** Preparing for and taking a just-in-time (JIT) journey involves a complex set of activities whose progress needs to be monitored as it unfolds. Performing a pre-JIT/total quality control (TQC) audit with an interdisciplinary team provides a means to develop these baselines and to partially prepare the team to act as guides (and perhaps missionaries) for the journey. Both global and decomposed inventory turnover ratios and cycle times are easily understood measurement tools and are reasonably easy to develop. These measures, coupled with the others suggested in this article, can not only define the journey's starting point, but give some good hints for the most promising directions to take. 27 refs.

**086026 COMPARATIVE ANALYSIS OF THE COVERT JOB SEQUENCING RULE USING VARIOUS SHOP PERFORMANCE MEASURES.** The COVERT rule is examined in detail relative to its applicability, its sensitivity to various operating parameters and performance measures, and its performance compared to several other sequencing rules including truncated shortest processing time (SPT) rules, dynamic slack rules and modified due-date rules. The performance of COVERT is examined for a variety of tardiness measures. The examination is conducted within the context of a simulation model of a machine-constrained job shop with serial jobs and random routings. The results indicate that COVERT performs well as a sequencing rule and in most instances was superior to the other sequencing rules tested both directly and across varying degrees of due-date tightness. (Edited author abstract) 19 refs.

**086027 PRODUCTION BATCH SIZES IN A REPETITIVE FLEXIBLE ASSEMBLY SYSTEM.** The approach used in this study accounts for variations of part requirements, setup times, part costs, process times, and available capacity, and supports just-in-time (JIT) concepts. The joint production batch size procedure is illustrated using data from the taillight flexible assembly systems (FAS) center at the Ford fabrication plant in Sandusky, OH. Based upon monthly demand schedules, production batch sizes are estimated and scheduled. Since setup time and available uptime influence overall performance, we demonstrate how this approach assists in sensitivity analysis of the FAS's capabilities to support

manufacturing's mission of achieving low costs, low inventories, good equipment utilization, and minimum part shortages. 8 refs.

**086028 PLANNED LEADTIMES FOR SERIAL PRODUCTION SYSTEMS.** We investigate the problem of setting planned leadtimes in serial production systems when the actual leadtimes are stochastic. The objective is to minimize the sum of inventory holding costs, rescheduling costs arising from tardiness at intermediate stages of production, and tardiness of delivery to the customer. A single-pass algorithm is developed which finds optimal solutions. The analytical models underlying the algorithm and extensive computational experience indicate that it is never optimal to have planned leadtimes of zero when there are rescheduling costs at intermediate stages of production. This also implies that unconditional immediate dispatching is not optimal under these conditions. (Author abstract) 11 refs.

**086029 PRIORITY ASSIGNMENT PROCEDURES IN MULTI-LEVEL ASSEMBLY JOB SHOPS.** This paper explores the means by which the structural complexity of jobs can be incorporated explicitly into priority rules to reduce job lead times. The job lead time is viewed as consisting of two components: flow time and job staging delays. The primary focus of the paper is on the development of a class of priority rules that is aimed at reducing the staging delay. The class of priority rules that is developed is then used in combination with rules that are effective for the flow time component. The combined rule results in the improvement of the lead time performance. The paper also includes experimental results on sets of jobs of varying degrees of complexity. (Edited author abstract) 13 refs.

**086030 PERFORMANCE OF A MANUFACTURING CELL WITH INCREASED PRODUCT MIX.** We investigate the impact of increasing the number of items made in a cell on its performance. The optimal lot sizes of production and queuing delays are both shown to increase with increased product mix. However, these adverse effects diminish as more items are assigned to the cell. We also examine a strategy of sequencing which attempts to minimize the number of setups by looking ahead in the queue and processing all items for which the machine is already setup. In the case of similar items, it is found that this sequencing policy results in little savings in setup time. (Author abstract) 16 refs.

**086032 SINGLE FACILITY SCHEDULING WITH MULTIPLE JOB CLASSES.** This paper considers a

static single facility scheduling problem where jobs are divided into several mutually exclusive classes. The jobs in a given class need not be processed together. In addition to a known processing time for each job, there is a switching time involved which depends on the class of the job immediately preceding a job. A heuristic algorithm is proposed to find a minimum mean flow time schedule. The effectiveness of the proposed heuristic algorithm is empirically evaluated and found to indicate that the solutions obtained from this heuristic algorithm are often close to optimal. (Author abstract) 6 refs.

**086033 ALTERNATIVE APPROACHES TO SCHEDULE INSTABILITY: A COMPARATIVE ANALYSIS.** While there are many potential sources of schedule nervousness, we focus on two which appear to be most pervasive: the effect of forecast errors and the use of a rolling horizon. The alternatives examined are: freezing the schedules over the planning horizon; lot-for-lot ordering after the final product; buffer stocks; forecasting beyond the planning horizon; and, the change product; buffer stocks; forecasting beyond the planning horizon; and, the change cost produce. The effectiveness of these procedures was examined through a series of simulation experiments where the length of the planning horizon, the lot-sizing method, cost parameters, forecast error, and product structure were varied. (Edited author abstract) 14 refs.

**086034 HEURISTIC METHODS FOR FLEXIBLE FLOW LINE SCHEDULING.** Heuristic methods are presented for scheduling a flexible flow line. Two problems are considered: entry point sequencing, that is, deciding the order in which to present the jobs to the system, and dispatching, that is, deciding at each machine which job to start next. The results of these methods on test and realistic problems are described. The approach takes into account various line phenomena, such as setups, finite buffers, blocking and starvation, machine downtimes, and the current and subsequent states (at rescheduling intervals) of the line. Various optimization techniques are investigated including myopic and local search methods. (Edited author abstract) 15 refs.

**086037 PRODUCTION ACTIVITY CONTROL - A KEY ASPECT OF PRODUCTION CONTROL.** This paper reviews the role of Production Activity Control (PAC) in modern production and inventory management systems. It argues that the PAC system is fundamental to the realization of computer integrated manufacturing (CIM) at the operational or shop floor level. It presents an architecture for PAC and suggests that to date research has overemphasized one element of PAC, namely the scheduling function, and further has considered scheduling as an isolated problem without reference to the overall PAC system requirement. This, along with the tendency to consider scheduling as a combinatorial problem to be solved using mathematically elegant techniques accounts for the 'theory-practice gap' in scheduling. The paper concludes with some suggestions for further research effort in the PAC area. (Author abstract) 17 refs.

**086038 OPERATION SCHEDULING WITH GT AND PBC.** Generations of managers in industry and of academics in universities, have been intrigued by the problem of how to plan, and more recently how to automate the scheduling of the operations needed to make parts, on the machines and other work centres in a factory. The usual solution is: 'Tell the foreman to do the best he can'. This paper submits that the introduction of group technology (GT), coupled with period batch control (PBC), so simplifies the problem, that with minor analytical assistance the GT group foremen can do their own operation scheduling, more reliably and cheaply than it can be done by the computer. (Edited author abstract)

**086039 CYCLIC SCHEDULING FOR IMPROVEMENT.** Enormous improvements are possible by synchronizing manufacturing tasks sequentially within a short lead time and by creating cycle times by which many different kinds of work can be fitted together like clockwork. Actually achieving close synchronization requires utmost effort to improve every aspect of a manufacturing organization. A concept central to the improvement is the creation and use of cyclic schedules. The paper discusses how and why these relationships exist. (Author abstract)

**086040 MODELLING AND SCHEDULING A BATCH-TYPE PRODUCTION ON IDENTICAL MACHINES.** A new formulation and a near-optimal algorithm are presented for some variation of an NP-hard parallel scheduling problem with forest-type constraints and a  $C_{max}$  optimality criterion where multiple performing of each operation is required. The problem is formulated using a state space approach. In the algorithm the priority in which the assignment of operations to machines is made is based on the level of operation in the graph of precedence constraints. The worst-case performance bound of the algorithm is given, and the average performance is illustrated with computational examples. (Author abstract) 8 refs.

**086041 MASTER PRODUCTION SCHEDULING, CUSTOMER SERVICE AND MANUFACTURING FLEXIBILITY IN AN ASSEMBLE-TO-ORDER ENVIRONMENT.** This paper reports the results of a simulation experiment that compares alternative master production scheduling (MPS) procedures in an assemble-to-order environment. The results of the simulation experiment strongly support the use of the superbill techniques over the covering set technique. Moreover, of the experimental factors that influence delivery time

performance, the choice of master production scheduling technique has the largest effect. Demand variability has the next greatest effect on delivery time performance. The safety stock level has the third greatest effect and product commonality was fourth. (Edited author abstract) 4 refs.

King, Barry E. (Marquette Univ., Milwaukee, WI, USA); Benton, W.C. *Int J Prod Res* v 26 n 6 Jun 1988 p 1015-1036.

**086042 DYNAMIC KANBAN SYSTEM CASE STUDY.** This production control system was designed for a batch flow shop producing a woven product, but the same approach could be applied with very little modification to other multi-machine, multiproduct production cells with similar characteristics like plastics molding, metal pressing, die casting, bar stock turning, and extrusion. It has operated successfully for two years. This 'dynamic' kanban system differs from the standard kanban in accounting for seasonality of demand, the availability of forecasts, the fact that material identity cannot be maintained throughout the process, and the high variability of demand. This is a 'disassembly' process with independent demand. 7 refs.

Groenevelt, Harry (Univ of Rochester, Rochester, NY, USA); Karmarkar, Uday S. *Prod Invent Manage J* v 29 n 2 1988 p 46-51.

**086043 ESSENTIALS OF DELIVERY ANALYSIS.** In quantitative terms, delivery involves the design, approval, and purchase of equipment, tooling, and parts; plus the manufacturing, inspection, and shipping time periods - all evaluated against an agreed-upon date. This target date should be evaluated in two terms: deviation from target date, and delivery time. Delivery dates can be analyzed to compare different firms' delivery on similar items to evaluate each one as a potential supplier. The results of actual evaluations performed on three companies that make high-speed steel tooling are given. Control charts are shown for the individual delivery times expressed in terms of deviation from target date, and the moving ranges of delivery times. The control limits are calculated based on the average of moving ranges of successive points.

**086044 PARALLEL COMPUTING FOR PRODUCTION SCHEDULING.** Manufacturing operations managers daily face complex scheduling decisions when, in what quantities, and on what machines to manufacture a broad range of components, subassemblies, intermediate products and finished goods. To perform these tasks, managers need a true decision support system and the combination of mathematical modeling and parallel processing provides the key. By distributing submodels to multiple processors and integrating the results on other, concurrently running processors, a parallel approach can produce optimal answers in close to real time. Once implemented, the final schedules can produce significant cost savings.

## Theory

**086045 CONTROL OF MULTISTAGE, MULTIPRODUCTION FACILITY MANUFACTURING SYSTEMS USING PIECEWISE-CONSTANT CONTROL POLICIES.** A mathematical model is developed for a class of multistage manufacturing systems in which each manufacturing subsystem comprises one or several production facilities. It is shown that when the manufacturing subsystems are connected in cascade, singular perturbation methods can be used to synthesize fast-sampling error-actuated production control policies that ensure the closed-loop behavior of such manufacturing systems becomes increasingly noninteracting as the length of the sampling interval is reduced. The theory is illustrated by computer simulation studies showing typical transient and steady-state response characteristics of a

controlled manufacturing system consisting of three manufacturing subsystems. (Edited author abstract) 14 refs.

**086047 CONTROL IN THE OPT ENVIRONMENT.** Optimized Production Technology (OPT) is attracting attention from manufacturing organizations in the UK and USA. The OPT system considers production bottlenecks as the basis for scheduling and capacity planning. Flow is considered the driving force so that resources must be divided into bottleneck and non-bottleneck areas. Bottleneck resources are scheduled for maximum effect and non-bottlenecks are scheduled to serve these bottlenecks.

McManus, John J. (GE, USA). *Prod Eng (London)* v 66 n 7 Jul-Aug 1987 p 20-21.

**086048 CAPACITY ANALYSIS OF A MANUFACTURING CELL.** Traditional capacity analysis in manufacturing assumes that capacity is adequate if average utilization is under 100%. In practice, high utilization levels result in the formation of large queues, which in turn cause high production lead times and work-in-process inventories. Queuing models of manufacturing cells have been successfully used to analyze the relationships between utilization and queues. However, these models do not consider the impact of operational policy on the performance characteristics of the facility; this impact can be substantial. Here we describe the capacity analysis of a cell in which alternative overtime and shift policies, equipment choice and batching policy are considered. It is seen that in an integrated cell configuration, excess

equipment capacity may be economically preferable to multiple shifts. (Author abstract) 20 refs.

**086050 FORECAST HORIZONS FOR THE DISCOUNTED DYNAMIC LOT-SIZE PROBLEM ALLOWING SPECULATIVE MOTIVE.** This article considers the dynamic lot-size problem under discounting, allowing speculative motive for holding inventory. A variable rolling-horizon procedure is presented, which, under certain regularity conditions, is guaranteed to generate an infinite-horizon optimal-production plan. We also discuss a fixed rolling-horizon procedure which provides a production plan that achieves an infinite-horizon cost within a user-specified tolerance  $\epsilon$  of optimality. The fixed-horizon length  $T_\epsilon$  needed in this procedure is given in terms of a closed-form formula that is independent of specific forecasted demands. We also present computational results for problems with a range of cost parameters and demand characteristics. (Author abstract) 15 refs.

**086051 LOT SIZING IN A PRACTICAL MANUFACTURING SYSTEM.** The determination of lot sizes is important to the effective operation of a manufacturing system. Previous approaches for determining lot sizes usually have some major problems associated with their use in a practical manufacturing system. This paper presents a methodology for setting lot sizes in a practical manufacturing system that is both simple and powerful in operation. This methodology is based on dividing the products into product families with each family having a lot size factor associated with it. The lot size factors can be tested by simulating the manufacturing system and a particular set of lot size factors chosen on the basis of good overall system performance. The author presents a reduction method allowing one to calculate the stationary flow of a serial system consisting of  $n$  working elements with stores placed between them. The working element flows may be different one from the other. The method is suited to localization and dimensioning of intermediate stores and can be applied both in the design stage and in calculating the possible increase of flow in existing systems. (Author abstract) In German. 16 refs.

Petigk, J. *MSR Mes Steuern Regeln* v 30 n 9 Sep 1987 p 402-405.

**086058 SIMULTANEOUS ENGINEERING.** Pioneers of the automobile industry practiced what is now called simultaneous engineering. They did not limit themselves simply to designing products; they were product and process engineers who designed both cars and the factories that built them. In fact, many of the early inventors in other American industries were also craftsmen, who knew how to build the products they invented. The paper emphasizes the importance of designing the process at the same time that a product is designed. To achieve this design for a manufacturability system called simultaneous engineering the companies may have to make a special effort to knock down departmental barriers, real or imagined, that have developed over the years.

**086064 ACCUMULATING CONVEYORS AID ASSEMBLY OF KENWOOD'S PRODUCT MIX.** A production line based on the use of accumulating pallet conveyors has enabled Kenwood Ltd to bring about a number of improvements in the assembly of some of its food processors. The improvements will initially become evident in increased quality and productivity. While the majority of the assembly operations are manual at present, the design of the conveyor system also provides opportunities for the gradual introduction of automated assembly where this is appropriate.

Anon. *Prod Eng (London)* v 67 n 3 Mar 1988 p 40-41.

**086065 INCREASING PARTS FEEDER PRODUCTIVITY.** The article covers feeder basics, performance evaluations, component adjustments, and related topics. Feeder manufacturers are becoming increasingly aware that the majority of small-parts feeding devices currently in service are operating below par. Instead of taking feeders out of service for repairs and adjustments that could greatly improve productivity and longevity, many companies are merely purchasing new feeders. This may be one way of improving productivity; however, there are several other less costly methods that can make substantial improvements in present equipment.

Ruhl, Ronald J. (Automation Devices Inc, Fairview, PA, USA). *Automation (Cleveland)* v 35 n 4 Apr 1988 p 18-20.

**086066 STATISTICS OF HIGH-YIELD MANUFACTURING PROCESSES.** This paper reviews the basis and application of the '6 8' process design criterion in the context of the process capability index for high-yield production operations. The approach assumes that product features can be described by a Gaussian (normal) distribution function. When the number of components and subordinate processes is large, and if the process mean varies from its intended centered position, the work of each process element must be accomplished at very low defect rates for acceptable yields of finished products. The 6 8 criterion establishes a 3.4 parts per million (ppm) defect rate as a target value for each process element. A quality budget procedure is suggested as an effective means for planning and managing defect rates of each process element and for indicating where efforts can best

be placed for continuing process improvements. Finally, the paper recommends, a design space based on the shifted process capability index. (Author abstract) 3 refs.

**086067 COMPLEXITY, RELIABILITY, AND DESIGN: MANUFACTURING IMPLICATIONS.** This paper presents some interesting and new ideas about the nature of the forces driving the worldwide trend toward flexible automation. It suggests, in brief, that the demand for computer-integrated manufacturing (CIM) arises from what Nathan Rosenberg has termed a 'mismatch,' that is, a problem that was created, in effect, by technological progress itself. In this case the 'problem' is that defects in manufacturing have become intolerable. The paper explores four related hypotheses, as follows: That the human 'error rate' is inherently large and cannot be reduced to (or nearly to) zero even under the most favorable conditions. That 'high performance' in a product tends to require a high degree of precision and complexity in the design and manufacturing process. This tendency can be seen most clearly over time. That defects can be thought of as lost information (just as errors in accounts or messages) and that error-detection and error-correction techniques from communications theory may be appropriate tools for management. That defects can best be eliminated in manufacturing by adopting the 'monolithic' concept that has been so successful in electronics. (Edited author abstract) 27 refs.

Ayres, Robert U. (Carnegie-Mellon Univ, Pittsburgh, PA, USA). *Manuf Rev* v 1 n 1 Mar 1988 p 26-35.

**086068 STUDY ON PRODUCTION LOT-SIZING IN MRP SYSTEM (1ST REPORT, SINGLE-ITEM, UNCAPACITATED LOT-SIZING).** This paper considers a single-item, uncapacitated lot-sizing problem in MRP system, and new heuristic approaches, called Forward-Forward (FF) method and Forward-Backward (FB) method are proposed. These methods are based on Silver-Meal (SM) method. For the initial production plan obtained by SM method, a cost minimum procedure for successive two lot-sizing periods is repeated forward from the first period or backward from the last period, which results the decrease of total cost for whole planning horizon. And to evaluate the performance of FF and FB methods, four heuristic approaches (FF, FB, SM, Part-Period-Balancing) are compared in fixed horizon and rolling horizon environments. By testing each method for various coefficients of cost (set-up, holding) and demand variance, the cost deviation from the minimum cost by Wagner-Whitin (WW) method is analyzed. The result has shown that FF, FB methods may outperform the other heuristics and even WW method for rolling horizon. (Author abstract) 4 refs. In Japanese.

**086078 PRODUCTION-ECONOMIC ASPECTS ON SETUP EFFICIENCY.** In recent years, the reduction of set-up times has been given increasing attention as a fundamental prerequisite for efficient and flexible production. In this paper, some theoretical and practical production-economic aspects on set-up efficiency are presented. The relationship between set-up efficiency and lot sizing is investigated for different planning situations and production systems. Furthermore, practical aspects on these relationships are discussed based on set-up efficiency practice in six Japanese companies, as well as on case studies from two Swedish manufacturing firms. 10 refs.

**086079 JUST-IN-TIME FROM A BUSINESS LOGISTICS PERSPECTIVE.** Just-In-Time (JIT) administration based on the Japanese model is being used by an increasing number of companies in Scandinavia. The objective is to eliminate unnecessary stock and increase the quality standard for both manufacturing and assembly processes. In a present research project at Linkoping Institute of Technology, Sweden, Just-In-Time is treated from a business logistics perspective with emphasis on effects for the external transportations. The main objective is to identify the changed demands, from the transport point of view. The results of the study show that every specific transport arrangement is studied thoroughly by the transport buying company. Adjustment is then made

to the total transport flow in the appropriate zone. The clearest effect on the transporters is a more difficult time control. (Edited author abstract) 1 ref.

**086080 INFORMATION SYSTEMS FOR ASSEMBLY-TO-ORDER PRODUCTION: AN APPLICATION.** In many production systems, the procurement of materials from suppliers has to be determined long before actual customer orders are available. In such systems, the material orders are generated either from forecasts or from a master production schedule. Actual customer orders should be evaluated with respect to the time-phased availability of the components to be assembled. This paper describes a number of requirements and solutions with respect to information systems in order to support this control structure. Special attention is given to the bill-of-material module. (Author abstract) 9 refs.

**086082 SAFETY AND RELIABILITY SOCIETY SYMPOSIUM 1985: ACHIEVEMENT OF RELIABILITY IN OPERATING PLANT.** This conference proceedings contains 6 papers discussing the activities of various companies in the field of Reliability and Safety Engineering. The papers present probabilistic quantifications of reliability and employ statistical procedures for their manipulation. The statistical approach to design is discussed in one presentation. Developments in the process plant area covering aspects of instrumentation, microprocessor control and human factors technology are also presented. A comparison of approaches is provided for the estimation of production from a sub-sea cluster of wells in a hostile environment and in another paper, reliability analysis is used to compare protection systems for pipelines. Technical and professional papers from this conference are indexed and abstracted with the conference code no. 10650 in the Ei Engineering Meetings (TM) database produced by Engineering Information, Inc.

#### Analysis

**086085 SNAPSHOT OF THE PROFILE OF A QUALITY CIRCLE PROGRAMME AT THE EIGHTEENTH MONTH STAGE.** The paper outlines the findings of a case study carried out in a printed-circuit board manufacturer, as part of a development project on quality circles. At the time of study, the circle program had been operational for around 18 months, which is recognised as a critical phase for circles. The strengths and weaknesses of the circle program are discussed. Among the main findings are that circles were introduced to develop the communication and problem solving skills of employees; these objectives have been achieved, however, the trivial nature of many circle projects has caused some circle members, nonmembers and managers to question the benefits. Most of the circles are facing problems due to the movement of people between departments, and the company has adopted a 'classical' circle concept and is pursuing it in an almost evangelical fashion which is strangling the development of some circles. **086086 SURVEY OF QUEUEING NETWORK PACKAGES FOR THE ANALYSIS OF MANUFACTURING SYSTEMS.** Successful design and installation of a complex manufacturing system can depend on the proper utilization of a mathematical model during the initial design and planning phases. Because the number of decision variables and potential configurations are large, analysis typically requires a computational tool. This paper surveys the most widely used queueing network packages for practical manufacturing system design. Contrasts are drawn among the particular underlying mathematical models and their corresponding assump-

tions and network properties, and the computational environment for the implementation of these tools is described. (Author abstract) 49 refs.

**086087 CAPACITY ANALYSIS OF TWO-STAGE PRODUCTION LINES WITH MANY PRODUCTS.** We consider two-stage production lines with an intermediate buffer. A buffer is needed when fluctuations occur. For single-product production lines fluctuations in capacity availability may be caused by random processing times, failures and random repair times. For multi-product production lines fluctuations are also caused by different processing time ratios for different products and by set up times. We examine whether it is possible to use the results developed for single-product flow lines, where the production units have exponentially distributed life- and repair times, for the multi-product case. As an example the case of a consumer electronics factory is studied. (Author abstract) 8 refs.

**Assembly** See Also ELECTRONIC EQUIPMENT MANUFACTURE—Assembly; SOLDERING; TOOLS, HAND.

**086088 WHAT'S TOMORROW'S MOST CRITICAL ASSEMBLY TECHNOLOGY?** Information, not automation, is where most gains promised by new technology can be found. Information associated with assembly can be split into physical processing (including robotics, AGVs, etc.) and information processing. An assembly operation can be broken further into a series of tasks that must be completed to assemble a product. Each task then can be reduced to the physical actions necessary and the associated information. What has yet to be perfected are the ways to process sensor information and feed it back to the physical processors. Current systems are incapable of translating deviations into the proper physical actions needed to assemble a part. Addressing this shortcoming will produce many of assembly's future advancements.

Coleman, John R. (Assembly Engineering, Wheaton, IL, USA). *Assem Eng* v 31 n 1 Jan 1988 p 22-25.

**086089 ASSEMBLY HALL OF FAME.** Through most of history assembly technology has been primitive at best. Products were made of individually produced and assembled components, hand fitted, even when a quantity was desired. The concept of mass production of interchangeable parts is a comparatively recent one. This article presents a historical review of assembly in manufacturing operations from the mid-18th century to the present. Subjects covered include work design, automation, adhesives, electronics assembly, and others.

Schwartz, Walter H. (Assembly Engineering, Wheaton, IL, USA). *Assem Eng* v 31 n 1 Jan 1988 p 30-32.

**086090 EVOLUTION OF AUTOMATIC ASSEMBLY.** The 30 years of Assembly Engineering have seen rapid evolution in automatic assembly. New technologies have matured providing tools for an even broader range of application possibilities. The most significant include robots, programmable controllers, ultrasonic welding, orbital riveting, lasers, and machine-vision systems. Development and implementation of these tools have been advanced or retarded by economic conditions and management's perceptions at the time. The article presents a historical review of the title subject in terms of assembly machinery, military ordnance requirements, computer integrated manufacturing, machine vision, and others.

Riley, Frank J. (Bodine Corp). *Assem Eng* v 31 n 1 Jan 1988 p 36-38.

**086091 LASERS LIGHT UP ASSEMBLY.** Laser welding is rapidly replacing many conventional welding and fastening processes. The benefits vis-a-vis conventional welding and fastening techniques include: no contact with the workpiece, no pressure applied on material, no thermal distortion, and no electrode wear; the beam produces uniform weld penetration, resulting in excellent weld integrity; minimum heat affected zone (HAZ), microcracking and melting, and others. Because of these advantages, laser welding is increasingly the process of choice for fabricating precision electronic components and assemblies, medical implant devices, diaphragms, bellows, pressure sensors, and auto components. High melting point materials such as tungsten, molybdenum, zirconium, and tantalum were welded with good results by using cover gases. High reflectivity materials (95% for Nd:Yag) such as gold and silver also can be welded. These and other aspects of the subject are discussed, along with laser soldering.

Coleman, John R. (Assembly Engineering, Wheaton, IL, USA). *Assem Eng* v 31 n 3 Mar 1988 p 33-34.

**086092 TORQUING TUTORIAL.** Demand for better product quality is leading to widespread application of torque transducers and instrumentation for monitoring and controlling fastener installation. Such systems precisely control fastener torque. They also record performance and quality trends, thus providing a basis for statistically controlling assembly. This article discusses strain gage-based torque transducers. Subjects covered include type and operation of the transducers, instrument readings, torque monitoring applications, angle monitoring applications, and others.

Munn, Harold (GSE Inc, Farmington Hills, MI, USA). *Assem Eng* v 31 n 3 Mar 1988 p 38-41.

**086093 ASSEMBLY WORKTRACKING.** Some of the technologies in use are optical character recognition, bar coding, magnetic strip, touch screen, radio frequency identification and radio frequency data communication. Most of these are simply identification systems and of these bar coding is by far most common and by now familiar. Radio Frequency (RF) systems recently have been developed to a point where intriguing data transfer applications are possible. Work tracking, while itself computer based, is not necessarily part of an automated assembly system. As valuable as the information collected in a manual operation is, bar codes or other automatic identification and data collection techniques come into their own only on the automated assembly line. RF identification systems comprise a miniature transmitter/receiver, a transceiver or transponder with memory (usually mobile) and a sensor or reader unit that is stationary or perhaps portable. These and other aspects of the subject are discussed.

Schwartz, Walter H. (Assembly Engineering, Wheaton, IL, USA). *Assem Eng* v 31 n 4 Apr 1988 p 32-34.

**086094 MECHANICAL ASSEMBLY: MACHINES, SYSTEMS, CONTROLS & ACCESSORIES.** During the early '80s, the words assembly system replaced assembly machine. Systems usually have more inspection and functional testing stations, and include data highway capability. They also have greater flexibility for future model changes. But, with these exceptions, there is little difference in the mechanisms of various assembly processes. This article presents the opinions of various manufacturers on assembly machines and systems, assembly automation, quality control, and other aspects of the subject.

Coleman, John R. (Assembly Engineering, Wheaton, IL, USA). *Assem Eng* v 31 n 9 Sep 1988 p 22,26-28.

**086095 ADHESIVES, SEALANTS, PASTES & DISPENSERS.** Adhesive vendors focusing on products that lower labor content, facilitate speed of assembly, increase ease of process automation, improve assembly/component quality, and meet specific user requirements. They will provide more assistance to facilitate a manufacturer's adhesive selection and process development procedures.

The article discusses new materials, automation, preapplication, the effect of just-in-time production on automated dispensing, and other aspects of the subject.

**086097 ANALYSIS OF A LOOP FLOW TYPE OF AUTOMATED MANUFACTURING SYSTEM.** This paper deals with an automated manufacturing system which consists of same machines located along a loop type of conveyor with a loading-unloading station. The system is described by a Markov chain model and the production rate is analytically derived. The relation between the production rate and the arrival rate of parts and the average processing time of the machines is studied by the numerical results. Furthermore, the optimal control problem of dispatch of parts into the system is formulated as a Markov decision process. The properties of optimal control are considered and the production rate under the optimal control is compared with that under noncontrol. (Author abstract) In Japanese. 10 refs.

**086098 AUTOMATING THE MANUFACTURE OF ONE-OFFS WITH MOULD MAKING AS AN EXAMPLE.** Any future automation of one-off manufacture - one-offs being a characteristic of mold making - is not to be expected in the area of machine components. There is indeed a considerable reluctance to employ automated machines and flexible manufacturing systems on a broader front than hitherto. On the other hand, development and utilization of information technology as components in the manufacturing sequence are likely to advance apace. Quite apart from the improved performance of electronic control systems, computer aided design (CAD) and manufacturing (CAM) are likely to achieve more widespread and rapid acceptance, in particular by way of linking different technologies. (Author abstract) 4 refs.

**086103 TURING MACHINES AND GUTENBERG TECHNOLOGIES: THE POSTINDUSTRIAL MARRIAGE.** This paper examines the managerial and economic implications of the new forms of automation based on microprocessor control, for use in piece part manufacturing. The important technological characteristics of the new forms of automation are identified, and compared with those of the premicroprocessor era. The new technologies combine the characteristics of Gutenberg technologies and Turing machines, and provide the potential for a high level of versatility and the ability to integrate information fully with material processing. This is in marked contrast to the previous technologies which resulted in systems with fixed production sequences, where information was manually processed, and which were predominantly used for long production runs and low product variety. (Edited author abstract) 29 refs.

Shirley, Gordon V. (Univ of California, Los Angeles, CA, USA); Jaikumar, Ramchandran. *Manuf Rev* v 1 n 1 Mar 1988 p 36-43.

**086104 INTELLIGENT INSTRUMENT: ITS ROLE IN FACTORY AUTOMATION.** The technologies associated with manufacturing have undergone several changes in the past decades; the primary business objective forcing these changes has been the need to increase profitability by improving products and raising productivity. Current management thinking, in order to achieve these objectives, centres on the concept of an automated factory incorporating computer integrated manufacture (CIM), which brings together the design, production, marketing, commercial and financial functions. It is

argued that cost-effective implementation of CIM systems depends crucially on the effectiveness of sensors and instruments acquiring plant-level data.

Bhattacharya, S. (BICC Research & Engineering Ltd, London, Engl). *IEE Rev* v 34 m 5 May 12 1988 p 203-206.

**086105 MOVING SMALL PARTS AND ELECTRONICS—SYSTEMS AND SUPPLIERS.** Automated storage and retrieval systems, conveyors and automated guided vehicles make up the 'skeleton' that can move products and components from fabricating to shipping. It is argued that selecting the right systems and suppliers is crucial to success in the move toward automation. (Edited author abstract)

Buiten, Roger (Jervis B. Webb Co, Ann Arbor, MI, USA). *Manuf Syst* v 6 n 5 May 1988 p 18-23.

**086106 CONCEPT ENGINEERING: FACTORY AUTOMATION'S MISSING FRONT END.** Factory automation or computer-integrated manufacturing (CIM) can help strengthen America's competitive position. By automating the production and manufacturing of products, CIM allows products to be taken to market faster and more efficiently. Yet, if CIM is to live up to its full potential, it must focus not only on product manufacturing but also on the design and quality of these products. This is the missing front end of CIM. Some appropriate guidelines are outlined. It is pointed out that with the advent of powerful desktop computers and sophisticated software, mechanical engineers can reduce development times by using such systems for concept design and testing.

Miller, Richard (Aries Technology Inc, Lowell, MA, USA). *Manuf Syst* v 6 n 5 May 1988 p 44-46.

**086107 PRINCIPLES FOR PART SETUP AND WORKHOLDING IN AUTOMATED MANUFACTURING.** The future automation of small batch manufacturing will depend on part fixturing. Fixturing involves the workholding components and the associated planning that must be done to properly position and finally clamp a part. In the past, part setup and clamping problems have been dealt with as a craft: human expert machinists, after an accumulation of many years of experience, derive part process planning strategies in a reasonable amount of time. This paper describes work that aims to create a science base for clamping: distinct patterns have been discovered that characterize how expert machinists plan setups and clamp parts. A core set of tradeoffs employed by the experts to clamp and machine parts has been established, and these tradeoffs are parameterized by models based on first principles of mechanical engineering and experimental results. Knowledge based planning methods of template matching, feature interaction guide selection, and attribute value approximation have been identified. (Edited author abstract). 20 Refs.

**Computer Aided Design** See Also ENGINEERING EDUCATION; PAPER AND PULP INDUSTRY—Computer Simulation; PRODUCTION CONTROL—Management.

**086109 TECHNIQUES FOR DESIGNING PRODUCTION SYSTEMS.** While individual production technologies are developing rapidly to meet modern manufacturing objectives, emphasis now needs to be directed towards finding ways of maximising their effectiveness when the various components are combined into systems. In supporting the optimal designs of complex systems like FMS, new tools are required that not only follow a systems approach but also attempt to prescribe a system design. This paper provides some background to FMS design, briefly reviews several supporting design techniques, and highlights the need for new tools that will lead to more effective systems. (Author abstract) 4 refs.

Dooner, Mike (Open Univ, Engl). *Comput Aided Eng J* v 4 n 4 Aug 1987 p 157-159.

**086110 COMPUTATIONAL TASKS IN ROBOTICS AND FACTORY AUTOMATION.** The design of Manufacturing Planning and Control Systems (MPCSs) that negotiate with customers and suppliers to exchange products in return for money in order to generate profit is discussed. The computational tasks of MPCS components are specified as a starting point for the development of computational engines, such as computer systems and programs, that execute the specified computation. Key issues are the overwhelming complexity and frequently changing application of MPCSs. (Edited author abstract). 57 Refs.

**086111 ATTITUDES TO THE USE OF COMPUTERISED INFORMATION SYSTEMS FOR PRODUCTION MANAGEMENT IN MANUFACTURING INDUSTRY: A SURVEY.** The application of computers in production management is receiving considerable attention as is that it can help the production manager make complex decisions about sequencing and timing production activities to satisfy competing priorities. This report consists of the presentation of findings gleaned from a survey of 107 companies in manufacturing, together with case studies of two companies who have recently ventured into the application of 'computerized information systems for production management' (CISPMs). The overall aim of the survey was to obtain as objective an assessment as possible of the level of CISPM applications in UK manufacturing and the attitudes of production managers to their use. The body of the report is in three parts. Firstly, an account is given of the principal findings from the main survey of 63 companies. This is subdivided into three sections, namely: an analysis of the results by company and by site; an analysis by site and by type of computer system; an assessment of overall adequacy by type of computer system. This constitutes the core of the report. Secondly, two case studies of companies' experiences of operating a CISPM are presented, based on the detailed follow-up interviews conducted with them. Finally, the report is concluded with a statement of the general findings from the main survey and the case studies. (Edited author abstract) 16 refs.

**086112 LEARNING FROM THE SYSTEMS HOUSES.** Talking to systems and engineering houses can be quite an education. These systems houses have been faced with bringing in the whole spectrum of programmable monitoring and control equipment, from intelligent instrumentation and PLCs, through graphics systems and on to computer-based systems, some of which have superseded their earlier output, while others have served to augment it. This in turn has meant undertaking overall system design, and a massive investment in software at all levels, as well as a substantial burden both in terms of acquiring appropriate development and documentation systems and in assessing the various manufacturers' hardware prior to promoting its implementation. Pertinent experience is reported.

Tinham, Brian. *Control Instrum* v 19 n 10 Oct 1987 p 57, 59, 61.

**086113 PRODUCT INFORMATION DATABASES.** Product information is one of the primary needs of architects and engineers. Microfilm-based products have been around for some time to record pictures, drawings, and text of product catalogs. Only recently, however, has optical disk technology allowed vast quantities of graphic and text data to be stored on small disks, distributed at a reasonable cost, and then searched with microcomputer-based equipment. This technology, along with existing computer systems and database, will revolutionize how architects and engineers practice their professions. 5 refs.

Ballast, David Kent. *Constr Specifier* v 40 n 8 Aug 1987 p 44-47, 49-50.

**086114 BEYOND MRP II.** Many companies have been using materials requirements planning systems (MRP) or manufacturing resource planning systems (MRP II) for over two decades. In this time there has been little enhancement other than the adoption of on-line data processing which has speeded up the flow of information. In this article the author introduces a strategy for the development of finite scheduling systems to create computer-based intelligent systems.

Burgoine, John. *Prod Eng (London)* v 67 n 1 Jan 1988 p 31-33.

**086115 HOW DO WE OPTIMISE PRODUCTION ON THIS SITE?** Planning is the allocation of resources (process plant, materials, labor, etc) to meet a given production requirement. Scheduling is the organization over time of these resource allocations. In practice, planning and scheduling are usually performed as one integrated activity. A PC-based expert system is being developed to advise process plant managers how they might use their production resources to best effect.

Taylor, Clive. *Process Eng (London)* v 68 n 9 Sep 1987 p 35, 37.

**086116 SOFTWARE ARCHITECTURE OF INTEGRATED COMPUTER AIDED DESIGN AND MANUFACTURING SYSTEMS.** Fujitsu has developed an open architecture CAD/CAM system called Integrated Computer Aided Design and manufacturing system (ICAD). In addition to having several broadly applicable easy-to-use functions, ICAD can be used instantly after installation, and can be customized to meet each user's specific requirements. ICAD can also be integrated with other systems in order to extend the scope of applications for automatic design and manufacturing. This paper discusses the basis structure of ICAD, with particular attention being given to its open architecture. Also discussed are problems of system implementation and the method used to achieve such. This paper evaluates ICAD's use in the field, and provides commentaries on future plans. **086117 COMMUNICATIONS PROCESSOR FACILITATES OPERATOR-PROCESS COMMUNICATION AND PROCESS VISUALIZATION.** Production processes require human supervision and intervention, thus making the quality of the tools available for operator-process communication and process visualization essential for the quality of an automation system. The scope of the operator-process communication and process visualization facilities in the SIMATIC S5 automation system has now been extended to include the new configuration level 2 of the CP526 communications processor, thus providing capabilities for additional important graphic renditions of process variables. (Edited author abstract) 2 refs.

**086118 TOOL FOR CONSTRUCTING PRODUCTION SYSTEMS ON THE DEDUCTIVE DATABASE SYSTEM ADBIS.** The authors have designed and implemented a tool for constructing production systems on the deductive database system Adbis that is a relational database management system with inference functions based on Horn set refutation procedures. Characteristics of the production systems developed by using this tool users can handle large factual data as well as production rules since they are linked with a relational database through the Horn set refuter; users are able to easily perform a backward reasoning because the left-hand side and right-hand side of production rules rules are syntactically symmetrical; inference functions based on Horn set refutation procedures can be used for checking the applicability of production rules to data accessed by the production rules, and for expressing and checking the integrity constraints which the data satisfies; the performance of the production systems are expected to be improved by using the results of much research in Horn set refuters and Prolog. (Edited author abstract) 20 refs.

**086119 OPERATOR/COMPUTER INTERFACE: ENSURING A GOOD WORKING RELATIONSHIP.** In recent years, the trend in machine control has been away from custom-built dedicated logic circuits to flexible programmable systems. With the introduction of the microprocessor came the ability to produce small, compact, relatively cheap computers, greatly increasing the range of projects to which they could be applied. It is pointed out that without the support and understanding of operators and engineers, the full benefits to be gained from investing in computer-controlled equipment may never be realised.

Bradford, Mike (Lucas Engineering & Systems Ltd, UK). *IEE Rev* v 34 n 4 Apr 21 1988 p 161-164.

**086120 UTILIZATION OF MICROCOMPUTERS IN PRODUCTION AND INVENTORY CONTROL.** The aim of this paper is to describe the use of microcomputers in production and inventory control from several points of view. However, it is not intended to be a complete survey of the field. The main reasons for the increased interest in microcomputers are the development of microelectronics and the modern manufacturing philosophy. Microcomputers may be utilized as single units, as networks of micros or as a part of the whole computer system including a main frame. The available technology is reviewed according to typology of microcomputers, data transmission and programming tools. Finally, examples of available software are represented. (Author abstract)

## Computer Integrated Manufacturing

**086122 DYNAMIC SCHEDULING IN CELLULAR MANUFACTURING SYSTEMS: A FRAMEWORK FOR NETWORKED DECISION MAKING.** This paper describes a dynamic scheduling method for cellular manufacturing systems. Essentially an artificial intelligence based approach for the networking environment, the method is adaptive to the changes in the manufacturing environment and can take into account such information as loading factor, unexpected breakdowns, and new job arrivals. The major features of the method are a distributed task assignment mechanism executed through the communication network for intercell scheduling and a knowledge based system for cell level scheduling. A main advantage of such a method is that the scheduling on both levels can be dynamically executed in real time. (Author abstract). 25 Refs.

Shaw, Michael J. (Univ of Illinois at Urbana-Champaign, Champaign, IL, USA). *J Manuf Syst* v 7 n 2 1988 p 83-94.

**086123 CIM, DATA AND STANDARDIZATION WITHIN THE NBS AMRF.** Computer-Integrated Manufacturing (CIM) is key to the factory of the future, shared data is key to integration, and interface standards are key to data-sharing. Within its Automated Manufacturing Research Facility (AMRF), the U.S. National Bureau of Standards is addressing issues of standardized interfaces in the four principal data activities of the automated factory: data preparation, data administration, data communication, and data-driven control. By means of such interface standards, the flexibly automated, robotics-based, computer-integrated factory of the future can be realized in a modular, easily integratable, multi-vendor form. (Author abstract). 19 Refs.

Swyt, Dennis A. (NBS, Gaithersburg, MD, USA). *Robotics* v 4 n 2 Jun 1988 p 193-199.

## Computer Simulation See Also COMPUTER SIMULATION.

**086124 ON-LINE SIMULATION OPTIMIZES FLEXIBLE MANUFACTURING SYSTEMS.** Smaller batch sizes, shorter product life and the need to react more quickly to changing markets call for more use of flexible manufacturing systems. It is pointed out how optimization of these systems is achieved by simulation. (Edited author abstract) 2 refs.

Neupert, Heinrich (Siemens AG, Erlangen, West Ger). *Energy Autom* v 9 n 2 Mar-Apr 1987 p 18-20.

**086125 REDUCE MANUFACTURING RISK WITH SIMULATION.** Simulation is an analytical technique that allows complex manufacturing or material handling systems to be evaluated numerically over a period of time with the help of a computer. This analytical technique has been around for some time but has only recently met with acceptance in manufacturing. In addition to offering visual capability, some new simulation systems allow design parameters of a working concept to be changed and models built without writing any simulation code. Simulation significantly reduces the technical risk of implementing production changes by allowing the effects upon a system to be seen and by providing performance measures such as work-in-process, percent utilization, and throughput. This article discusses simulation basics and other

aspects of the subject.

Vester, John (Litton Industrial Automation Systems); Muller, Dan. *Automation (Cleveland)* v 34 n 11 Nov 1987 p 42-44.

**086126 SELECTION OF A MANUFACTURING SIMULATION TOOL.** Over the past five years, the options available for individuals attempting to select a simulation tool have risen. This discussion describes one approach to categorising and selecting simulation software tools. It follows eighteen months of research into the requirements of production engineers involved in process design within a large electronics factory in the UK.

Chrystall, C.N. (Portsmouth Polytechnic, Engl). *Prod Eng (London)* v 66 n 11 Dec 1987 p 24-28.

**086127 EQUIPMENT MODEL UNIFICATION FOR CONTROL AND EFFICIENT PLANNING OF SINGLE-SCALE PRODUCTION.** The use of simulation for designing, technological preparation and organization of FAP is discussed. Algorithm for efficient planning for FAP is suggested. The scheme of utilization of unified machining FAP technological equipment models is given. (Author abstract) 3 refs. In Russian.

**Costs** See Also AIRCRAFT, MILITARY—Airframes; COMPUTER AIDED MANUFACTURING; ECONOMICS—Mathematical Models.

**086132 TECHNIQUES FOR COST ESTIMATING IN EARLY PROGRAM PHASES.** This paper describes the process of eliciting cost estimates and modifying cost assumptions which enable cost prediction of not well defined systems. It describes what kinds of cost models are acceptable and usable and how the data may be efficiently obtained. The choice of the right experts (generalists, people with perception), the proper interviewing techniques (written versus oral, delphi, argumentative, etc.), the important role of the interviewer or moderator (reinforcing behavior versus objective criticism), and the transformation of question responses into cost model inputs are discussed. The paper reveals the thought process and includes several examples of actually performed, early concept phase cost estimates and contains a list of several do's and don'ts the author experienced in arriving at these early cost predictions. (Edited author abstract) 10 Refs.

Meisl, Claus (Rockwell Int, Canoga Park, CA, USA). *Eng Costs Prod Econ* v 14 n 2 Jul 1988 p 95-106.

## Database Systems

**086133 SYSTEMS APPROACH TO PLANT MONITORING.** A systematic approach to the collection and evaluation of data is required to ensure that timely, reliable and concise information is available upon which plant management decisions can be made. The data must be analysed to yield parameters which define the state of the object being monitored. The most striking characteristic of diagnostic monitoring within discrete parts manufacturing as opposed to continuous process plant is that the machinery is changing its operating state second by second. Speeds, feeds, tools, workpiece material and geometry are all variables. Any monitoring system must be able to cope with this non-stationary environment. The DAAS therefore incorporates facilities to enable it to communicate with the CNC or PLC on the machine and follow the execution of the part program line by line making it aware of the machine's operating conditions. Data acquisition and analysis are synchronised accordingly to provide real time status information.

Ephraim, Piet. *Prod Eng (London)* v 67 n 4 Apr 1988 p 50-52.

**Design** See PRODUCT DESIGN; QUALITY CONTROL—Management.

## Design Aids

**086134 DESIGN FOR MANUFACTURE.** Design for manufacture (DFM) represents a new awareness of the importance of design as the first manufacturing step. It recognizes that a company cannot meet quality and cost objectives with isolated design and manufacturing engineering operations. To be competitive in today's marketplace requires a single engineering effort from concept to production. The essence of the DFM approach is, therefore, the integration of product design and process planning into one common activity. The objectives of the design for manufacture approach are to identify product concepts that are inherently easy to manufacture, to focus on component design for ease of manufacture and assembly, and to integrate manufacturing process design and product design to ensure the best matching of needs and requirements.

Stoll, Henry W. (Industrial Technology Inst). *Manuf Eng* v 100 n 1 Jan 1988 p 67-73.

**086135 TOWARDS SOCIO-TECHNICAL PROTO-**

**TYPING OF WORK SYSTEMS.** Although prototyping is a technique widely used in manufacturing industry during the design development and manufacture of a new or updated project, the technique is rarely used to test out options during the design of a manufacturing system. The work organization action simulation was developed in response to a need identified in the training of engineers. Such an approach can be used to prototype socio-technical systems and explore technical options in association with the organizational structure. (Author abstract) 13 refs.

Kember, Paul (Cranfield Inst of Technology, Bedford, Engl); Murray, Hugh. *Int J Prod Res* v 26 n 1 Jan 1988 p 133-142.

**086136 DESIGN ANALYSIS THROUGH TECHNIQUES OF PARAMETRIC COST ESTIMATION.** This paper focuses on the parametric model as a tool for design engineering analysis. The technique is made relevant to routine, everyday living. It proceeds to the engineering design function with a case study of over 4000 instances where the parametric model provided estimates closer to actual costs than the traditional 'bottom-ups' means to cost estimation in an aerospace industrial application. (Edited author abstract) 4 Refs.

Daschbach, J.M. (Univ of Toledo, Toledo, OH, USA); Aggar, Henry. *Eng Costs Prod Econ* v 14 n 2 Jul 1988 p 87-93.

**Economics** See Also ARTIFICIAL INTELLIGENCE—Expert Systems; BUDGET CONTROL—Optimization; ENERGY RESOURCES; NUCLEAR POWER PLANTS—Economics; PRODUCTION CONTROL—Mathematical Models; QUALITY CONTROL—Computer Applications.

**086137 EVALUATION OF OUTLOOK FOR PRODUCT SPECIALIZATION IN POWER MACHINE BUILDING.** The unit and small-series character of production and the uniqueness of the products impose special requirements on increasing the technical production level (TPL) of power machine building enterprises, since the production turnaround time, increase in quality and increase in production efficiency all depend on its condition and further development. The development of engineering and technology, their improvement and progress largely govern not only the TPL, but also the structure and form of the production facilities of enterprises, the organizational and economic levels of the plant and the level of product specialization. The authors have proposed a procedural approach which enables us to switch from the coefficient of unification between designs to the coefficient of specialization, defined in the form of a relative quantity that enables us to compare perspective and existing levels (to evaluate perspective solutions) and establishes the volumes of centralized production of unified components and parts in a cost expression. 1 ref.

Tsitalovskii, E.A.; Mozhaikii, A.M.; Grigorev, A.S. *Sov Energy Technol* n 6 1987 p 80-84.

**086138 PRODUCT COST-ESTIMATION BY THE DESIGNER.** Shorter through-put times demand flexibility in production. Along with this, the need arises to speed the production-planning and cost-estimating activities. The designer does not have the estimator's time however, nor his skill and experience. Therefore new tools have to be developed - tools that give the designer a quick and accurate estimate of the financial consequences of his design-decisions. The article gives a survey of possible cost estimation techniques and current research efforts. For the future, an integration of Computer Aided Design, production-planning programs and cost-estimation programs using Expert Systems, is predicted. (Edited author abstract) 41 refs.

Wierda, Leo S. (Univ of Technology, Delft, Neth). *Eng Costs Prod Econ* v 13 n 3 Mar 1988 p 189-198.

**086139 TAKE FULL ADVANTAGE OF COMPUTER-AIDED COST ESTIMATING.** The benefits of advanced PC-based computer-aided cost estimating - (CACE) - accuracy, speed, consistency and flexibility - are proven and significant. The detailed information contained in a CACE printout, derived from the extensive

data on tooling, materials and labor standards accumulated in the software, could be utilized by a number of other departments. When Remmele Engineering, Inc. purchased a CACE system, in June of 1987, management was already planning which areas would benefit. Information from estimates is now used for tasks such as process planning, production control, NC programming and JIT (just-in-time) planning.

Herzog, John (Remmele Engineering Inc, St. Paul, MN, USA). *Mod Mach Shop* v 61 n 4 Sep 1988 p 92-98.

**086140 PROCEEDINGS OF THE FOURTH INTERNATIONAL WORKING SEMINAR ON PRODUCTION ECONOMICS.** The proceedings comprise 48 papers divided into 10 themes: theoretical approaches, production control, production control in a consumer electronics factory, investment and financial planning, strategic planning for production systems, inventory control, production innovation management, production information systems, transportation, product pricing and costing. The theoretical approaches section contains articles on: a multivariate utility function approach to stochastic capacity planning; comparison of the discrete and continuous-time stochastic selling models; the feasible approach to the optimization of exploitation of tree stems; dimensioning of bus driver buffers subject to variations in the traffic load; decomposition principles applied to the dynamic production and work-force scheduling problem; operation plan optimization of porcelain production; the firm's investment policy rules a concave adjustment cost function; similarities between lot sizing and clustering; and an analysis of heuristic trim-loss algorithms. Abstracts of all articles are indexed separately. Technical and professional papers from this conference are indexed and abstracted with the conference code no. 10537 in the Ei Engineering Meetings (TM) database produced by Engineering Information, Inc.

**086142 DESIGN OF A MICROCOMPUTER BASED SIMULATOR FOR PRODUCTION MANAGEMENT TRAINING.** The proliferation of independent computer based systems in some manufacturing companies has more than often led to islands of automation. The effective integration of such systems has become imperative for the complete realization of the advantages of computer based systems in the manufacturing environment. The teaching of the fundamental principles of production management and control to engineering students is suffering from the same lack of integration and a need for more effective training methods has been identified. The purpose of this paper is to demonstrate that the computerized training simulator, CIMSIM, might fulfill this need. (Author abstract) 11 refs.

Lindeque, Pieter (Univ of Pretoria, Pretoria, S Afr); Kruger, Paul S. *Comput Ind Eng* v 14 n 1 1988 p 53-62.

**086143 DISTANCE LEARNING.** Today's courses incorporate multi-media techniques including audio and video material and innovatively designed text matter. They are designed to be flexible in terms of start date, completion time and method of study and are intended for use either by an individual or as part of a company's training scheme. The course components, video and text are totally integrated to provide a method of study which is not only informative, but is easy to use and appealing to the student. The course materials are structured to use the workplace as a key source of example and exercise. In this way, direct benefits can be achieved for the individual and the company. An example, the Production Management Course, is described.

Sellers, Sheila (Henley Distance Learning Ltd). *Prod Eng (London)* v 67 n 7 Jul-Aug 1988 p 30-31.

**Efficiency** See Also TOOLS, JIGS AND FIXTURES.

**086144 COUNTERS CUT PRODUCTIVITY PLUNGE.** A 24-hour-a-day operation can be the ultimate in plant and equipment use, but with it comes the problem of maintaining consistent productivity throughout all three shifts even when supervision is at a minimum. While the application reported takes place at a manufacturer of plastic parts, the techniques used are generally applicable to any process manufacturer. (Edited author abstract)

Anon. *InTech* v 35 n 4 Apr 1988 p 49-50.

**086145 MANAGING CHANGE BY INTEGRATING MANUFACTURING AND ENGINEERING.** It is printed out that the use of a large-scale mainframe computer is often overlooked as a method of integrating a company's many data requirements. It is reported that a given company's customers have found that improving the product introduction cycle has enhanced their ability to respond to change. Reducing design times and speeding the transition from engineering to manufacturing can make possible broader product line-ups, products with more features, lower cost responses to market changes, and an ability to react quickly to technological advancements.

**086146 SINGLE MACHINE SETUP-DEPENDENT SEQUENCING USING A SETUP COMPLEXITY RANKING SCHEME.** This paper presents a group technology-based heuristic for the single machine setup-dependent sequencing problem. An earlier approach of multiple classification analysis used the 'nearest neighbor' approach for solving the traditional 'traveling salesman' structure of this problem. The new heuristic uses the clustered traveling salesman analogy for the problem to incorporate a one-dimensional clustering algorithm. Intrafamily and interfamilial sequencing of parts is achieved by using an absolute measure of setup complexity assuming a bare machine before setup. This measure requires that significant setup attributes be ranked in the order of decreasing complexity. The inspection approach to the selection of similar parts is eliminated in this approach. An optimal solution is not guaranteed by this method. It yields a dominant set of schedules which can be evaluated with time studies. Two examples from the literature are solved using this method. Extensions of the method to the rationalization of machine tool design are proposed. (Edited author abstract). 19 Refs.

Irani, Shahrugh Adi (Pennsylvania State Univ, University Park, PA, USA); Gunasena, Udaya; Davachi, Ali; Enscore, E. Emory. *J Manuf Syst* v 7 n 1 1988 p 11-23.

**086147 MINIMAX METHOD OF MEASURING PRODUCTIVE EFFICIENCY.** A class of minimax methods for measuring productive efficiency is proposed here and compared with two other methods currently available in the literature. Some advantages of the minimax methods such as robustness and probability maximization are analyzed both theoretically and empirically. The empirical results show some aspects of superiority of

the class of minimax methods proposed here. (Author abstract). 8 Refs.

## Energy Conservation

**086148 NOTWENDIGKEITEN UND MOEGLICHKEITEN DER STOFF- UND ENERGIEEINSPARUNG IN DER PRODUKTION.** [Necessities and Possibilities of Material and Energy Savings in Production Processes]. Energy and material flows are to be used optimally in industry, which is of business-management as well as national-economy interest. This means for the production of goods that the losses of energy and raw materials should be kept at the lowest possible level. For achieving this aim, the author suggests an approach in which the production process is taken as an irreversible thermodynamic process, and in which the objective of the production is geared towards the minimization of the entropy increase. The paper describes the strategy of applying the energy and the raw material, the evaluation factors of a production process, the possibilities of recovering the energy and raw material. Finally, two examples are given to show clearly, how this new approach improved the conventional processes. (Author abstract) 5 refs. In German.

Scharmer, K. *Brennst Waerme Kraft* v 39 n 12 Dec 1987 p 535-538.

## Management

**086149 POTENTIAL OF RECONSTRUCTABILITY ANALYSIS FOR PRODUCTION RESEARCH.** Reconstructability analysis is a package of methodological tools for dealing with the relationship between wholes and parts in the context of computer-aided system modeling. The applicability of reconstructability analysis in industrial engineering and production research is the primary purpose of this paper. It is illustrated by simple examples based upon data obtained from psychophysiological and ergonomic experiments under real working conditions. (Edited author abstract) 34 refs.

Kliir, G.J. (State Univ of New York, Binghamton, NY, USA); Mariano, M.; Pittarelli, M.; Kornwachs, K. *Int J Prod Res* v 26 n 4 Apr 1988 p 629-645.

**086150 BOTTLENECK GENERALIZED ASSIGNMENT PROBLEMS.** We discuss bottleneck (or minimax) versions of the generalized assignment problem. The basic problem involves the assignment of a number of jobs to a number of agents such that each job is performed by a unique agent, and capacity limitations on the agents are not exceeded. Two versions of the bottleneck generalized assignment problem (BGAP) are defined. The first of these is called the Task BGAP and has as its objective the minimization of the maximum of the costs of the assignments that are made. The second version is referred to as the Agent BGAP and has as its objective the minimization of the maximum of the total costs assigned to each agent. Both problems are formulated, and applications are discussed. Procedures for solving the Task BGAP are presented, and one of the procedures is illustrated in an example. (Author abstract) 22 refs.

Mazzola, J.B. (Duke Univ, Durham, NC, USA); Neebe, A.W. *Eng Costs Prod Econ* v 14 n 1 May 1988 p 61-65.

**086151 SCHEDULING IN LARGE SCALE PRODUCTION SYSTEMS: A MEDIUM TERM PRODUCTION MANAGEMENT MODEL.** This paper describes a medium term production management model, where the system is partitioned into production subsystems and part families. The goal of this research is to evaluate the production rate, which minimizes the cumulative inventory cost over a given planning horizon. (Author abstract) 5 refs.

Meier, Klaus (INRIA, Vandoeuvre Les Nancy, Fr); Proth, Jean-Marie. *Eng Costs Prod Econ* v 14 n 1 May 1988 p 67-74.

**086152 LONG RANGE PROCESS DESIGN AND COMPATIBILITY AMONG OPERATIONS.** This paper presents an efficient algorithm with computational results for identifying all feasible designs based on compatibility considerations. The implementation issues, both computational and organizational, are discussed as integral parts of a framework for process design efforts. This framework combines the advantages of both the traditional and morphological approaches and mitigates their disadvantages. It also facilitates interaction between the expert's judgment and the programmed model. (Edited author abstract). 13 refs.

Singhal, Jaya (Univ of Baltimore, Baltimore, MD, USA); Singhal, Kalyan; Weeks, James K. *Manage Sci* v 34 n 5 May 1988 p 619-632.

**086153 CREATING A COMPETITIVE MANUFACTURING STRATEGY.** To ensure a systems approach to business redesign, a 5-step approach is needed. This includes: data collection on markets, product volume, factory processes; engineering analysis to define volume-variety groups, Pareto structures, product/component categorization; define business architecture with the business unit divided into units (manufacturing and service); dynamic design by identifying potential change sources; definition of information flow requirements/paperwork systems. Manufacturing strategy has to be underpinned by the five step design process and be seen to be an equal partner with the other segments of strategy, Sales and Marketing strategy - Product Engineering strategy - Manufacturing Systems Engineering strategy - Business systems Engineering strategy. These must all be detailed and integrated into a total business strategy by an input-output matching approach. 8 Refs.

## Operations Research

**086157 SENSITIVITY ANALYSIS AND OPTIMIZATION OF THROUGHPUT IN A PRODUCTION LINE WITH BLOCKING.** It is pointed out that production lines with limited storage capacities can be modeled as cyclic queueing networks with finite buffers and general service times. A technique called perturbation analysis of discrete-event dynamic systems is applied to these queueing networks. An estimate of the gradient of the system throughput is obtained by perturbation analysis, based on only one sample trajectory of the system. It is shown that the estimate is strongly consistent. Using this perturbation analysis estimate of gradient, it is possible to apply the Robbins-Monro stochastic procedure in optimizing the system throughput. Compared to the conventional Kiefer-Wolfowitz optimization procedure, this approach saves a large amount of computation. For a real system, the gradient estimate can be obtained without changing any parameters in the system. The results also hold for systems with general routing but in which no server can block more than one other server simultaneously. 19 refs.

**Optimization** See Also ELECTROPLATING—Productivity; INDUSTRIAL PLANTS—Flexible Manufacturing Systems.

**086158 OPTIMAL PRODUCTION RUN FOR A PROCESS HAVING MULTILEVEL TOOL WEAR.** This paper considers the problem of selecting the most economical production run for a continuous process having multi-tool machines. Each tool may have different but similar wear characteristics. The process produces a certain type of product having two measurable quality control characteristics which jointly determine the effectiveness of the product. Simultaneous gradual changes in process means and process variances are experienced as the time passes due to tools wearing out. An expected total cost per unit is developed which consists of the cost of resetting the tools, the cost of defective items, the loss of production cost due to shutdown, and the sampling cost. An optimal production run is determined by employing a one-dimensional Fibonacci search technique on the expected total cost function. A graphical method is also provided to determine the optimal production run. Numerical examples are provided to demonstrate the applications of the model. (Edited author abstract) 7 refs.

**086160 MINIMUM CONCAVE COST PRODUCTION SYSTEM: A FURTHER GENERALIZATION OF MULTI-ECHOLON MODEL.** We consider a concave minimization problem associated with a series production system in which raw material is processed in  $m$  consecutive facilities. The products at some facility are either sent to the next facility or stocked in the warehouse.

The amount of demand for the final products during period  $i$ ,  $i = 1, \dots, n$ , are known in advance. Our problem is to minimize the sum of processing, holding and backlogging cost, all of which are assumed to be concave. The origin of this model is the classical economic lot size problem of M.H. Wagner and T.M. Whitin. The purpose of this paper is to extend the model further to the situation in which time lag is associated with processing at each facility. We propose an efficient  $O(n^4 m)$  algorithm for this class of problems. (Edited author abstract). 11 Refs.

**086162 VARIANCE OF THE NUMBER OF UNITS PRODUCED ON A TRANSFER LINE WITH BUFFER INVENTORIES DURING A PERIOD OF LENGTH T.** The transfer-line models in the literature are planning models rather than operational models. The performance measure used in these models is the efficiency of the line A. The expected number of units produced during a period of length T cycles is AT. In this article a procedure is presented for calculating the variance of the number of units produced by the transfer line during a period of length T cycles. These two performance measures can be used to construct an interval estimate for, say, the number of units produced during a shift. (Edited author abstract) 9 refs.

**086163 PROCESS PLANNING PERFECTS PRODUCTION.** The process plan is a set of sequential work instructions for making a particular product. It specifies the essentials such as materials, processes and routings. But different planners may take different routes, including different manufacturing operations and sequences, in arriving at the production of any given product. Subjects covered include group technology, classification methods, computer-aided processes planning, and others.

**086164 BUSINESS RESOURCES PLANNING SYSTEM.** Concepts of business resources planning are cornerstones of the AT&T project that has become known as BRPS (Business Resources Planning System). Under the BRPS project umbrella is a family of integrated initiatives that address the manufacture and distribution of AT&T products in a market-focused environment. Elements of the BRPS project specify the functional architecture, the management processes, policies, procedures, and accountabilities necessary to mold the functions of business planning and execution into a total closed-loop control system. The scope of the BRPS project spans a gamut of manufacturing planning and execution functions, from interfaces with sales and marketing to interfaces with material suppliers. Included

within the purview of the BRPS system model are modules for planning, control, and performance measurement for demand management, distribution network operations, and material acquisition and facility management. Through a hierarchically defined specification of the processes and data needed for a total business system, BRPS provides criteria for identifying software solutions and procedural solutions. **086165 SEMI-GENERATIVE APPROACH TO COMPUTER-AIDED PROCESS PLANNING USING GROUP TECHNOLOGY.** Computer-Aided Process Planning (CAPP) has a key role in Computer-Integrated Manufacturing (CIM) as an interface between design and manufacturing. This paper reports on a research effort that had as a major thrust the demonstration that a correctly designed Group Technology (GT) part coding scheme can assist in generating the sequence of machine operations for making the part. To exemplify the approach, a 14-digit chain-structured GT code was designed to capture the part features for the most common rotational/gear part shapes using DCLASS information processing trees. The GT code was then processed to generate process plans using a semi-generative CAPP approach that integrates sets of machining operations for part basic shapes and form features. The results have shown promising perspectives of GT application in CAPP. (Author abstract) 14 refs.

**086169 METODO PRIMAL DUAL PARA MODELOS DE PLANIFICACION CON COSTES CONCAVOS Y LIMITACIONES DE CAPACIDAD.** [Primal-Dual Approach to the Capacitated Production Planning Problem with Concave Costs]. This paper studies the production planning problem represented by a concave

model subject to capacity constraints. The linear relaxation of the model is analyzed using a primal-dual approach. Solutions to the dual are obtained solving one product uncapacitated models penalizing the capacity restrictions. The restricted primals correspond to feasibility tests of the dual implied solution. The restricted dual informs on the recommended new penalties for the capacity restrictions. The paper concludes with a proposed algorithm to select the increasing penalties to guarantee monotone improvements toward the optimal solution. (Author abstract) 7 refs. In Spanish.

**086172 ANALYSIS OF HEURISTIC TRIM-LOSS ALGORITHMS.** In industry, a wide variety of materials, such as steel, glass or paper has to be cut into smaller pieces to fulfill production requirements or to satisfy customers' needs. This study concentrates on low order polynomial algorithms to get near optimal solutions for such problems. Four of these algorithms were presented in papers by Coffman et al. and Sleanor in 1980. Additionally two improved algorithms for the two-dimensional trim-loss problem are developed. In an extensive computational analysis it is shown that one of the improved heuristics yields solutions better than or equal to the others in more than 90% of all analyzed problems. (Author abstract) 2 refs.

**086173 SURPLUS OR DISPOSAL QUANTITIES IN OPTIMAL PROGRAM PLANNING IN JOINT PRODUCTION.** For an optimal design of a production program in joint production (multi-product output from one raw material) one has to take into account that partial quantities of production have to be included which can neither be used within the production process nor marketed. These quantities are called surplus or disposal quantities. The paper is concerned with the question to what extent the optimal design of a production program in joint production is affected by variable disposal costs and maximum disposal quantities, while all the other data remain constant. For this purpose we start from a generalized formulation approach based on a linear programming model with parametrically variable disposal costs and maximum disposal quantities. The results show that deliberately allowing for surplus quantities under

profit aspects is still advantageous, even if comparatively high disposal costs have to be taken into account. (Edited author abstract) 13 refs.

**086174 SEEKING CLARITY IN INDUSTRIAL ORGANIZATIONAL PROJECTS.** Many industrial firms have undertaken large internal projects aimed at boosting productivity and competitiveness. They include major changes in the existing product programme, in the production system, and in the organization. Many divisions, sections and employees are to be involved. Such projects differ from traditional productivity improvement projects and from projects on designing and erecting engineered facilities. The paper characterizes such large internal, industrial projects. It is argued that seeking clarity is a countermeasure in the complex and fuzzy world in which many industrial projects are imbedded. Four methods for increasing clarity in complex organizational projects are proposed and discussed. (Edited author abstract) 5 refs.

## Quality Control

**086176 LE CONTROLE DE LA QUALITE DES FABRICATIONS. [Manufacturing Quality Control].** Non-destructive testing is widely used during manufacture and assembly of power plant components, in order to assess the quality of the finished parts. Selection of the appropriate technique and interpretation of the results often require complete knowledge of the manufacturing process, and the most likely types of potential defect. Controllability is strongly dependent on material selection and component design. Standardization of practices and specification of acceptance criteria must be based on extended field experience. Testing reliability can be improved by automatic systems and data processing. (Author abstract) In French.

**086181 SYSTEMS RELIABILITY AND THE AMTA PROJECT.** The promise of advanced manufacturing technology (AMT) is one of high productivity, high quality, lower labor costs, minimum work in progress, all this in return for higher capital investment. To achieve these goals high utilization is a primary requirement. This is a situation which exists in the power generation and process industries where availability and reliability are considered as basic design parameters. A pilot project concerned with integrated manufacturing systems, but also including conventional machines was carried out in conjunction with the Production Engineering Research Association (PERA) and a number of leading firms with the support of the Department of Trade and Industry (DTI). This focused on failure data collections and analysis because this was what most of the firms felt that they needed primarily and because the NCSR Data Bank had as then insufficient specific data to meet the firm's needs. This project enabled NCSR to develop the methods already in use more widely for reliability data collection and analysis to suit this particular requirement and take advantage of high-tech developments in computerized data bases which were concurrent.

## Research See Also MARKETING—Management

**086182 PREDICTION OF THE SYSTEM EFFICIENCY OF BALANCED AUTOMATIC TRANSFER LINES.** This paper presents a simulation study of the system efficiency, in terms of production rate, of automatic transfer lines. A particular type of system, referred to as balanced automatic transfer lines, is considered in the study. In such a balanced automatic transfer lines, the situations are considered identical in terms of availability and the buffers are uniformly allocated, and only four

system design parameters are involved, namely the number of situations, the identical failure and repair rates, and the uniform buffer capacity. Based upon simulation results, an empirical production rate equation is established by using available optimization techniques for fitting non-linear functions. (Edited author abstract) 31 refs.

**086185 EVALUATION OF STATIC FLOWSHOP SCHEDULING HEURISTICS IN DYNAMIC FLOWSHOP MODELS VIA A COMPUTER SIMULATION.** This paper provides an evaluation of static flowshop scheduling heuristics for minimizing makespan as an objective function in the dynamic flowshop model. A total of 16 scheduling heuristics including several revisions and combinations of previously reported methods are summarized. The scheduling rules are evaluated via computer using a SLAM discrete event simulation model. The results for the simulation are analyzed using statistical methods. The results from the study suggest which of the popular scheduling heuristics hold promise for application to practical dynamic flowshop problems. (Author abstract) 17 refs.

Park, Yang Byung. *Comput Ind Eng* v 14 n 2 1988 p 103-112.

**086186 PRODUCTION SCHEDULING ON PARALLEL MACHINES SUBJECT TO STAIRCASE DEMANDS.** Given is a set of  $m$  unrelated machines working in parallel and a set of  $n$  independent products which have to be produced on these machines using  $p$  additional resources. A machine cannot work on more than one product at a time but a product can simultaneously be produced on different machines. For each triple (machine, product, resource) productivity per time unit is given. The objective is to minimize the total penalty following from deviations above and below production plans. The sum of machine setup costs is considered as a secondary performance measure. The problem is solved by an extension of the two phase method, Phase 1 consists in solving an LP problem and Phase 2 is the construction of the schedule which reduces to a sequence of compatible flow problems.

**086187 MULTICRITERIA SCHEDULING OF DYNAMIC PRODUCTION ACTIVITIES.** In this paper we study multicriteria production scheduling problems in which  $n$  parallel activities must be performed using continuous, renewable resources of  $s$  types. Each activity is characterized by a continuous function relating its performing speed to the amounts of resources allotted at every moment, and by the demand for the product resulting from its performance. The goal is to find optimal (in a vector sense) amounts of resources and the schedule length or the maximum lateness. We show how to reduce the scheduling problems to non-linear vector-optimization problems for given classes of activity models. (Author abstract) 7 refs.

**086188 LOCAL SEARCH APPROACH TO FLEXIBLE FLOW LINE SCHEDULING.** Local search methods are presented for scheduling a flexible flow line. The authors consider the problem of entry point sequencing, that is, deciding the order in which to present the jobs to the system. Results on test and realistic problems are described. The strength of the approach lies in its ability to take into account various line phenomena, such as setups, finite buffers, blocking and starvation, machine breakdowns and downtimes, and the current and subsequent states (at rescheduling intervals) of the line. The technique developed uses local perturbation to successively obtain improved schedules. In test cases where the optimal schedule is obtainable, solutions are produced within a few percent of the optimal. A new method is described for choosing starting sequences for local search methods which is based on the use of sphere partitions. (Edited author abstract) 14 refs.

**086190 DECOMPOSITION PRINCIPLES APPLIED TO THE DYNAMIC PRODUCTION AND WORK-FORCE SCHEDULING PROBLEM.** One of the most important problems in the production and inventory planning field is the scheduling of production and work force in a dynamic environment. Although this problem can be formulated as a linear program, it is often quite difficult to solve directly, due to its large scale. Instead, it might be fruitful to use a decomposition approach. Decomposition, in general, means decomposing a difficult problem into several easier, or a sequence of easier problems which are later coordinated to reconstruct the original problem. In this report we discuss several possibilities of applying the most common decomposition principles, namely Benders (primal) and Dantzig-Wolfe (dual), as well as a relatively new decomposition method, called cross decomposition, to the dynamic, multiproduct production and employment planning problem. A number of special cases are also presented. (Author abstract) 16 refs.

## Simulation

**086191 SIMULATION VON FERTIGUNGSABLAUFEN - BERECHNUNG DES MITTLEREN BESTANDES UND DER MITTLEREN DURCHLAUFZEIT MIT NEUEN WARTESCHLANGENMODELLEN.** [Simulation of Production Processes - Calculation of the Average Inventory and of the Average Processing Time on the Basis of New Queueing Models]. The simulation of production processes gains increasing importance for the planning and control of production plants. Methods have been used exclusively up to now which simulate the observed events stepwise in the form of a deterministic simulation model. An alternative is the reproduction of the same process on the basis of the queueing model, which may be called stochastic simulation. Queueing models, however, have so far not been successful in practice for this type of application as they are too inaccurate. This paper explains the reasons for this lack of accuracy and introduces two new queueing models for the calculation of the average inventory and of average processing time specifically for workshop manufacturing. A comparison with measured operational data and deterministic simulation results show that the model is suitable for practical conditions. (Edited author abstract) In German. 7 refs.

## Technology Transfer

**086192 POWER OF TAGUCHI METHODS TO IMPACT CHANGE IN U.S. COMPANIES.** New quality technology based on Taguchi Methods was first introduced to the U.S. automotive industry in March 1982. What evolved are fundamental changes in US engineering and quality control methods which greatly changed in the operating aspects of US companies. These operational changes will drive further improvement in the competitive position of all US industries. The ultimate benefit of Taguchi Methods education, training, and application will be to significantly shorten the product development cycle, improve quality, and reduce cost. As a result, many US industries will become more competitive in world markets.

v 40 n 10 Oct 1987 p 415-418.

## Accidents

**086199 PIPER IN PERSPECTIVE: CAUSES AND REACTIONS.** Over two months after the most devastating disaster ever to strike the offshore industry, several major questions about the incident and its effects remain unanswered. As this is being written, the precise cause of the explosions and fire that destroyed Piper A platform 120 miles NE of Aberdeen has not been officially determined. However, the Piper A disaster has revealed deficiencies in safety practices aboard North Sea platforms involving both design and enforcement. Remedying these deficiencies is a principal goal of inquiries now being conducted by government agencies and Occidental.

Assembly See SEMISUBMERSIBLES—Design.

## Cathodic Protection

**086200 USE OF INITIAL CURRENT DENSITY IN CATHODIC PROTECTION DESIGN.** The cathodic protection systems of two platforms installed by Conoco Netherlands in the southern North Sea were based on accepted design criteria. The use of elongated anodes resulted in high initial current densities (CDs) that polarized the structures well beyond the minimum protective potential. The results of surveys conducted a few months and one year after installation are presented. An initial CD on the order of 30 mA/ft<sup>2</sup> (320 mA/m<sup>2</sup>) polarized the structures to -0.95 V with respect to silver-silver chloride reference electrode. It is shown that this initially high CD allows for lowering the maintenance CD. Cost effectiveness will be reflected in a reduced anode weight requirement and added insurance to obviate any need for premature retrofit. (Edited author abstract) 15 refs.

## Computer Aided Analysis

**086201 SOECO'S COMPUTER PROGRAMS AND SYSTEMS FOR OFFSHORE ENGINEERING.** This paper introduces the offshore engineering computer programs worked out independently by SOECO (Shanghai Offshore Engineering Corporation). These computer programs can be used for static and dynamic analysis of a jacket platform. They can also be adopted for other offshore structural calculations, e.g. jack-ups and semi-submersibles. This enables SOECO to offer a better service for offshore development both at home and abroad. (Edited author abstract)

## Concrete Construction

**086202 CONCRETE - THE COST EFFECTIVE ALTERNATIVE FOR FLOATING PLATFORM CONSTRUCTION?** A determined bid to convince oil companies that floating platforms with concrete hulls will be cheaper to build and operate than all-steel units is currently being mounted in Norway. Backed by 15 years of construction experience with fixed production installations in concrete, this drive has already evoked a positive response from several operators in Norwegian waters. This article reviews the utilization of concrete as a material for constructing offshore platforms.

Anon. *Mar Eng Rev* Oct 1987 p 32-34.

Construction See Also OIL WELL PRODUCTION—Offshore; SHIPYARDS—Productivity.

**086203 FIRST JACK-UP SIMULATOR WILL TRAIN RIG CREWS.** Jacking accidents have caused total loss of some rigs and major damage to others. To help prevent accidents of this sort, a Houston company

has developed a simulator that will be used to train jack-up crews in proper jacking procedures and emergency responses. Key components of new industry training tool include ability to simulate problems with leg punch-through and leg extraction that can result in serious accidents during critical jacking operations.

Stewart, Bil (Stewart Technology Associates, Houston, TX, USA). *Ocean Ind* v 23 n 5 May 1988 p 44-45, 47-48.

## Control

**086204 CONTROL SYSTEM FOR FLOATING PRODUCTION VESSELS.** Integrated Control systems can play a major part in reducing costs and easing operations of a floating production system. Costs can be reduced during design, construction, commissioning and operations, and savings can also be realized on system configuration and modernization. The main control system for the Balmoral floating production vessel combines distributed digital control with a supervisory computer to provide great design flexibility and plant-wide integration. 2 refs.

Corrosion See Also OIL WELL DRILLING—Rigs.

**086205 IMPROVED MONITORING OF BACTERIALLY MEDIATED CORROSION RISKS IN OFFSHORE SYSTEMS.** The major problem encountered by the petroleum microbiologist working in the North Sea oilfields is that of convincing the oilfield engineer that bacterial corrosion is a subject worthy of serious attention. Although many bacteria play a role in bacterial corrosion, the chief culprits are the sulfate-reducing bacteria (SRB). The SRB constitute a diverse group of bacteria which are characterized by two major factors in their metabolism. Firstly, they grow only under strictly anaerobic conditions; i.e. in the complete absence of molecular oxygen. Secondly, their growth is always associated with the production of sulfide; either as hydrogen sulfide, or as precipitated iron sulfide. The production of sulfide is due to the reduction of sulfate during the metabolic processes essential for growth. In this study the problem addressed was that of the potential for sulfide mediated corrosion processes to proceed in specific areas during offshore operations in the North Sea. 21 refs.

Maxwell, Stephen (Corrosion Specialists (North Sea) Ltd, Aberdeen, Scotl). *Q J Tech Pap Inst Pet* Jul-Sep 1986 p 1-25.

## Corrosion Protection

**086206 PROTECTION STEEL LEGS.** When the gas platforms were being designed for Morecambe Bay it was realized that conditions would be more demanding even than those in the North Sea. To obtain an economic life the steel legs of the platforms had to be protected from corrosion, abrasion and biofouling caused by the sea. This article discusses the techniques employed.

Anon. *Mar Eng Rev* Apr 1987 p 20-21.

Design See Also OFFSHORE STRUCTURES—Design; OIL WELL PRODUCTION—Offshore; OIL WELL PRODUCTION—Sub-sea Production System.

**086207 DESIGN OF PRODUCTION FACILITIES FOR FLOATING OFFSHORE PLATFORMS.** The authors shed some light on current progress and experience gained in the design of floating production facilities. Operators are moving towards subsea completion, with specially designed wellheads installed on the sea bed, and floating production facilities (FPFs) to help improve the economics of new field development. An FPF may be a barge, a tanker, a semi-submersible or a tension leg platform. The most common technical and economic considerations which favour FPFs, apart from possible lower initial capital costs are: the shorter schedule for overall project completion which improves cash flow by

advancing the start of production; improvement of field appraisal by extended production testing from initial wells; use on small fields with short production life, even in shallow waters. The various types of floating facilities, such as tankers which have been converted, semi-submersibles, and the tension leg platform are discussed. Process facilities on the fixed platform are also detailed. Oil production process design and riser systems are also discussed.

Head, John (John Brown Engineers & Constructors Ltd, London, Engl); Rumley, Jim. *Chem Eng (London)* n 432 Jan 1987 p 17-21.

**086208 SEMI-SUBMERSIBLE FLOATING PRODUCTION VESSEL FOR ICE INFESTED WATERS.** At the present time there is considerable interest in Floating Production Systems and many new designs are emerging. Many of these new designs tackle the problems of deep water and small accumulations. This paper describes a semi-submersible production vessel designed by Floatech and Submarine Engineering for use in an icy environment, an alternative 'way forward' for Floating Production Systems. Two versions of the SSPV design have been produced, one equipped for drilling and the other without. This paper is concerned with the non-drilling version and describes the special features of the design which enable it to be used in the harsh environment such as that found off the Newfoundland Grand Banks.

Jordan, P.A. (Floating Technology Co); Haavie, T.O. *Q J Tech Pap Inst Pet* Jan-Mar 1986 p 19-35.

**086209 PRODUCTION DESIGN FOR FLOATING PLATFORMS.** The anticipated motion of a floating production facility (FPF) has considerable impact on the design of motion-sensitive process equipment. The FPF design contractor normally defines that motion under 'design sea conditions', and it is important that such data are made available early in the design program because some items of motion-sensitive equipment may be on long delivery schedules. A discussion is presented of the effects of motion on equipment performance such as separators, oil treaters, tray columns, liquid knock-out drums and instrumentation. Design layout considerations are addressed along with environmental limitations.

Head, John (John Brown Engineers & Constructors Ltd, London, Engl); Rumley, Jim. *Chem Eng (London)* n 438 Jul 1987 p 17-22.

**086210 DESIGN AND ITS TECHNICAL ASPECTS FOR FLOATING PRODUCTION AND TESTING SYSTEM (PTS).** The PTS (Production and Testing System) was conceptually developed by K/S Petrojarl I A/S, Norway as the prototype of its kind, and was designed in detail and constructed by Nippon Kokan K.K. It is a ship type floating production unit, adopting the turret mooring system. Due to the motion and moored condition of the floating hull, the production systems and facilities are susceptible to certain limitations of each function. This report presents measures to lessen the hull's motion and upgrade mooring, position keeping and other functions so that each system and facility are effectively and economically operated in safety under the environmental offshore conditions. (Author abstract) 3 refs.

Jibiki, Yoshimichi (Nippon Kokan K.K., Jpn); Watanabe, Toshihiro; Sato, Shoichi; Yamauchi, Hachiro; Komiya, Haruhiko; Ishida, Sho. *Nippon Kokan Tech Rep Overseas* v 50 Sept 1987 p 62-73.

**086211 UNIQUE PLATFORM DESIGN STUDIED FOR 2,000-FT WATER.** Doris Engineering of France has designed a hybrid compliant tower/fixed jacket platform called the Delta Tower, which might be used to develop ultra-deep water oil and gas fields in the U.S. Gulf of Mexico. Recently, 10 oil companies joined with Doris in a joint industry project to further investigate the potential of the idea. The project involves a compliant tower attached to the top of a fixed jacket. The tower can move with the waves, pivoting on top of the jacket and effectively filtering-out most of the dynamic wave loading. The fixed jacket transmits the remaining loads to the

foundation. This article describes the preliminary design of the structures for a payload of 15,000 tons in water depths to 2,000 ft for Gulf of Mexico environmental conditions.

Anon. *Ocean Ind* v 23 n 4 Apr 1988 p 58-59.

**086212 NEW PLATFORM DESIGNS MAKING GULF OF MEXICO ENTRANCE.** Oil and gas operators in the Gulf of Mexico, as well as the rest of the world, have shifted their focus to reducing costs of bringing oil and gas reserves on stream and development and use of better technology. Smaller fields in deeper waters located farther from consuming areas require greater efficiency. Most oil and gas companies see the subsea-based production system and the tension-leg platform as the two best-developed methods now available to the industry for very deep water. Each has its advantages, and both systems likely will be applied in the Gulf of Mexico many times. Several state-of-the-art production systems have recently been installed or are planned in the next several years in the Gulf of Mexico. Placid installed the first floating production system in 1540-foot waters in the Gulf of Mexico's Green Canyon area in late 1987/early 1988; it is the first system to be developed for permanent use with survivability in 100-year hurricane conditions. Bullwinkle, the world's tallest fixed steel production platform, made out of prefabricated components, was scheduled to be installed in May 1988 in 1353-foot waters in the Green Canyon area offshore Louisiana. Another new type of oil production platform being marketed for the Gulf of Mexico is the French design Roseau tower, a compliant structure.

Pagano, Susanne S. (Sea Technology, Arlington, VA, USA). *Sea Technol* v 29 n 4 Apr 1988 p 15-17.

**086213 INNOVATIVE TLWP IS KEY TO DEVELOPMENT OF DEEP WATER FIELD.** Since Conoco first announced plans early last year for the first tension-leg well platform (TLWP) for the Gulf of Mexico, this single project has created significant interest within oil and gas industry circles. The Du Pont Company subsidiary captured the limelight in the oil and well platform, a shallow-water tie-back platform to handle production, pipelines, and the drilling of wells. This is the largest domestic offshore project in Conoco's history and the U.S. debut for tension-leg technology, which will substantially reduce the exorbitant cost of deep water oil development.

Pagano, Susanne S. (Sea Technology, Arlington, VA, USA). *Sea Technol* v 29 n 4 Apr 1988 p 19-20.

**086214 TLP DESIGN ENGINEERED FOR CAREFUL COST CONTROL.** Tension leg platform (TLP) technology has developed rapidly and diversified over the last 4 years as operators seek systems for deepwater production needs. GVA has presented a TLP design to U.S. Gulf Coast operators which aims to refine and optimize TEP technology. In its main outlines, GVA's TLP concept resembles its semi-submersibles and the floating production vessel built for Sun Oil's Balmoral field. Structural innovations in the TLP concept include a new type of open deck, an all-welded design for column-/pontoon nodes and close consideration of cost-effective fabrication techniques. They have been developed to provide an efficient, strong, lightweight structure suitable for low-cost construction methods. 4 refs.

Anon. *Ocean Ind* v 23 n 6 Jun 1988 p 31-34.

**086215 UNIQUE DESIGN, STRICT OPERATING RULES MARK ZUIDWAL FIELD.** Some 18 years after discovery, and after 14 years of negotiations to obtain a production permit, a gas field in the environmentally sensitive Waddenzee along the Dutch coast is scheduled to go onstream this fall. Zuidwal field will begin producing October 1 from an unusual platform, and under strict operating rules. For instance, there can only be a single unmanned drilling platform, designed to blend into the surroundings. Processing on the platform is restricted to simple dehydration. No solids or liquids are allowed into the waters; all liquids, including rain water, are collected

in containers and taken ashore by barge. Flaring at night is forbidden and the platform does not have the myriad lights that festoon platforms in the North Sea. In addition, there are strict limitations on noise. All visits are by boat, since helicopters are banned except in emergencies and hovercraft are forbidden.

**Maintenance**

**086217 MAINTENANCE OF RIGS IN LAY-UP.** The collapse in crude oil prices has resulted in many rigs being laid-up awaiting further work. Each representing an investment of as much as \$100M, these rigs must be preserved in good working order. This article explains how.

Thomas, J.W. (BP Shipping's Lay-Up Services Branch). *Mar Eng Rev* Apr 1987 p 17-18, 21.

**Materials**

**086218 DEVELOPMENT OF ULTRA-HIGH-GRADE STEELS FOR MOSSGAS.** In South Africa, Iscor will be producing approximately 60 000 tons of steel for the production platform and 84km-long dual pipeline of the Mossel Bay liquid fuel from gas project after having been accepted as supplier of the ultra-high grade steels required for the offshore development. Most of the steel will be a special version of BS 4360 grade 50E. About 1 800 tons of a lower strength grade will be required, as well as a small tonnage of seamless tubes. The article describes the development of the special steels.

van Wyk, Willem (Iscor). *S Afr Mech Eng* v 37 n 10 Oct 1987 p 509, 511, 513.

**086219 HIGH PERFORMANCE MATERIALS.** For the extraction of oil or gas from the sea bed, as in few other industries, material selection and design require greater attention in order to achieve a predictable life expectancy through correct choice of material and its correct installation. There are a number of critical areas on a platform involving materials resistance to elevated temperatures and corrosion. This paper seeks to evaluate the choice of high-performance materials for various applications and present some guidelines for selection, with special reference to the reliability of the various options in available fabrication and welding processes. Attention is drawn to the use of titanium alloys, nickel alloys and austenitic high molybdenum alloys, duplex steels and copper base alloys. (Author abstract). 6 Refs.

Taylor, M.D. (VDM Technology). *FWP J* v 28 n 5 May 1988 9p.

**Mooring**

**086220 STUDY LOOKS AT SYNTHETIC FIBER ROPE FOR DEEP WATER RIG MOORING.** Omega Marine Services International (OMSI) of Houston, Texas, has organized a team to conduct a Joint Industry Project

to assess the readiness of synthetic-fiber rope for use in deep water moorings. Several synthetic fibers hold potential for application to deep water moorings. A good start has been made toward qualifying the aramid fiber Kevlar for such an application. It has been tried unsuccessfully as the mooring line material for a derrick vessel during the insulation of Exxon's Lena guyed tower, but subsequent mooring system tests have been successful. OMSI will perform a testing program designed to provide statistically meaningful results. A minimum of three test specimens will be used in each test to provide a statistical confidence level. The focus of the testing will be on the wet breaking strength, wet cyclic load testing, and wet fatigue life (durability) of the rope.

Hervey, Don (Omega Marine Services Int). *Sea Technol* v 29 n 7 Jul 1988 p 10-14,16.

#### North Sea See Also OFFSHORE STRUCTURES—Earthquake Resistance.

**086221 ELEVATION OF EKOFISK.** In the North Sea, six of the nine platforms on the Ekofisk Complex have been elevated some 20 feet to compensate for an increase in water depth caused by subsidence of the ocean floor. Since production began in 1971, subsidence is estimated to be about 12 feet. This article briefly describes the major steps in the elevation project.

#### Painting See OFFSHORE STRUCTURES—Protective Coatings.

#### Removal See Also OFFSHORE STRUCTURES—Removal.

**086222 REMOVAL AND ABANDONMENT OF OFFSHORE PLATFORM TOPSIDES.** In European waters there are approximately 215 fixed steel platform installations, many of which are small and weigh only hundreds of tonnes. There are also 18 concrete platforms. At some time in the future these installations will have to be removed partially or totally. The first part of this paper reviews the extent of work necessary to remove the 'topsides' of such platforms. The paper also considers the possibility of demolishing steel platforms at their installed site by toppling them to the sea bed, where water depth permits this kind of operation. The final part gives an indication of the costs. (Edited author abstract)

Boyd, Norman (Taylor Woodrow Offshore Ltd). *Q J Tech Pap Inst Pet* Jul-Sep 1987 p 43-45.

**086223 NEW CONNECTOR PROMISES EASY PLATFORM REMOVAL.** Houston-based Offshore Technologists Ltd. is developing a simple, positive, permanent pile connector with a releasable mechanism that will eliminate the need for grouting in main and skirt pilings. The releasable feature will greatly facilitate removal of future offshore platforms. The connection will be particularly economical for applications where grouting would involve significant use of costly offshore construction equipment.

Anon. *Ocean Ind* v 23 n 6 Jun 1988 p 39.

**086224 FIRST PLATFORM REMOVAL FROM DUTCH SHELF.** Pennzoil Nederlands Co., faced with the prospect of removing an obsolete platform from a depleted field in the Dutch North Sea, recently opted to remove the six-pile satellite platform from its Block K/13-D gas field in 85-ft water. The platform removal, successfully undertaken by Heerema, is the first oil and gas installation to be removed from the Dutch Shelf and only the second such undertaking in the North Sea. The removal sequence selected by Heerema engineers called for the entire structure to be removed in three separate lifts using the company's semi-submersible crane barge (SSCV) Balder.

Anon. *Ocean Ind* v 23 n 6 Jun 1988 p 42.

#### Repair See Also OFFSHORE STRUCTURES—Repair.

**086225 TEMPORARY PIPELINE PLUG SAVES TIME AND MONEY.** Phillips Petroleum Co. used a unique temporary plug to block a 36-in. gas line during its recent Ekofisk field repair that involved jacking up seven steel platforms and all associated equipment and piping to compensate for subsidence. The HydroTech Sub Sea Systems Ltd. dual module HydroPlug prevented blow-down of some 90 mi of pipeline to atmospheric pressure between Ekofisk and the nearest pumping station which was also the closest shut-in point on the pipeline. Use of the plug saved significant time, a huge waste of gas and much expense, and allowed the jack-up program to begin with a minimum constraint on lead time.

Thomson, Brian (HydroTech Sub Sea Systems Ltd, Aberdeen, Scotl). *Ocean Ind* v 23 n 4 Apr 1988 p 148.

#### Reviews

**086226 HUTTON TLP MARINE OPERATIONS.** This paper reviews the planning and execution of the marine operations for the Hutton tension leg platform (TLP), including well template installation, site preparation, foundation installation, temporary anchorages, mating, major tows, and TLP installation. Planning the work to meet project objectives resulted in the use of a number of new techniques and advanced equipment applications. These included underwater pile hammers and special acoustic equipment to provide positioning information during underwater operations. However, the detailed planning that preceded each operation enhanced the effectiveness of the equipment significantly. Further, it contributed materially to the attainment of first oil only 22 days after TLP installation. (Author abstract) 6 refs.

#### Service Life See OFFSHORE STRUCTURES—Service Life.

#### Testing

**086227 AUTOMATIC STRESSES ACQUISITION AT HOT SPOT OF TUBULAR JOINTS IN THE OFFSHORE DRILLING PLATFORMS.** A new technique which combines photoelastic testing with digital image processing (DIP) technique is described in this paper, from which photoelastic data are acquired, processed and analyzed automatically. The technique has been employed to analyze the hot spot stresses of tubular K and T joints in offshore drilling platforms, and the results are satisfactory. (Edited author abstract) 6 refs.

Wei, Yanan (Shanghai Jiao Tong Univ, Shanghai, China); Qi, Feihu; Wang, Xiangdi; Zhang, Liying; Hu, Cuixian. *China Ocean Eng* v 1 n 2 May 1987 p 33-39.

#### Transportation

**086228 ARTICULATING BARGE CUTS DEEPWATER PLATFORM COSTS.** The ability to tow out and launch platform jackets using conventional barges would seem to be approaching economically feasible limits with Shell Offshore Inc.'s Bullwinkle project. This 1,368-ft structure weighing 50,000 tons required Heerema's newly built 850-ft launch barge, the world's largest, which Bullwinkle nevertheless overhung some 400 ft at the top end. It is likely that another conventional jacket structure or compliant tower even larger than Bullwinkle will be proposed for deepwater production in the Gulf, creating demand for greater launch barge capabilities. If that happens, one of the candidates for consideration will be McDermott International's articulated launch barge concept which the company is now marketing. McDermott claims the articulated barge could provide a launch capability for a 1,600-ft jacket or compliant tower superior to that of a 1,000-ft conventional barge, and at a lower cost.

Anon. *Ocean Ind* v 23 n 6 Jun 1988 p 40-41.

#### Wave Effects

**086229 APPROXIMATE METHOD TO COMPUTE THE DRIFT FORCE ON AN ARRAY OF VERTICAL CYLINDERS.** An approximate method to compute the drift forces on semisubmersible platforms is presented. The platform is supposed to have vertical, circular columns. It is assumed that the drift forces are governed by the scattering of waves from vertical columns only. The interaction between the columns is treated in a simplified manner; only the effects of phase shifts in the wave are included. Under these assumptions the drift forces may be estimated without use of general programs based on diffraction theory. The method is suited for estimating the drift forces on floating platforms at an early design stage before more advanced numerical tools are applied. The drift forces as computed by this simplified approach are compared with the drift forces obtained by use of a panel method approach. For the two platforms used in the comparison the agreement between the two methods is satisfactory. (Edited author abstract) 18 refs.

Nielsen, Finn Gunnar (Norsk Hydro Research Cent, Bergen, Norw). *Appl Ocean Res* v 10 n 1 Jan 1988 p 35-42.

#### Welding

**086230 TRANSFER OF WELDING TECHNOLOGY FOR THE OFFSHORE INDUSTRY.** The Moss-gas project will place demands on material technology and welding engineering for the construction of the fixed offshore platforms. The grade to be used for primary structural components for the project is BS 4360-50E, now locally produced by Iscor in South Africa. In addition other materials for associated pipework will be required covering a range from carbon manganese to duplex stainless steels. The article covers the mechanical properties required for the welds.

**086231 STRATEGY FOR PRODUCTIVITY IMPROVEMENT.** In the strategy described, productivity improvement is not a one-time cost reduction exercise but a continuous ongoing operation. A continuous program can improve the utilization of existing resources at comparatively low cost. The perpetual search for improvement requires innovation and involvement on the part of all concerned, widens the scope of investigation and poses questions not normally considered as opportunity potential.

Worrall, R.G. *Prod Eng (London)* v 66 n 7 Jul-Aug 1987 p 32-33.

**086232 PRODUCTIVITY IMPROVEMENTS THROUGH COMPUTER GRAPHICS: A CASE STUDY.** The Graphic Arts Department of Oak Ridge National Laboratory (ORNL) has used computer graphics for production work since 1979. From the beginning the computer graphics project has been subjected to cost/benefit analysis. As the system has evolved and the work has gotten more complex, the methods used to measure productivity have changed. This paper discusses what productivity enhancements have been gained, how productivity is measured in this changing environment, and what the present trends in productivity indicate for the future. (Author abstract) 17 refs.

Riley, Betsy A.; Slabbekorn, Morris H. *Tech Commun* v 34 n 4 Nov 1987 p 257-263.

**086233 PRODUCTIVITY IMPROVEMENT SYSTEMS FOR MANUFACTURING.** Managing information accurately and efficiently is a key function that allows AT&T to reduce manufacturing costs and improve product quality. Productivity Improvement Systems for Manufacturing (PRISM) is a family of computerized information systems supporting manufacturing execution functions for AT&T's factories. Manufacturing execution includes all factory functions involved from the receipt of materials to the making of final products, including deriving the engineering information guiding these functions. ## Analysis

**086234 ROLE OF THE SERVICE SECTOR.** As the economies of the western world swing more and more towards service activity, and those working in production industries contribute service activities within their organizations, measuring output and productivity becomes a vital concern. In this paper an economist studies the issues from a national viewpoint. Many of the ideas are directly relevant at the level of the firm or corporation. (Edited author abstract)

Nankivell, O. *Trans Inst Meas Control* v 9 n 3 Jul-Sep 1987 p 152-164.

**086235 PLANT PRODUCTIVITY MEASURE FOR 'HIGH-TECH' MANUFACTURING.** A total productivity measure was developed as part of an action research productivity analysis project of a manufacturer of computer peripheral devices. The productivity measure had to be appropriate for a broad range of automation levels, yet resolve the long-standing methodological problems of index construction in a manner intuitive to management. The difficulties encountered in attempting to institutionalize the measure point to the need for a compromise with cost accounting. (Author abstract) 20 refs.

Adler, Paul S. (Stanford Univ, Stanford, CA, USA). *Interfaces (Providence RI)* v 17 n 6 Nov-Dec 1987 p 75-85.

**086236 FRAMEWORK FOR PRODUCTIVITY ANALYSIS AT THE ORGANISATIONAL LEVEL: METHOD AND AN APPLIED CASE.** This paper outlines a framework for productivity analysis which enables both partial and total input productivities to be identified in terms of money values and their real (volume) and unit value (terms-of-trade) components. Attention is given to the specification of the production relationship, index number issues and aggregation problems. The framework is applied to a British manufacturing company, some further methodology issues being considered and the results presented. (Author abstract) 12 refs.

## Economics

**086237 ECONOMIC MEASURE OF PRODUCTIVITY, QUALITY AND FLEXIBILITY IN ADVANCED MANUFACTURING SYSTEMS.** Productivity, quality and flexibility are critical measures of manufacturing performance for justifying the investment in integrated manufacturing and production systems. The objective of this research is to define, quantify and incorporate these three measures. The conventional productivity measure was improved so that it could be used in integrated manufacturing production systems. Quality and flexibility measures were newly defined and quantified. These three measures were integrated for the evaluation of a manufacturing system as a whole. (Author abstract) 24 refs.

Young Kyu, Son (Auburn Univ, Auburn, AL, USA); Park, Chan S. *J Manuf Syst* v 6 n 3 1987 p 193-207.

## Efficiency

**086238 JUST-IN-TIME OVER THE LONG HAUL.** The concept of just-in-time (JIT) used in American industry is discussed, along with its importance in productivity. It is defined as a combination of many elements or objectives to minimize inventories, lower unit manufacturing costs, eliminate waste and inefficiencies, and obtain 'absolute' quality. The JIT philosophy is based on maintaining a smooth and uniform flow of material in manufacturing and distribution - not just into the manufacturing plant, but out to the customer as well. This can be accomplished only when the transportation linkages among the manufacturer vendors and customers are controlled.

**086239 INTERNATIONAL PACIFIC RIM PRODUCTIVITY CONFERENCE.** This conference proceedings contains 32 papers. The main topics discussed are: a review of national productivity programs; productivity measurements of white collar, knowledge intensive staff; objectives matrix/extensions applications; productivity movement/measurement/improvement in Taiwan and Japan; productivity audits; integrated manufacturing and socio-technology approaches; information integration technology; productivity strategy development; goal setting and behavioral approaches; electronic design productivity improvement; comparison of east-west strategies/approaches to productivity enhancement; managerial engineering applications; university role in technology transfer; productivity accounting; industry-academic co-operation; automated storage/retrieval system in Taiwan; total productive maintenance; effects of corporate culture, management style, organization structure on productivity; industrial cooperation; productivity improvement in sales/distribution; relationship between productivity improvement and economic performance. Technical and professional papers from this conference are indexed and abstracted with the conference code no. 11216 in the Ei Engineering Meetings (TM) database produced by Engineering Information, Inc.

**086240 PRODUCTIVITY MEASUREMENT IN MULTI-PRODUCT MANUFACTURING FIRMS.** In this paper, a systematic procedure has been described for developing a productwise productivity measurement model in a complex and dynamic multi-product multi-stage manufacturing firm. As the interdependency among various stages of production in a manufacturing firm is to be taken care of for effective monitoring and controlling various 'input' factors, a 'stagewise' productivity measurement is possible and is developed. A hypothetical manufacturing firm has been considered for illustrating the proposed model. Also highlighted are benefits of the resulting model, along with some limitations, with particular reference to conditions prevalent in India. (Author abstract) 9 refs.

**086241 METHOD TO MEASURE PRODUCTIVITY: JPL'S PRODUCT INVENTORY SYSTEM.** What is productivity and how is it measured? What does productivity mean to a technical documentation department? Is productivity relevant at all in a technical documentation production environment where all projects are 'special,' demand varying levels of effort, and consume different amounts of time? JPL's Documentation Section 648 measures productivity with its Product Inventory System, which is described in detail here. (Author abstract) 4 refs.

**086242 DEVELOPING FLEXIBLE PRODUCTIVITY MEASUREMENT MODELS USING SPREADSHEET SOFTWARE.** This paper discusses the development of a series of interactive computer models for measuring productivity. By using LOTUS 123, a series of flexible models were developed which can easily be modified to fit the productivity measurement system used by most companies. Rather than force the company's productivity measurement system to fit an available computer model, a company can now tailor the computer model to exactly fit its productivity measurement system. ## PROMETHIUM

**086244 ABSORPTION SPECTROPHOTOMETRIC AND X-RAY DIFFRACTION STUDIES OF THE TRIHALIDES OF PROMETHIUM IN THE SOLID STATE.** The anhydrous trihalides of promethium ( $Z=61$ ) were examined by absorption spectrophotometry and X-ray powder diffraction. Room temperature lattice parameters for  $\text{PmF}_3$ ,  $\text{PmCl}_3$  and  $\text{PmBr}_3$  were in agreement with those obtained by F. Weigel and V. Scherer. Two previously unreported crystallographic modifications of  $\text{PmI}_3$  were found. Each compound has been characterized on the basis of its solid state absorption spectrum, in addition to characterization by X-ray powder diffraction analysis. (Edited author abstract). 10 Refs.

## Chemical Analysis

**086245 IMPROVED METHOD FOR THE ANALYSIS OF PROMETHIUM-147.** Promethium is co-precipitated with other lanthanide elements using an inactive neodymium carrier. It is then separated from other lanthanides and actinides by cation exchange chromatography in an  $\alpha$ -hydroxy-isobutyric acid ( $\alpha$ -HIBA) medium. The remaining actinides are removed an anion exchange chromatography in a thiocyanate medium. Promethium is then co-precipitated with neodymium and determined by liquid scintillation counting. The method can be applied directly to aqueous samples and to solid samples after an initial dissolution step with a detection limit of about 0.01 Bq per aliquot. (Edited author abstract) 15 refs.

## Applications

**086246 USE OF PROPANE AS COMPLEMENTARY FEED IN A TURBULENCE CHAMBER ENGINE.** The present work describes an experiment during which propane has been injected in the inlet nozzle of a monocylinder Ricardo E-6 type diesel engine (four strokes and turbulence chamber). The influence of propane/fuel ratio (for different loads and rotation speeds) on the power the fuel consumption, the pressure and the exhaust: fumes, nitrogen, dioxides, hydrocarbons and carbon monoxide, has been studied by comparison with operating conditions with fuel only. The study shows that for operating conditions above 60% of the full load, there is a decrease of the specific consumption and a decrease of the exhaust gases temperature as well as a pressure increase and a large decrease of fumes exhaust. The analysis of gaseous pollutants levels shows that they depend on the load conditions and on the mixture ratio of the components, but in every case the difference with respect to the Diesel fuel only operation is small. (Author abstract) 10 refs.

Combustion See Also COMBUSTION; FLAME RESEARCH; FLOW OF FLUIDS—Jets.

**086247 CONTRIBUTION OF THE GAS PHASE REACTION TO THE CATALYTIC COMBUSTION OF PROPANE.** Catalytic combustion is controlled not only by surface reactions but also by gas phase reactions.

When propane is used as the fuel, the contribution of the gas phase reaction becomes significant, and fundamental information about gas phase reactions become important. In the previous study, the significance of gas phase reactions in the catalytic combustion of propane was shown, and rate constants of three step gas phase reactions which can well predict the temperature and concentration profile were proposed. In this study, the contribution of the gas phase reaction to the catalytic combustion of propane was examined quantitatively, and the role of each gas phase reaction was made clear. (Author abstract) In Japanese. 5 refs.

**086248 STUDY ON SOOT FORMATION IN PREMIXED CONSTANT VOLUME COMBUSTION.** The effects of pressure and temperature on soot formation in premixed propane-oxygen-inert gas combustion are investigated over the pressure range of 0.4 to 5.8 MPa and the temperature range of 1000 to 1800 K by using a concentration in the chamber constant volume combustion bomb. The soot concentration in the chamber center during the final stage of combustion at the highest pressure is measured by the in situ laser extinction method. It is found that the soot yield in lower temperatures rises sharply with increasing pressure, but the dependence of pressure gets weaker with higher temperatures, and that the pressure and temperature during the soot formation mainly influence the soot yield. (Author abstract) In Japanese. 19 refs.

**086249 CHEMISTRY OF PREMIXED HYDROCARBON/AIR COMBUSTION IN A FLUIDIZED BED.** Propane premixed with air in stoichiometric proportions was burned at various bed temperatures in a bench-scale (76 mm i.d.) fluidized bed. An in-bed probe was used to measure the steady-state concentration profiles of the stable chemical species. In-bed burning (bed temperature = 850°C) of the mixture was shown to be a gradual process rather than the sudden, explosive conversion measured during overbed ignition (bed temperature = 750°C). Ironically, the rapid overbed conversion which resulted in the latter case may improve the overall amount of heat captured by the bed due to the more efficient freeboard-to-bed heat transfer nearer the bed surface. (Author abstract) 9 refs.

Cracking See Also ETHANE—Cracking.

**086250 EFFECTS OF UV LIGHT IRRADIATION ON PROPANE IN AN ARGON PLASMA.** It has been shown that propane conversion into acetylene, by propane cracking in an argon plasma, is increased when the reaction site is irradiated with UV light in the range 220-400 nm. The reactions were carried out between 4500 and 6400 K. A model is outlined following which the propane conversion increase at 6400 K (40%) is tied up to energy absorption by acetylene in the lower wavelengths range (220-250 nm). Also, a combined adsorption-photochemical process, related to precursors and submicron carbon particles, could be responsible for the yield increase observed at 5400 K (45%), around 365.0 nm. (Author abstract) 13 refs.

## Explosions

**086251 BLEVE: THE PROPANE CYLINDER.** Over the past two decades, there has been a dramatic increase in the use of small, portable cylinders of liquefied petroleum gases at home and at the workplace. These 20-pound cylinders—generally propane or butane—are used

for cooking, home repair torches, lighting, and heating. There also has been a dramatic increase in the number of firefighters killed and injured by explosions of small, portable propane cylinders. This report describes proper handling methods of propane cylinders during fires and BLEVE (boiling-liquid, expanding-vapor explosion).

Dunn, Vincent (New York Fire Dep, Manhattan, NY, USA). *Fire Eng* v 141 n 8 Aug 1988 p 63-65,67-70.

## Ignition

**086252 PROPANE OVER-FILLING FIRES.** The classic propane over-filling fire occurs in cold weather when a container is filled, then brought into a warmer environment. The container may be portable, used to supply heating fuel inside a building under construction, or it may be permanently attached to a recreational vehicle that is brought inside a heated garage to be serviced or parked. After the container has been in the warmer environment for some time, the high-pressure safety relief valve on the propane container opens, venting a large amount of propane which finds a convenient ignition source and ignites. The article examines how over-filling fires start. Tips are given to prevent over-fill fires. The article strongly suggests the need for following proper procedures for filling propane.

## Photochemical Reactions

**086253 ARYL CYCLOPROPANE PHOTOCHEMISTRY. UNUSUAL AROMATIC SUBSTITUENT EFFECTS ON THE PHOTOCHEMICAL REARRANGEMENT OF (2-ARYLCYCLOPROPYL)-METHYL ACETATES TO 1-ARYLHOMOALLYL ACETATES.** Irradiation of trans(2-arylcyclopropyl)-methyl acetates a 4-butenyl-1-arylacetate (7a,b,d-h) via an ionic mechanism from the singlet state. Similar rearrangements occurred with exo-(1,1a,6,6a-tetrahydrocyclopropyl)inden-1-yl)methyl acetate and the 4-cyano derivative. Excited state reaction rate constants were determined from reactant fluorescence lifetimes and product quantum yields. It is concluded that the rate-determining step involves conversion of the initially formed aromatic excited state to a reactive cyclopropane excited state and that cyclopropane to aromatic ring charge transfer enhances this process. (Edited author abstract) 26 refs.

## Processing

**086254 ROLE OF GALLIUM SPECIES ON THE DEHYDROCYCLODIMERIZATION OF PROPANE ON ZSM5 CATALYSTS.** The transformation of propane was carried out in a flow reactor. The conversion of propane on HZSM5 (0.2 g) is twice as high as on gallium oxide (0.2 g). It is slightly higher on the equal-mass mixture of HZSM5 and gallium oxide (0.4 g) than on HZSM5 (0.2 g). On gallium oxide, the products of propane transformation are essentially composed of propene (70 wt.%) and of an equimolar mixture of  $C_2$ , mostly olefinic (> 90%), and of  $C_1$ . The results obtained with the mixture of  $\text{Ga}_2\text{O}_3$  and HZSM5 show the transformation of propane on  $\text{GaHZSM5}$  is a reaction of bifunctional catalysis as is the hydroisomerization and hydrocracking of alkanes on Pt zeolites r the dehydrocyclodimerization of propane on  $\text{PtHZSM5}$  or on  $\text{PtAl}_2\text{O}_3$ . 12 refs.

## Production

**086255 DETERMINATION OF OPTIMAL CONDITIONS FOR OBTAINING 1, 3-DIMETHOXY-1-PHENYLPROPANE BY ADDITION OF METHYLAL TO STYRENE.** In this work the reaction of styrene with methylal was investigated in order to gain insight into the reaction and determine the conditions for obtaining acceptable yields of 1, 3-dimethoxy-1-phenylpropane. In a previous work boron trifluoride was recommended as catalyst of the reaction. However the necessity of working at low temperatures or under pressure makes this catalyst inconvenient for quantitative syntheses. Investigation of the influence of the styrene:methylal ratio at fixed styrene concentration of 0.8 and catalyst concentration of 0.2 mole/liter showed that with increase of the ratio from 1:2 to 1:10 conversion of styrene decreases from 95 to 54% in 1 h, while the selectivity of the reaction increases from 80 to 95.5%. A styrene:methylal ratio of 1:5 can be considered as close to optimal. The study of the influence of catalyst concentration on reaction of methylal with styrene showed that with change of catalyst concentration from 0.2 to 0.8 mole/liter the ratio rate significantly increases. Investigation also indicates that boron trifluoride etherate catalysts are the most effective of all those investigated. 11 refs.

**Pyrolysis** See Also CARBON—Microstructure; HYDROCARBONS—Pyrolysis.

**086256 SURFACE EFFECTS DURING THE PROPANE PYROLYSIS.** With equipment specially designed and assembled for studying coke deposition in pyrolysis of hydrocarbons, the surface effects on the product distribution and on the tendency for coke formation during propane pyrolysis were studied. Experiments were carried out in which (a) the material of the reactor tube was kept unchanged and the formation of coke was measured on small cylinders pretreated by different methods and (b) the material of the reactor tube was varied or treated by different methods and coke formation was measured on a small cylinder of the same material. The rate of coke deposition or even the property of the coke formed on the surface can be changed significantly depending on the material of the reactor and pretreatment of the surface. The physical and chemical properties of the reactor surface not only influence the coke deposition but also remarkably affect the gas phase product distribution. (Edited author abstract) In Chinese. 9 refs.

**086257 KINETIC STUDY OF COKE DEPOSITION DURING PROPANE PYROLYSIS.** On the equipment designed and assembled by the authors, the mechanism and kinetics of the coke deposition during propane pyrolysis were studied under the temperature of 800 approximately 900°C and residence time of 0.1 approximately 1.5 s. The experiment results showed that both the initial and asymptotic rate of coke deposition increased with the temperature and residence time in the range of the said conditions. Since high temperature and long residence time result in more coke precursor formation and high surface rate, more coke is formed. According to the results obtained, a mechanism of coke deposition was proposed. (Edited author abstract) In Chinese. 10 refs.

Liu, Huicai (Hebei Inst of Technology, China); Lou, Qiangkun; Zou, Renjun. *Shiyou Xuebao Shiyou Huagong* v 3 n 2 Jun 1987 p 21-28.

**086258 STUDY OF KINETIC MODELS FOR THE PYROLYSIS REACTION OF PROPANE.** The pyrolysis reaction of propane was studied using a pulsed micro-reactor system with on-line chromatography, at 700-825°C and atmospheric pressure with chromatographically pure propane and high-purity nitrogen as reactant and diluent respectively, at propane: nitrogen

dilution ratios of 0.49, 0.9 and 1.9. A simplified kinetic model is presented. Marquardt's algorithm was used to estimate all the kinetic parameters in the model. The concentration of each species in the reaction system calculated using the model are close to the experimental values. (Author abstract) 13 refs.

**Recovery** See Also GAS CONDENSATE—Processing; NATURAL GAS, LIQUEFIED.

**086259 PROPANE RECOVERY: THE RYAN/HOLMES PROCESS.** The Alford South Unit of Mitchell Energy Company is the first gas plant utilizing the Ryan Holmes process to recover propane and higher hydrocarbons from the gas production of a CO<sub>2</sub> flood enhanced Oil Recovery project. The plant produces a CO<sub>2</sub> product suitable for reinjection into area reservoirs and recovers both natural gas liquids and gas for sales or use as fuel. Plant construction was approved on May 25, 1985 and was mechanically completed on January 31, 1986. The plant was not brought on line until March 10, 1986 due to an insufficient volume of fuel gas for startup. 6 refs.

## Removal

**086260 PROPANE REMOVAL FROM PROPANE-AIR MIXTURES BY SOIL BEDS.** Dilute concentrations of hydrocarbons are difficult and expensive to remove from air by conventional scrubbing methods. Propane removal from propane-air mixtures by soil beds were measured in laboratory experiments and in an industrial application. In closed containers in the laboratory, the time to reduce the initial 1-3 percent propane concentration by half was 5 to 20 hours for soils at pH 6-8, moderate moisture contents, and temperatures  $\geq 15^\circ\text{C}$ . The propane removal rate was slower when the soil was air dry at 2°C temperature, or was pH 5.3. A test soil bed continuously removed 92-98 percent of the propane from an input air stream containing 0.6-1 percent propane. (Author abstract) 13 refs.

## Solubility

**086261 SOLUBILIZATION OF PROPANE BY MIXED MICELLES COMPOSED OF SODIUM ALKYL SULFATES.** This paper examines the role played by mixed micelles in gas solubilization and reports results obtained from a series of experiments in which the solubility of one gas, propane, is determined in aqueous solutions containing sodium dodecyl sulfate (SDS) mixed with either sodium octyl sulfate (SOS) or sodium hexyl sulfate (SHS) in various fixed proportions. High concentrations of sodium chloride are maintained in these solutions in order to suppress the critical micelle concentration (CMC) values for the various surfactant mixtures, thus allowing the onset of gas solubilization to be observed at lower surfactant concentrations. 7 refs.

**086263 COMBUSTION OF A NON-MOVING DROPLET: NUMERICAL STUDY OF THE INFLUENCE OF THE ASSUMPTIONS LEADING TO THE 'D<sup>2</sup> LAW'.** In most reactive flow calculations requiring a droplet combustion model, a quasi-steady analytical model is used leading to the D<sup>2</sup> law. This model is based on assumptions that are sometimes open to doubt, in particular when the pressure is high. In this paper, a numerical model of the combustion of a nonmoving droplet is presented which is free of the assumptions of the D<sup>2</sup> law. This model, based on the numerical solution of unsteady balance equations, uses an entirely implicit method of finite volumes. Each of the assumptions of the D<sup>2</sup> law has been studied successively, using the numerical model and comparing it with the quasi-steady model, in order to evaluate their influence. Among other things, it was found that the D<sup>2</sup> law becomes erroneous when the combustible droplet decomposes before reacting with the oxidizer; what is more, unsteady effects prove to be substantial at high pressure. (Edited author abstract) 7 refs.

Scherrer, D. (ONERA). *Rech Aerosp (Engl Ed)* n 5 1985 p 25-37.

**086264 AEROTHERMOCHEMICAL STUDIES OF ENERGETIC LIQUID MATERIALS: 1. COMBUSTION OF HAN-BASED LIQUID GUN PROPELLANTS UNDER ATMOSPHERIC PRESSURE.** The gasification and microexplosion characteristics of droplet of liquid gun propellants under atmospheric pressure have been experimentally investigated. Results show that the propellant explosion temperature is around 200°C and is substantially in excess of previously reported values. The droplet surface regression rate prior to the onset of microexplosion is found to be close to that of water and therefore is insensitive to the water content in the propellant as well as the oxygen concentration in the hot environment; these results demonstrate the dominance of water in the gasification process. It has also been determined that the propellant density attains a critical value of about 1.5 g/cm<sup>3</sup> at the state of microexplosion. (Author abstract) 6 refs.

**086265 IGNITION AND COMBUSTION OF PROPELLANT IN A RADIATING GAS FLOW.** In an opaque fuel, in which heat transfer occurs only by heat conduction, the radiant component can be taken into account by the introduction of an effective heat exchange factor. The effects noted are investigated theoretically in an example of the ignition of a gasified double-base propellant. The problem is examined within the framework of a model combining the representations of the thermal theory of ignition and the phenomenological theory of nonstationary combustion under irradiation. 12 refs.

Assovskii, I.G.; Zakirov, Z.G.; Leipunskii, O.I. *Combust Explos Shock Waves* v 22 n 6 Nov-Dec 1986 p 658-664.

**086266 MECHANISM OF COMBUSTION OF CATALYZED DOUBLE BASE PROPELLANTS.** Existing combustion models, namely, photo chemical theory, chelate and  $\pi$ -complex theory, and free radical mechanism and carbon/carbonaceous matter formation theory, for catalyzed double base propellants have been evaluated in the light of the experimental findings of the present study. Results obtained suggest that carbon formation and its availability to catalyze the reactions in foam and fizz zones are the probable cause of catalysis and platonization. It seems that both these phenomena (catalysis/platonization) are dependent on the C/NO ratio. So long as this ratio is above unity, the catalytic effect is observed, followed by the plateau effect, where this ratio is changed to unity. Ultimately, when the C/NO ratio is reduced to less than one, the burning rate falls and the postplateau effect is obtained. (Author abstract) 32 refs.

Singh, Haridwar (Explosive Research & Development Lab, Poona, India); Rao, K.R.K. *Combust Flame* v 71 n 2 Feb 1988 p 205-213.

**086267 APPLICATION OF THE DIFFUSIONAL COMBUSTION MODEL TO THE CALCULATION OF SUPERSONIC TURBULENT REACTING JETS.** In the present work, the influence of turbulence on the occurrence of chemical reactions is calculated using a modification of the method of the probability-density functional: the method of a conservative scalar quantity. The same approach was used in investigating the subsonic reacting jets in a covaleting flow and in a channel and supersonic flows in a channel. 12 refs.

**086268 FORMULATION EFFECTS ON THE BURNING RATE OF ALUMINIZED SOLID PROPELLANTS.** Porous ammonium perchlorate was prepared by a fluidization process at 230°C, the product of which was used as a partial substitute for crystalline ammonium perchlorate in composite solid propellants. Fourteen aluminumized propellants were divided into five groups containing various promoters (modifiers) having different burning rates in order to compare the effects of aluminum powder particle size on the burning rates of the propellants. Aluminum powders having three particle sizes (6-9, 16-19, and 60µm) were used. The burning rate was measured in a strand burner at 30, 50, 70, 100, and 150 atm of nitrogen pressure. The burning rates of propellants containing catocene or n-butylferrocene as a promoter increased with decreasing aluminum particle size. When copper chromite and/or ferric oxide was used as a promoter, the particle size of aluminum had no effect on the burning rate of the propellant. Therefore, the effect of aluminum particle size on the burning rate depends on the burning rate modifier in the propellant. (Author abstract) 8 refs.

**086269 DC ARC DISCHARGE IGNITION AND COMBUSTION CONTROL OF SOLID PROPELLANTS.** The feasibility of ignition and combustion control of solid propellants by dc arc discharge was empirically examined. In this experiment Al/Teflon composite propellants and a conventional HTPB/AP/Al composite propellant were studied. It was shown that the dc arc discharge coupled with a high-frequency-discharge arc initiator works as an efficient ignition method for solid propellants; that, for Al/Teflon propellants with appropriate O/F ratios, repeated ignitions and extinctions are possible by applying and interrupting the arc discharge; and that, for all the propellants tested, burning rates can be varied with the discharge intensity, although there exists a threshold current below which no effect on the burning rate is observed. (Edited author abstract) 10 refs.

**086270 COMBUSTION OF MAGNESIUM/POLYTETRAFLUOROETHYLENE.** The combustion of magnesium (Mg) with polytetrafluoroethylene (TF) is a complex oxidation reaction accomplished by physical changes from solid to liquid and to gas. The burning rate characteristics were determined with Mg/TF propellant pellets made of various-sized Mg particles and different mixture ratios of Mg/TF. The adiabatic flame temperature of Mg/TF propellants is the maximum when the weight fraction of Mg particles ( $\xi$ ) is 0.33. However, the experimental results indicate that the burning rate increases with increasing  $\xi$  for the propellants tested ( $\xi=0.2-0.7$ ), which shows that the burning rate does not depend on the final flame temperature. **086271 THEORETICAL INVESTIGATION IN STEADY STATE AND EROSION BURNING OF SOLID COMPOSITE PROPELLANTS.** The BDP steady burning model is revised in this paper and the revised BDP model is used in the prediction of steady burning rates of composite propellants. Based on the revised BDP model and turbulent flow theory a model for erosive burning is proposed. When the propellant compositions, chamber pressure and gas-dynamic conditions are given, these models can be used in the prediction of steady state and erosive burning rates. **086272 COMBUSTION OF HAN-BASED LIQUID MONOPROPELLANTS NEAR THE THERMODYNAMIC CRITICAL POINT.** The high-pressure combustion properties of liquid monopropellants involving mixtures of hydroxyl ammonium nitrate (HAN), triethanol ammonium nitrate (TEAN), and water are considered theoretically. Liquid surface properties and the critical combustion pressure (the pressure required for the propellant surface to exceed its thermodynamic critical point) were found allowing for real-gas phenomena and the presence of dissolved combustion product gases in the liquid. Critical combustion pressures for the HAN-based monopropellants were found to be unusually high, ca. 2500 atm, with an estimated uncertainty of 50 percent. Predictions were unusually sensitive to the critical temperature of TEAN and the binary interaction parameter between TEAN and water. (Edited author abstract). 32 Refs.

**Diffusion**

**086273 NON-FICKIAN DIFFUSION OF DETERENTS INTO A NITROCELLULOSE-BASED PROPELLANT.** The diffusion of solutions of ethyl centralite (EC), dibutylphthalate (DBP), and dinitrotoluene (DNT) into a nitrocellulose (NC) propellant is investigated. DBP and EC penetrate the propellant in a way consistent with Case II diffusion. The diffusion of DNT solutions is Fickian. The apparent activation energy for Case II diffusion is 62 kJ/mol for DBP and 66 kJ/mol for EC. Changes to coating solvent polarity have little effect on DNT and DBP penetration and merely alter the rate, not the mechanism, of EC diffusion into the propellant. (Author abstract) 20 refs.

**Extrusion**

**086274 EXTRUSION STRESSES, DIE SWELL, AND VISCOUS HEATING EFFECTS IN DOUBLE-BASE PROPELLANTS.** A capillary extrusion rheometer was used to evaluate the flow behavior of mixtures of nitrocellulose (12.2% nitrogen) and nitroglycerine when processed using solvent blends of different strengths. The aim of the work was to quantify the effects on flow behavior of 'gelatinization,' that is, the degree of breakdown of the fibrous structure of the nitrocellulose. The flow behavior was measured over a range of extrusion temperatures. The results indicate that the materials behave as Herschel-Bulkley fluids, that the shear stress decreases as gelatinization increases, and that viscous heating is more apparent in poorly gelatinized doughs. Surface temperatures of the extrudate determined experimentally are compared with computer-modelled values. Die swell measurements decreased with decreasing degree of gelatinization and with increasing extrusion temperature. (Author abstract) 15 refs.

**Heat Transfer**

**086275 MODELING OF HOT FRAGMENT CONDUCTIVE IGNITION OF SOLID PROPELLANTS WITH APPLICATIONS TO MELTING AND EVAPORATION OF SOLIDS.** A comprehensive theoretical model has been formulated for studying the degree of vulnerability of various solid propellants being heated by hot spall fragments. The model simulates the hot fragment conductive ignition (HFCI) processes caused by direct contact of hot inert particles with solid propellant samples. The model describes the heat transfer and displacement of the hot particle, the generation of the melt (or foam) layer caused by the liquefaction, pyrolysis, and decomposition of the propellant, and the regression of the propellant as well as the time variation of its temperature distributions. To validate partially the theoretical model in the absence of the necessary chemical kinetic data, an ice melting and evaporation experiment was designed and conducted. **086276 LIQUID PROPELLANTS FOR ADVANCED GUN AMMUNITIONS.** With constant improvements, the conventional solid propellants for guns have almost reached their limit in performance. Liquid gun propellants are promising new comers capable of surpassing these performance limits and have numerous advantages over solid propellants. A method has been worked out to predict the internal ballistics of a liquid propellant gun and illustrated in a typical application. (Author abstract) 5 refs.

**086277 STUDIES ON SOME ASPECTS OF PROPELLANTS FOR IMPROVING THE PERFORMANCE OF TANK GUNS.** The main criterion, in the design of propellant charge for a tank gun, is to achieve the highest possible muzzle velocity for fin stabilized armor piercing discarding sabot (FSAPDS) projectiles. This ensures penetration through the toughest armor plates by the kinetic energy of the projectile. One of the solutions, is to increase the force constant of the propellant. Higher force constants from conventional double and triple base propellant compositions lead to prohibitive

linear rates of burning coefficients. ERDL has developed a high energy propellant based on RDX, with very high force constant and low linear rate of burning coefficient. The objective of the present paper is to discuss various aspects of the interior ballistics of the three types of propellants in question in 105 mm tank gun with FSAPDS ammunition. The study shows that only the solution with RDX base propellant is feasible for an increase of three per cent in muzzle velocity. (Author abstract) 6 refs.

**086278 INVESTIGATION OF THE COMBUSTION OF LIQUID GUN PROPELLANTS IN CLOSED CHAMBERS.** Closed-chamber tests on hydroxylammonium nitrate (HAN) based liquid monopropellants were performed on loading densities of about 0.2 g/cm<sup>3</sup>. The objective of the studies was to investigate the composition of the HAN-based liquid propellants under various conditions. Pressure and temperatures were measured for both neat and intentionally contaminated monopropellants. Contaminants tested were iron, copper, aluminum, and nickel at concentrations of about 100 ppm. The temperatures were determined using both thermocouples and specially designed temperature (emission) gages. The data illustrate the behavior of the liquid propellants during the decomposition phase. (Edited author abstract) 13 refs.

**086279 STUDIES ON HYPERGOLICITY OF SEVERAL LIQUID FUELS WITH FUMING NITRIC ACIDS AS OXIDIZERS.** Hypergolic or self-ignition delays of unsymmetrical dimethylhydrazine (UDMH) and several amine fuels, mixed with three fuming nitric acid oxidizers, have been determined, at room temperature, in a highly sensitive 'cup test' apparatus. Ignition delay (ID) variations have been studied as a function of the chemical structure of the fuel, oxidizer composition, and oxidizer-to-fuel ratio. Probable pre-ignition reactions and structure-hypergolicity correlations have been suggested. Some nonhypergolic hydrocarbons and petroleum fractions have been hypergolized by addition of UDMH, and ID variations have been studied with respect to UDMH content in fuel and catalytic additives (ammonium metavanadate, ammonium dichromate, and cuprous oxide) in a red fuming nitric acid oxidizer (RFNA). Increasing UDMH content improves the hypergolicity of fuels toward RFNA. (Edited author abstract) 20 refs.

**086280 EVALUATION OF METALLIZED PROPELLANTS BASED ON VEHICLE PERFORMANCE.** An analytical study was conducted to determine the improvements in vehicle performance possible by burning metals with conventional liquid bipropellants. These metallized propellants theoretically offer higher specific impulse, increased propellant density, and improved vehicle performance compared with conventional liquid bipropellants. Metals considered were beryllium, lithium, aluminum and iron. Liquid bipropellants were H<sub>2</sub>/O<sub>2</sub>, N<sub>2</sub>H<sub>4</sub>/N<sub>2</sub>O<sub>4</sub>, RP-1/O<sub>2</sub> and H<sub>2</sub>/F<sub>2</sub>. The results of thermochemical calculations and mission analysis calculations for liquid bipropellants metallized with beryllium, lithium, aluminum and iron are presented. Technology issues pertinent to metallized propellants are discussed. (Edited author abstract)

## Materials

**086282 PYROLYSIS STUDIES OF POLYMERIC MATERIALS USED AS BINDERS IN COMPOSITE PROPELLANTS: A REVIEW.** A review is presented of pyrolysis studies of polymeric materials (with the emphasis on polybutadiene-type polymers) which are used as binders in composite propellants. Where possible, the polymer pyrolysis characteristics are discussed in terms of their relevance to combustion studies of propellants containing these (or similar) polymers as binders. It is shown that binders should receive more attention in any study on composite propellant combustion - both physical and chemical properties may be important, although there is no way as yet to decide beforehand which one plays the larger role. (Edited author abstract) 37 refs.

## Measurements

**086283 IMPACT AND FRICTION SENSITIVITIES OF COMPOSITE MODIFIED DOUBLE BASE (CMDB) PROPELLANTS.** The impact and friction sensitivities of CMDB propellant ingredients, ingredient combinations and propellants both in the form of slurry and cured propellants have been measured. Among the ingredient combinations, desensitized nitroglycerine (DNG) and ammonium perchlorate (AP) gave the height of 50% explosion of 18.5 cm, followed by spheroidal nitrocellulose (SNC) and casting liquid (desensitized NG). Like SNC and DNG combinations, CMDB propellant slurry also gave a height of 50% explosion of 23 cm. As compared to double base (DB) and composite propellants (CP), CMDB propellants containing AP were found to be more impact sensitive. Among the various combinations, the mixtures of SNC and AP and that of SNC, AP and Al were highly friction sensitive (6.4-8.4 kg). (Author abstract) 10 refs.

## Pyrolysis

**086284 STUDIES ON THE PYROLYSIS OF COMPOSITE SOLID PROPELLANTS LEADING TO IGNITION.** Studies on pyrolysis leading to the ignition of polystyrene (PS)/ammonium perchlorate (AP), polyvinyl chloride (PVC)/AP and polyphenol formaldehyde (PPF)/AP propellants revealed that the activation energy for the ignition strongly depends upon the binder. Double base propellants exhibit an empirical relationship between the ignition delay ( $\tau$ ) and the oxidizer concentration; when the same solution is applied to composite solid propellants, the plot of  $\ln \tau$  vs  $\ln C$  ( $C$ =concentration, %) yields a straight line with a knee corresponding to 65-70 per cent AP, above which the dependence on  $\tau$  becomes less sensitive. **086285 COMBUSTION WAVE STRUCTURE OF AP COMPOSITE PROPELLANTS.** The combustion mechanism of ammonium perchlorate (AP) composite propellants was studied. The oxidizer-rich propellants tested were made with excess concentrations of AP particles. The pressure deflagration limit of the propellant decreases with an increase in the binder concentration. The combustion wave consists of two reaction regions, I and II: region I is the zone of the AP monopropellant flame, while region II is the zone of the diffusion flame. The heat flux feedback from the gas phase to the burning surface increases as the pressure increases, and the heat flux is responsible for the burning rate characteristics. (Edited author abstract) 7 refs.

**086286 ORGANIC FILLERS FOR SMOKELESS INSULATIONS OF DOUBLE-BASE PROPELLANTS.** The number of organic fillers for smokeless polyurethane insulations hitherto known is rather small. In this paper, two general formulas expanding the range of organic fillers are described. The first formula describes molecules with linear structures, while the second one describes those with cyclic structures. A common feature of the above-mentioned fillers is their high (N+O)/C ratio. (Edited author abstract) 9 refs.

Proebster, M. (Bayern-Chemie GmbH, Aschau, West Ger). *Propellants Explos Pyrotech* v 12 n 4 Aug 1987 p 141-142.

**086287 COMBUSTION PROCESS OF Mg/TF PYROTECHNICS.** The combustion process of pyrotechnics was studied in order to obtain information concerning the burning rate control parameters. The pyrotechnics tested were made of magnesium (Mg) and tetrafluoroethylene (TF). The burning rate measurements revealed that the burning rate of the Mg/TF propellants (pellet-shaped) increases with increasing weight fraction ( $\xi$ ) of Mg in the range of  $\xi > 0.33$ . Although the adiabatic flame temperature reaches a maximum at  $\xi = 0.33$ , the burning rate increases with decreasing flame temperature. The total burning surface area of the Mg particles embedded in the propellant mass plays an important role in the oxidation process in the gas phase just above the propellant burning surface. The heat flux feedback from the gas phase to the propellant burning surface increases with increasing  $\xi$ . Therefore, the burning rate increases as  $\xi$  increases. (Edited author abstract) 4 refs.

**086288 DETERMINATION OF DERIVATIVES OF DIPHENYLAMINE IN AUSTRALIAN GUN PROPELLANTS BY HIGH PERFORMANCE LIQUID CHROMATOGRAPHY.** A new high-performance liquid chromatography (HPLC) method has been developed for the quantitative analysis of diphenylamine and its N-nitroso- and C-nitro derivatives found in single-base gun propellants. Of the potential derivatives, only 2- and 4-nitrodiphenylamine, 2,2', 2,4'- and 4,4'-dinitrodiphenylamine, 2,2',4,4'-trinitro-diphenylamine, 2,2'-tetranitrodiphenylamine, N-nitrosodiphenylamine and 4-nitro-N-nitrosodiphenylamine were found in major amounts. Minor derivatives noted were: 2,4-dinitrodiphenylamine, 2-nitro-N-nitrosodiphenylamine, 2,4'- and 4,4'-dinitro-N-nitrosodiphenylamine. This HPLC method can be used to quantify all the major derivatives in a single chromatogram and importantly, can be used even in the presence of propellant additives dinitrotoluene, di(ethylhexyl) phthalate and dibutyl phthalate. This procedure

provides the most effective analysis of stabilizer in single-base propellants yet published. (Edited author abstract) 14 refs.

**086289 EROSION BURNING MODEL FOR COMPOSITE-PROPELLANT ROCKET MOTORS WITH LARGE LENGTH-TO-DIAMETER RATIOS.** An improved phenomenological heat transfer model is presented to describe erosive burning flow processes in composite solid-propellant rocket motors having propellant grains of large length-to-diameter ratios. This model is based on the concept of enhanced propellant burning due to cross-flow-increased convective heat transfer from the flame and core flow to the propellant surface, with individual chemical reactions included implicitly in this macroscopic (or lumped-parameter) approach. The new equations governing the erosive burning rate are in general not only free of experimental coefficients derived from rocket motor firing data, in contrast to most past phenomenological models, but also include all important effects on the burning rate from previous models (e.g., local flame and core-flow properties, local grain port diameter, Reynolds number, initial propellant temperature, propellant surface temperature, propellant surface roughness, and turbulent heat transfer coefficient). (Edited author abstract) 38 refs.

**086290 EXPERIMENTAL METHOD FOR  $J_{IC}$  COMPUTATION ON FRACTURE OF SOLID PROPELLANTS UNDER DYNAMIC LOADING CONDITIONS.** An experimental method is proposed for fracture characterization of solid propellants. Regarding nonlinear behavior of such material, investigation is restricted to high loading rate conditions and  $J_{IC}$  fracture criterion is computed. A tensile split Hopkinson bar device was set up and fitted to experiments up to strain rate of  $300 \text{ s}^{-1}$ . Axisymmetric samples of various crack length was tested allowing  $J_{IC}$  computation using J.A. Begley-J.D. Landes method. Results are then analyzed and special attention is given to validity of L.E.F.M. assumptions in this case. (Author abstract) 17 refs.

Abdelaziz, M. Nait; Nevire, R.; Pluvinaige, G. *Eng Fract Mech* v 28 n 4 1987 p 425-434.

**086291 TEMPERATURE SENSITIVITY OF BURNING RATE OF AMMONIUM PERCHLORATE PROPELLANTS.** The temperature sensitivity of the burning rate of ammonium perchlorate (AP) composite propellants was studied as a function of the AP particle size and a burning rate catalyst. A simplified temperature sensitivity model is presented in order to distinguish between the effects of the gas-phase and solid-phase reactions on the initial propellant temperature ( $T_0$ ). The temperature sensitivity is decreased by the addition of small-sized AP particles and/or 2,2-bis(ethylferrocenyl)propane. This is caused by the insensitivity of the burning surface temperature to  $T_0$ . Thus, the gas-phase reaction rate depends only slightly on  $T_0$ , and the temperature sensitivity decreases. (Edited author abstract) 10 refs.

Kubota, N. (Japan Defense Agency, Tachikawa, Jpn); Miyazaki, S. *Propellants Explos Pyrotech* v 12 n 6 Dec 1987 p 183-187.

**086292 COMBUSTION MECHANISM OF DOUBLE-BASE PROPELLANTS WITH LEAD BURNING RATE CATALYSTS.** On the basis of relevant experimental phenomena and results, which also include the results of nonpropellant combustion, basic reactions caused by lead burning rate catalysts in the combustion process and their approximate reaction temperatures are described. Owing to the presence of carbon on the burning surface, part of the NO is reduced to  $N_2$  after six reaction stages occurring with carbon instead of the reaction between NO and CO. As a result of changing the reduction sequence for NO, the burning rate increases as a result of an increase in the temperature gradient in the

fizz zone of the burning surface. The reactions between PbO and C and between PbO and CO prevent the burning rate from increasing by consuming carbon on the burning surface and ejecting carbon particles from this surface. The super-rate, plateau and mesa effects are perfectly explained with these reactions and the fundamentals of heat transfer. 35 refs.

**086293 PROPAGATION OF CONVECTIVE COMBUSTION IN TWO-PHASE SYSTEMS WITH LONGITUDINAL POROSITY AND TRANSITION INTO THE UNDERDRIVEN DETONATION REGIME.** In this paper a theoretical model is proposed for the nonstationary propagation of a convective flame front in porous solid fuel and in fuel with longitudinal channels, and the conditions for the appearance of convective combustion and the emergence of the process into a regime exhibiting the characteristics of pseudounderdriven (weak) detonation are studied. 19 refs.

Smirnov, N.N. *Combust Explos Shock Waves* v 23 n 3 May-Jun 1987 p 300-309.

**086294 EFFECT OF OXIDIZER-PARTICLE SIZE ON THE UNSTEADY-STATE COMBUSTION TIME OF A COMPOSITE SOLID FUEL DURING A PRESSURE DROP.** A rapid variation of pressure during the combustion of a composite solid fuel alters considerably the composition and temperature of the combustion products during the unsteady-state-combustion period. The time required to reach a new steady-state combustion regime following a sharp rise in pressure is proportional to the burnup time of a grain of oxidizer. We considered the dependence of the duration of the transition regime of combustion on the size of PCA crystals during a pressure drop. The results indicate that the time required to achieve steady-state combustion regime is proportional to the burnup time of a grain of oxidizer. 2 refs.

**086295 APPLICATION OF XPS AND SIMS TO THE STUDY OF COMBUSTION THEORY OF SOLID PROPELLANT.** In this paper the surface property of combustion catalyst (chromic oxide) is studied by XPS and SIMS, and its effect on the catalysis of AP is measured. It is evident that calcined chromic oxide enhances the combustion catalysis due to the change of surface property. 2 refs.

Ma, Qingyun; Yang, Ronjie. *Bingong Xuebao* n 4 Nov 1987 p 50-55.

**086296 THEORETICAL AND NUMERICAL STUDY OF RADIATIVE IGNITION AND DERADIATIVE EXTINCTION IN SOLID PROPELLANTS.** Time-dependent processes of solid propellant deflagration are modeled, and a numerical simulation of ignition and extinction is undertaken. Since the analytic theory of ignition is well developed, the authors rely on it to verify the ability of the numerical algorithm to track stiff, time-dependent features of an ignition event. The verification of their numerical method provides a degree of confidence for the subsequent study of deradiation, which is less well understood. An activation energy asymptotic theory for deradiation is developed, which predicts that an influx of radiation on the order of the steady heat release of the exothermic reaction will, at near term, extinguish the propellant. Beyond this, conduction processes inherited from the thermal profile at the instant of deradiation may, or may not, cause resumption of pyrolysis, and, presumably, the deflagration as a whole. The analytic theory ignores the subsequent impact of a possible gas-phase flame that is detached many conductive-diffusive lengths away from the gas/solid surface. (Edited author abstract) 12 refs.

**086297 KINETIC MECHANISM ON THERMAL DEGRADATION OF A NITRATE ESTER PROPELLANT.** The thermal degradation of a double-base propellant has been studied to elucidate the rate-determining steps and the kinetic mechanism in a wide range of temperatures (60 to 200°C) using a modified Taliani test, thermogravimetry (TG), and a temperature-varied Abel (TVA) test. The results indicate that the degradation process consists of two major reactions, homolysis and autocatalysis, depending on temperature and total pressure due to evolved gases. The activation energy for homolysis was found to be 35-37 kcal/mol from the Taliani and TVA tests, which falls in the range of the bond dissociation energy of the weakest RO-NO<sub>2</sub> bonds. The activation energy for autocatalysis was determined to be 46-49 kcal/mol from Taliani and TG methods. These values observed for the two key reactions are totally opposite to the values reported in the earlier literature. The temperature dependence of the reaction rates obtained in this study implies that homolysis is the rate-determining step in the lower temperature range, while autocatalysis is rate-determining in the higher temperature range. (Edited author abstract) 20 refs.

**086298 PROPERTIES OF 1,3,3,5,7,7-HEXANITRO-1,5-DIAZACYCLOOCTANE (HCO) AND ITS APPLICATION IN PROPELLANTS.** The properties of HCO and its application as a monopropellant are described. In comparison with MHX, it is also a high-energy explosive with high thermal stability and can be used as an oxidizer in solid rocket propellants. The theoretical specific impulse of HCO double base propellant systems was calculated and the burning rates and thermal stability of the propellants were experimentally determined. The propellants were prepared by a spray-casting process. As an oxidizer in solid rocket propellant, HCO shows better characteristics under certain circumstances compared with HMx. (Edited author abstract) 5 refs.

**086300 ACTIVE CONTROL OF SOLID PROPELLANT CONSUMPTION RATE BY FORCED CONE BURNING.** Cone-shaped burning surfaces are known to form around areas of enhanced burning rate in solid propellant. A concept for actively controlling solid propellant charge consumption rate is presented that utilizes these areas of enhanced burning rate. Active control of mass flow rate is obtained that can be independent of other ballistic requirements such as specific impulse. A geometric time-dependent model is used to analyze the transition between quasi-steady-state conical burning surfaces in an end-burning configuration. Some means of controlling the areas of enhanced burning rate are discussed. Experiments using single-core negative exponent charges verified the model. (Author abstract) 22 refs.

**086303 EFFECT OF ACCELERATION ON THE BURNING RATE OF HTPB COMPOSITE ALUMINIZED SOLID PROPELLANTS.** The objectives of this paper are twofold. First, it describes briefly the analytic and experimental results on the combustion of HTPB composite aluminumized solid propellants in acceleration fields. The test were conducted in the jet propulsion laboratory of Beijing Institute of Technology. The facility used is a centrifuge mounted rocket motor. The second objective is to discuss the problem of modelling in detail. The paper presents a model in the form of an exponential function which correlates the combustion process, properties of the propellant and the burning rate acceleration sensitivity of composite propellants. The calculated results are in good agreement with the experimental data for HTPB propellants at acceleration levels from 75g to 107g. It is thus seen that such models can be utilized for the prediction of solid rocket motor performance. (Author abstract) 6 refs. In Chinese.

**086304 VELOCITY-COUPLED RESPONSE FUNCTION OF COMPOSITE SOLID PROPELLANT.** An analytical method is presented which permits one to predict velocity-coupled response function of composite solid propellants. The present analytical method is characterized by consideration of the phase advance of the oscillating component of the flow within the flame zone with respect to that of external flow outside the boundary layer. According to the theory of laminar boundary layer in oscillating flow, when the external flow oscillates in its magnitude of velocity at small amplitude, a very thin layer of order of  $\sqrt{\nu/\omega}$  exists near the wall, which is usually called as 'viscous wave penetrating thickness.' In this layer the phase of the oscillating component will be different from that of external flow, because for the most of composite solid propellants, their flames are within this layer, the phase shift must be taken into consideration in the calculation of velocity-coupled response function. A numerical example shows that the phase shift between the flow in the flame zone and the main stream is almost of the same order as that induced in solid. It increases the imaginary part of velocity response function  $R_v^{(0)}$  to positive value in a wide range of frequency where it would be negative without considering this phase advance, resulting in an increased wave

growth constant. (Author abstract). 12 Refs.

**086305 DECOMPOSITION CHEMISTRY OF TAGN.** Triaminoguanidine nitrate (TAGN) is a unique energetic material which produces relatively low molecular weight combustion products. TAGN is characterized by the oxidizer fragment "HNO<sub>3</sub>" that an ionic bond in the molecular structure. In this study, various types of experiments were conducted in order to elucidate the physicochemical decomposition process of TAGN. The exothermic rapid reaction observed at the early stage of the decomposition is the process representing the nature of energetics of TAGN. This exothermic reaction occurs immediately after the endothermic phase change from solid to liquid. Since the weakest chemical bond existing in the TAGN molecule is the N-N bond (159 kJ/mol), the initial bond breakage should be that of the amino groups and the NH<sub>2</sub> radicals split off. The energy released by the dissociation of the NH<sub>2</sub> radicals (104.3 kJ/mol) is the heat produced at the early stage decomposition of TAGN. Thus, the burning rate of TAGN is considered to be dominated by the dissociation of the NH<sub>2</sub> radicals. (Edited author abstract). 2 Refs.

**086306 DEVELOPMENT OF SOLID PROPELLANT TECHNOLOGY IN INDIA.** High energy composite solid propellants have been developed, characterized and produced at the Vikram Sarabhai Space Center and at the Sriharikota Center in India. Exotic fuel binders such as HEF-20, Polyol and HTPB for these propellants were also developed in ISRO as part of the indigenization program. The Satellite Launch Vehicle-3 (SLV-3) conceived in the early seventies, was fitted with four stage motors filled with solid propellants. These facilities, including critical process equipment, have come up as a result of indigenization efforts. The SHAR Plant known as SPROB has been further augmented to produce large propellant grains to meet the needs of the Polar Satellite Launch Vehicle (PSLV). (Edited author abstract).

## Solids

**086308 RHEOLOGICAL ANALYSIS ON THE EXTRUSION PROCESS OF DB PROPELLANT GRAINS WITH EMBEDDED CONTINUOUS WIRES.** Various factors affecting the quality of DB propellant grains with embedded continuous wires processed in a screw extruder are analysed through rheological and mechanical analyses of matrices and wires during the process. Based on the analyses, an improved method for die design is suggested. With the improved die, DB propellant grains with embedded continuous coated wires have been produced in the screw extruder, and are found to be of good quality, meeting all the demands of

performance tests. (Edited author abstract) 3 refs. In Chinese.

## Stabilizers

**086309 LC/MS STUDIES OF ETHYL CENTRALITE STABILIZED PROPELLANTS.** Extracts of the stabilizer ethyl centralite and its derivatives in a series of aged gun and mortar propellants were investigated by combined high-performance liquid chromatography/mass spectrometry (LC/MS). The HPLC retention times and the chemical ionization mass spectra obtained allowed positive identification of several products and made it possible to construct concentration profiles as a function of aging time. These results are useful for implementation of modern methods into stability surveillance programs for gun and mortar propellants. (Author abstract). 9 Refs.

## Testing

**086310 CROSS-LINKED SLURRY CAST COMPOSITE MODIFIED DOUBLE BASE PROPELLANTS: MECHANICAL PROPERTIES.** Cross-linking of NC by TDI in slurry cast CMDB propellant enhanced TS by about 100 per cent. Coated AP with resorcinol, phloroglucinol, hexanetriol or silicone oil etc. along with cross-linking of NC raised TS from 18 - 30 kg/cm<sup>2</sup>. Inclusion of phloroglucinol and silicone oil gave increased burning rates. The probable mechanism of action of cross-linking and improvement of mechanical properties by coating of AP has been discussed. (Author abstract) 10 refs.

## Thermodynamics

**086311 ENERGETICS OF PROPELLANTS, FUELS AND EXPLOSIVES; A CHEMICAL VALENCE APPROACH.** A simple approach involving the chemical valences of the fuel and the oxidizer elements present in a combustible mixture is described to evaluate the energetics-related parameters of propellants, fuels and explosives. It simplifies the stoichiometric balancing of complex combustion equations, and provides an easy method of calculating the elemental stoichiometric coefficient. The method correctly predicts whether a mixture is fuel-lean, fuel-rich or stoichiometrically balanced combustible systems has been shown to be linearly dependent upon their total oxidizing (or reducing) valences. This relationship has been used successfully to evaluate the calorific value of fossil fuels. For fuel-rich explosives, a new valence-dependent parameter has been derived which is found to be related to properties such as detonation velocity, heat of explosion and impact sensitivity. (Edited author abstract) 22 refs.

## PROPELLERS

### Acoustic Wave Effects

**086312 ACOUSTIC INTERFERENCE OF COUNTER-ROTATION PROPELLERS.** The noise fields from the rotors of counter-rotating propellers having the same number of blades and angular frequency tend to cancel or reinforce each other depending on the relative phase of the two fields at the point of observation. Because of this, the total noise field at the blade passage frequency or harmonics forms a characteristic standing wave pattern. A general investigation of this acoustic interference phenomenon is carried out. Unlike previous works, the present analysis allows the front and the rear

rotor to have different blade geometry and loading. Further, the effect of forward flight is included. Numerical results indicate that at high subsonic cruise Mach number the acoustic interference pattern differs substantially from that at static condition. (Author abstract). 11 refs.

## Aerodynamics

**086313 WIND TUNNEL PERFORMANCE RESULTS OF AN AEROELASTICALLY SCALED 2/9 MODEL OF THE PTA FLIGHT TEST PROP-FAN.** High-speed wind tunnel aerodynamic performance tests of the SR-7A advanced Prop-Fan have been completed at the NASA Lewis Research Center in support of the Prop-Fan Test Assessment (PTA) flight test program. The 62.23 cm (24.5 in.) diameter adjustable-pitch aeroelastic model was tested at Mach numbers typical of climb and cruise (i.e., from 0.45 to 0.90) in the NASA Lewis 8- by 6-Foot Wind Tunnel. The SR-7A model was aeroelastically scaled to have the same structural characteristics as the 2.743 m (9 ft) diameter PTA flight test Prop-Fan. This Prop-Fan has eight blades and a cruise design operating condition of 0.80 Mach number, 10.66 km (35 000 ft) I.S.A. altitude, 243.8 m/s (800 ft/sec) tip speed and a high power loading of 256.85 kW/m<sup>2</sup> (32.0 shp/ft<sup>2</sup>). At the cruise design condition, the SR-7A Prop-Fan had a high measured net efficiency of 79.3 percent. Further, it showed good aerodynamic performance over a wide range of Mach numbers. (Edited author abstract) 8 refs.

**086314 NUMERICAL SIMULATION OF TRANSONIC PROPELLER FLOW USING A THREE-DIMENSIONAL SMALL DISTURBANCE CODE EMPLOYING NOVEL HELICAL COORDINATES.** This paper discusses the numerical simulation of three-dimensional transonic flow about propeller blades. The equations for the unsteady potential flow about propellers is given for an arbitrary coordinate system. From this the small disturbance form of the equation is derived for a new helical coordinate system. The new coordinate system is suited to propeller flow and allows cascade boundary conditions to be straightforwardly applied. A numerical scheme is employed which solves the steady flow as an asymptotic limit of unsteady flow. Solutions are presented for subsonic and transonic flow about a 5 percent thick bicircular arc blade of an eight-bladed cascade. (Edited author abstract) 8 refs.

Snyder, Aaron (NASA, Cleveland, OH, USA). *NASA Tech Memo* 89826 1987 20p.

**086315 NUMERICAL NAVIER-STOKES SOLUTIONS OF HIGH-SPEED PROPELLER FLOWS.** The search for improved fuel economy for subsonic aircraft has led to a renewed interest in propeller aerodynamics. The goal of this work has been to extend detailed viscous analysis of propeller flows into the high-speed regime. The calculations were made with a finite-difference solution of the compressible, axisymmetric (with swirl), Reynolds-averaged, turbulent Navier-Stokes equations. (Edited author abstract).

## Cavitation

**086316 ON THE MECHANISMS OF PROPELLER CAVITATION NOISE.** This thesis deals with generation mechanisms and scaling of the propeller cavitation noise, i.e., the noise generated at the implosion of the vapour-filled cavities, which usually appear in the water around an operating marine propeller. The governing equations for generation of noise by the collapse of a single spherical cavity are reviewed, and the approximations

later used for derivation of similarity principles and scaling relations are clearly related to the theory of inviscid compressible flow. To obtain information about the way in which violent collapses develop for the non-spherical cavities occurring at propellers, experiments were carried out with propellers as well as oscillating foils. By synchronizing recordings of noise signals with high speed filming the mechanisms governing the noise generation could be identified. Finally, investigations of the experimental technique for model testing in cavitation tunnels are discussed with respect to hydrodynamics, acoustics and signal processing, and a comparison of model and full-scale noise data is also presented. (Edited author abstract) 21 refs.

**086317 HYDRODYNAMIC DESIGN OF PROPELLERS WITH UNCONVENTIONAL GEOMETRY.** The paper defines tip fin propellers as propellers with large degrees of rake and skew in the tip region. To examine whether such propellers of unconventional geometry are more efficient than normal propellers, lifting line theory is applied with a curved lifting line. Criteria for maximum efficiency are established, by Blade Element Theory and by Munk's Displacement Theory, and calculations indicate that an increase in efficiency can be obtained for most propeller loadings. By a series of calculations, guidelines for design of tip fin propellers are presented. (Author abstract) 25 refs.

## Fatigue

**086319 RELIABILITY ANALYSIS OF PROPELLER BLADE FATIGUE FAILURE.** Fatigue strength of Ni-Al bronze, which is normally used as large size propeller material, was discussed both experimentally and analytically. P-S-N diagram of Ni-Al bronze was proposed from S-N curve and the same stress level fatigue test results of thirty specimens. By applying modified Miner's rule to P-S-N diagram and the alternating blade stress frequency distribution model, the fatigue strength of propeller blade at various non-failure probability was estimated. It was concluded that the blade stress of high speed ships in operation was a little higher than estimated fatigue strength at stress cycles of 10<sup>9</sup>. Furthermore the fatigue strength of notched specimens were examined experimentally and analytically. And the fatigue crack propagation probability was also discussed by Monte Carlo simulation under postulation of distribution functions for crack size, number of cracks, material constants and applied alternating blade stress. (Author abstract) In Japanese. 19 refs.

## Fluid Dynamics

**086320 PHASE SAMPLING IN THE ANALYSIS OF A PROPELLER WAKE.** A phase sampling procedure is used for the analysis of the non-steady, periodic flow field in the near wake of a marine propeller. This method allows to obtain a true ensemble averaging of the experimental measurements. The average is made over a large number of repeated experiments each of which is taken during a complete revolution of the propeller. The

measurements are carried out in a recirculating water tunnel with a two-channel laser Doppler velocimeter. The computer-aided evaluation of the experimental results visualizes the following characteristic features of the wake: (1) the vortex sheet developing from the trailing edge; (2) a sudden increase of the axial velocity in the core of the tip vortex; (3) a boundary layer effect near the shaft of the propeller. From the analysis of the direction of vortex rotation along the radial direction of the blade, it is possible to derive information on the working conditions of the propeller. (Author abstract) 4 refs.

**086321 EXPERIMENTAL AND NUMERICAL INVESTIGATION OF A PROPELLER WITH THREE-DIMENSIONAL INFLOW.** The goal is to study the three-dimensional (3-D) flow produced by a propeller operating in a 3-D approach flow representative of pusher-prop arrangements on aircraft or underwater vehicles. The research involves both numerical predictions and wind-tunnel experiments. The specific nonuniform inflow studied is generated by a varying mesh screen disk of one large-diameter mesh, one smaller-diameter mesh, and a 30-deg mesh wedge aligned with the tip of the wedge and the centers of the two circular screens matching. This inflow is similar to the wake behind a slender axisymmetric body with a slender planar appendage. The propeller has three blades, and is 'self-propelled' with respect to the drag of the screen disk. The testing is divided into two main parts. The first deals with propeller performance and the condition needed to reach a self-propelled mode. The second part is the measurement of the mean and turbulent flow downstream of the propeller for two axial locations,  $x/D = 0.025$  and 0.5. (Edited author abstract). 14 refs.

## Ice Problems

**086322 ANALYTICAL DETERMINATION OF PROPELLER PERFORMANCE DEGRADATION DUE TO ICE ACCRETION.** A computer code capable of computing the propeller performance for clean, glaze, or rime ice propeller configurations to determine the performance degradation resulting from a given icing encounter has been developed. The inviscid, incompressible flowfield at each specified propeller radial location is first computed using the Theodorsen method. A droplet trajectory computation then calculates the droplet impingement points and airfoil collection efficiency for each radial location. User-selectable empirical correlations are available for determining the aerodynamic penalties due to ice accretion. Propeller performance is finally computed using strip analysis for either the clean or iced propeller. In the iced mode, the thrust and torque coefficient equations are modified by the drag and lift coefficient increments due to obtain the appropriate iced values. Comparison with available experimental propeller icing data shows generally good agreement. (Edited author abstract) 11 refs.

**086323 NUMERICAL PREDICTION OF PROPELLER PERFORMANCE BY VORTEX LATTICE METHOD.** The vortex lattice methods of lifting line, and lifting surface with one and two layers of vortex elements have been developed to analyze the performance of propellers. Comparison of the predicted thrust and power coefficients for NACA 109622, NACA 6623-A, NACA 6623-D straight blade propellers and NACA 4-(4) (06)-057-45A swept blade propeller gives close prediction with the experimental results by using the appropriate vortex lattice method. Two dimensional airfoil drag data has been included in the deviation of the equations of

thrust and power coefficients. However, only a small improvement of the predicted results is observed. (Edited author abstract) 21 refs.

**086324 ADVANCED TURBOPROP NOISE PREDICTION BASED ON RECENT THEORETICAL RESULTS.** This paper is about the development of a high speed propeller noise prediction code at Langley Research Center. The code utilizes two recent acoustic formulations in the time domain for subsonic and supersonic sources. The selection of appropriate formulation is automatic in the code. The structure and capabilities of the code are discussed. Grid size study for accuracy and speed of execution on a computer is also presented. The code is tested against an earlier Langley code. Considerable increase in accuracy and speed of execution are observed. Some examples of noise prediction of a high speed propeller of which acoustic test data are available are given. A brisk evaluation of formulations used is given in Appendix 1. (Author abstract)

**086325 CRUISE NOISE OF THE 2/9TH SCALE MODEL OF THE LARGE-SCALE ADVANCED PROPPAN (LAP) PROPELLER, SR-7A.** Noise data on the Large-scale Advanced Propan (LAP) propeller model SR-7A were taken in the NASA Lewis Research Center 8- by 6-Foot Wind Tunnel. The maximum blade passing tone noise first rises with increasing helical tip Mach number to a peak level, then remains the same or decreases from its peak level when going to higher helical tip Mach numbers. This trend was observed for operation at both constant advance ratio and approximately equal thrust. This noise reduction or, leveling out at high helical tip mach numbers, points to the use of higher propeller tip speeds as a possible method to limit airplane cabin noise while maintaining high flight speed and efficiency. (Edited author abstract) 13 refs.

**086327 EXTENSION OF KIRCHHOFF'S FORMULA TO RADIATION FROM MOVING SURFACES.** Kirchhoff's formula for radiation from a closed surface has been used recently for prediction of the noise of high speed rotors and propellers. Because the closed surface on which the boundary data are prescribed in these cases is in motion, an extension of Kirchhoff's formula to this condition is required. In this paper such a formula, obtained originally by Morgans for the interior problem, is derived for regions exterior to surfaces moving at speeds below the wave propagation speed, by making use of some results of generalized function theory. It is shown that the usual Kirchhoff formula is a special case of the main result of the paper. The general result applies to a deformable surface. However, the special form it assumes for a rigid surface in motion is also noted. Some possible areas of

application of the formula to problems of current interest in aeroacoustics are discussed. (Author abstract). 14 Refs.

## Selection

**086328 HYDRODYNAMIC FEATURES OF THE NEW QE2 PROPULSION SYSTEM.** Ever since the completion in 1969, the QE2 has sailed the seas with two fixed pitch propellers each driven by John Brown-Pamet-rada steam turbines. These six bladed propellers were designed to operate with maximum efficiency at 60 mW (total) and 28.5 knots. Now a new propulsion package is installed which utilizes the most up-to-date hydrodynamic standards. With the additional installation of Grim Wheels, the total configuration is far ahead of its time.

**086329 GAS GAIN IN XENON + 2,3 DIMETHYL-2-BUTENE FILLED PROPORTIONAL COUNTERS.** The gas gain in xenon-filled proportional counters can be greatly increased by the addition of a small quantity of 2,3 dimethyl-2-butene (DMB). We have found that a broad peak in gas gain appears when the concentration of additive is between approx. 0.4% and approx. 0.75% and the molecular number density of the gas filling is about  $2.7 \times 10^{25} \text{ m}^{-3}$  (approx. 1 atm). When the gas density is reduced to about  $1.4 \times 10^{25} \text{ m}^{-3}$  (approx. 0.5 atm) the peak becomes much sharper and better defined and reaches its maximum when the concentration of additive is approx. 0.43%. Lowering the density to approximately  $7.0 \times 10^{24} \text{ m}^{-3}$  (approx. 0.26 atm) results in a very sharp, well defined peak centered on an additive concentration of approx. 0.23%. The gas gains used to define these peaks were of the order of  $10^5$ , whilst in pure xenon at identical anode potentials the gas gain was of the order of 10. (Author abstract) 10 refs.

**086330 EXTENDED PARAMETRIZATION OF GAS AMPLIFICATION IN PROPORTIONAL WIRE CHAMBERS.** It is normally assumed that the gas amplification in proportional chambers is a function of Townsend's first ionization coefficient,  $\alpha$ , and that  $\alpha$  is a function of the anode surface electric field only. Experimental measurements are presented demonstrating the breakdown of the latter assumption for electric fields,  $X$ , greater than about 150 V/cm/Torr on the anode wire surface for a gas mixture of 80/20 argon/methane. For larger values of  $X$ , the parametrization of the proportional gas gain data requires an additional term related to the gradient of the electric field near the wire. This extended gain parametrization remains valid until the onset of nonproportional contributions such as positive ion space charge saturation effects. Furthermore, deviations of the data from this parametrization are used to measure the onset of these space charge effects. A simple scaling dependence of the gain data on the product of pressure and wire radius over the whole proportional range is also demonstrated. (Author abstract) 6 refs.

**086331 STACK OF TWO-DIMENSIONAL MULTI-WIRE PROPORTIONAL CHAMBERS AS PART OF AN ELECTROMAGNETIC CALORIMETER.** A set of four multiwire proportional chambers with analog readout were inserted in the calorimeter of the R704 experiment at the CERN ISR. In this experiment, charmonium ( $\psi$ ) resonances were directly formed through  $p\bar{p}$  annihilation. Owing to the high hadronic background, only electromagnetic final states ( $e^+e^-$  and  $\gamma\gamma$ ) were detected. Located near the maximum of the electromagnetic shower development, the stack of four chambers had as its main purpose a fine spatial localization, together with a good electron-hadron discrimination and multi-shower rejection in the critical few GeV region. (Author abstract) 7 refs.

**086334 MULTIELEMENT POSITION SENSITIVE PROPORTIONAL COUNTER FOR MEASUREMENT OF TRITIUM LABELED GAS MOVEMENT.** A multielement position sensitive proportional counter was developed for the measurement of  $^3\text{H}$  labeled gas movement in a pipe by internal counting. The counter consists of an outer cylindrical pipe with an inner diameter of 40 mm, seven resistive stainless steel anode wires with a diameter of 22  $\mu\text{m}$ , and 24 cathode wires with a diameter of 120  $\mu\text{m}$ . These wires divide the radial cross section of the pipe into seven regions. Since each region independently works as a position sensitive proportional counter and the seven resistive anode wires are connected in series through lump resistors, the region and the axial position where a  $\beta$ -decay event occurred can be known by a simple operation upon the charge signals obtained from two preamplifiers. (Edited author abstract) 20 refs.

**086336 TWO-DIMENSIONAL BEAM IMAGE MONITOR.** In this letter we describe a device useful in obtaining two-dimensional information from low intensity beams of ionizing radiation. It consists of an anode wire plane (to provide charge amplification), a gating plane (to control the flow of charge through the chamber), and a cathode plane for collecting charge. With a prototype chamber we have obtained 1 mm × 1 mm resolution with 48 × 48 pixels, and a sensitivity to single 6 keV X-ray events. (Author abstract) 1 refs.

**086337 GAS AMPLIFICATION FACTOR IN NEON-NITROGEN FILLED PROPORTIONAL COUNTERS.** The gas amplification factor in a cylindrical proportional counter filled with Ne-N<sub>2</sub> Penning mixtures has been measured (over the range  $1 < A < 6.4 \times 10^3$ ) to verify the validity of the gas gain formulae of Rose and Korff, Khristov, Williams and Sara, Diethorn and Zastawny. This factor has been found to obey Zastawny's formula over the range of variables studied. The formula of Diethorn can be fitted only for small nitrogen concentrations (below  $5 \times 10^{-4}$ ). Constants appropriate to the Zastawny and Diethorn formulae have been determined over a wide range of N<sub>2</sub> concentrations from spectroscopically pure Ne up to 11.1% N<sub>2</sub>. (Author abstract) 18 Refs.

**086338 CHARGE DIVISION IN A SMALL PROPORTIONAL CHAMBER CONSTRUCTED WITH ALUMINIZED MYLAR TUBES.** A tracking detector composed of aluminumized mylar drift tubes is under development for the Fermilab experiment 760. A prototype chamber has been constructed. Results on the longitudinal coordinate determined by charge division are given. Spatial resolution values below 2 mm (rms) were found, corresponding to <1 percent of the chamber length. Results on chamber ageing are also discussed. (Author abstract) 13 Refs.

**086339 ENERGY RESPONSE OF BONNER SPHERES TO NEUTRONS IN PARALLEL BEAM AND POINT SOURCE GEOMETRIES.** The energy response of the multisphere system equipped with a <sup>3</sup>H proportional counter was calculated by means of the adjoint flux technique. Calculations were performed using the one-dimensional, discrete ordinate neutron transport code ANISN and the DLC47 cross section library. The effect of the angular distribution of the impinging neutrons in the so-called 'point source' geometry was studied. In current correction procedures, this effect is expressed only as a function of the ratio of the sphere radius and source-to-sphere distance. This study shows additional pronounced dependences on both neutron energy and sphere size. (Author abstract) 13 Refs.

**086341 CAPACITIVE CHARGE DIVISION IN CENTROID FINDING CATHODE READOUTS IN MWPCS.** A technique is described in which the centroid of induced charge on cathode strips in a proportional chamber can be determined with reduced differential and integral nonlinearity, without increasing the number of readout channels. It is based on capacitive charge division from intermediate cathode strips to adjacent readout strips. It can be applied both to amplifier-per-channel systems and to global-position readout. Both types of readouts have been studied using this approach, which is easy to implement and does not require modification of the existing readout electronics. 11 refs.

**086342 RICH MWPC PAD READOUT BY USING CUSTOM MICROPLEX I.C.** The use of custom microplex integrated circuits to read out directly 10,800 of a multiwire proportional chamber based on a ring imaging Cerenkov (RICH) photon detector is described. Analog pedestal subtraction for every pad, digitization, sparsification, and hit list are done on the fly while serial analog data is being read from the microplex chips. The overall system uses less than 100 cables. Cost per channel for electronics and pads are \$4.00 and \$1.07, respectively. 6 refs.

**086343 WIRE CHAMBER AGING WITH CF<sub>4</sub>/ISOBUTANE AND ARGON/ETHANE MIXTURES.** The aging characteristics of CF<sub>4</sub>/isobutane (80:20) and argon/ethane (50:50) in identical test cells have been investigated. The gas gain and gas flow rate were varied and the measurements extended beyond 6 C/cm of wire. Study of a third gas mixture Ar/Eth/CF<sub>4</sub> (48:48:4) is at an early stage. The Ar/Eth mixture has shown a variety of problems including cathode foil etching, anode deposits, dark currents, and pulse-height degradation. In contrast the CF<sub>4</sub>/Iso mixture produced some cathode etching for low flow velocities and only very minor anode deposits. With very little pulse-height degradation or dark current this mixture is an considered excellent candidate for a high-rate chamber. A small-area multiwire proportional chamber using this mixture has been evaluated in a pion beam with particle fluxes up to  $3 \times 10^7$  particles/cm<sup>2</sup>-s. 5 refs.

**086344 CONSTRUCTION AND INITIAL OPERATION OF A PROPORTIONAL WIRE DETECTOR FOR USE IN A CERENKOV RING IMAGING SYSTEM.** The final version of the multiwire single-electron

detector for the Cerenkov ring imaging device of the Stanford Linear Collider Detector is described. Recent research-and-development efforts to define the design parameters are reported. These were concerned with computer simulations necessary for the detector design; wire aging and its solution; surface resistivity and voltage breakdown of G-10 in a TMAE environment; corona studies for various gases; wire breaking in the spark; measured mechanical characteristics of 7-μm carbon wires; wire-stretching technique for 7-μm carbon wires; and wire tension measuring for the final detector. The details of the geometry of the detector and experimental tests with the detector itself are discussed. 22 refs.

## Materials

**086350 STUDY OF THE EFFECT OF METHANE AND CARBON DIOXIDE CONCENTRATION ON GAS AMPLIFICATION IN ARGON BASED GAS MIXTURES.** Proportional counter gas amplification has been studied for argon based gas mixtures with methane and carbon dioxide as the quenching agent. Measurements of gas gain have been made using coaxial proportional tubes with different wire radii over a wide range of chamber voltages and pressures. The reduced gain function was found to be dependent on the reduced field  $E_0/P$ , and the fraction of the quenching minority gas, and approximately independent of the choice of quencher in most of the proportional region. The full data sample for the ten different gas mixtures can be described by a function with only nine parameters. (Edited author abstract). 8 Refs.

**086351 APPLICATION OF CONDUCTING-POLYMER THIN FILM FOR SOURCE MOUNT IN  $4\pi\beta$  COUNTING.** This film ( $\leq 30 \mu\text{g cm}^{-2}$ ) electrically-conducting polypyrrole polymer is shown to be a practical backing material for radioactive source intended for  $4\pi\beta$  proportional counting. In all essential respects the polypyrrole behaves similarly to VYNS but needs no metallizing to yield counting results of the sample accuracy as realized with conventional methods. There are some difficulties with shrinkage during drying and the resistance of the films increases with age but it remains sufficiently low for at least one year. 12 refs.

## Noise, Spurious Signal

**086354 APPLICATION OF THE PARTITION NOISE THEORY.** The operation of the wedge and strip position sensing element in three different types of detector (multichannel plate device, parallel plate proportional counter and multiwire proportional counter) is examined. It is shown that, unlike the two other detector types, the position resolution of a multiwire proportional counter cannot be affected by partition noise because its wedge and strip works from induced charge rather than collected charge. (Author abstract) 8 refs.

## Performance

**086355 NON-LINEARITY IN POSITION SENSING WITH CATHODE STRIPS OF A SINGLE WIRE PROPORTIONAL COUNTER.** The nonlinearity in the position readout from cathode strips has been investigated by a single-wire proportional counter using the charge-division method. The measured nonlinearities depended on the width of the cathode strip. This dependence agrees very well with theoretical predictions based on the formulae of E. Gatti et al. and J.S. Gordon and E. Mathieson. Obtainable position resolutions are independent of the strip width. (Author abstract) 12 refs.

## PROPULSION See Also AIRCRAFT ENGINES, JET AND TURBINE; CARS; FUEL CELLS—Research; ROCKETS AND MISSILES.

**086357 BOUNDARY-ELEMENT ANALYSIS OF FLAGELLAR PROPULSION.** The swimming of a flagellar micro-organism by the propagation of helical waves along its flagellum is analyzed by a boundary-element method. With regard to the flagellum, it is concluded that the optimum helical wave (amplitude  $\alpha$  and wave-number  $k$ ) has  $\alpha k \approx 1$  (pitch angle of 45°) and that for the optimum flagellar length  $L/\lambda = 10$  ( $L$  being the flagellar length,  $\lambda$  being the radius of the assumed spherical cell body) the optimum number of wavelengths  $N_\lambda$  is about 1.5. Furthermore there appears to be no optimal value for the flagellar radius  $a$ , with the thinner flagella being favored. These conclusions show excellent quantitative

agreement with those of slender-body theory. For the case of an ellipsoidal cell body, the optimum aspect ratios  $B/\lambda$  and  $C/\lambda$  of the ellipsoid are about 0.7 and 0.3 respectively;  $A$ ,  $B$  and  $C$  are the principal radii of the ellipsoid. (Edited author abstract) 20 refs.

**086358 ALTERNATIVE PROPULSION CONCEPTS USING HIGH-ENERGY BATTERIES AND HYDROGEN.** The role of electricity and hydrogen in vehicle propulsion, whether in a purely solar energy system or in a mixed nuclear/solar system, but at any rate in an extremely low pollution energy economy, could be outlined as follows. Advanced systems such as the sodium-sulphur battery offer the possibility of providing urban and short range transport (up to a range of 200 km). Larger distances of 200-500 km would have to be covered by using liquid hydrogen fuelled cars with internal combustion engines.

**086359 HYDROGEN SCRAMJET WITH SIDE WALL INJECTION.** This paper presents the results of some preliminary experiments on a wall injection scramjet performed in the free piston shock tunnel at the Australian National University. Several interesting features of this engine configuration were observed. Firstly, there is a region of cooled flow near the wall which cannot sustain combustion. This leads to a significant drop in performance compared to injectors mounted away from the wall. Secondly, a marked drop in the surface heat transfer rates was observed due to the film cooling effect of the cold fuel, and this might help to alleviate thermal protection problems on a flight vehicle. (Author abstract) 6 refs.

Morgan, R.G.; Paull, A.; Morris, N.A.; Stalker, R.J. *Trans Inst Eng Aust Multi Discip Eng* v Gell n 1 Apr 1987 p 45-51.

**086360 QUELQUES REMARQUES SUR LES SYSTEMES DE PROPULSION MULTIFONCTIONS OU 'COMBINES'.** [Remarks on Multifunction, or 'Combined' Propulsion Systems]. Much work is currently, devoted to complex systems for powering aircraft to hypervelocities, or even orbital aircraft. These are made of components insuring various functions and used (together or separately) at their optimal performance in each flight phase. The choice among variety of proposed solutions is difficult because of the various constraints of the mission. The studies made in the past and recent published results suggested some remarks concerning the classification of combined propulsion systems, their performance, and their choice. (Edited author abstract) In French.

Barrere, M. (Office Natl d'Etudes & de Recherches Aérospatiales, Chatillon, Fr). *Acta Astronaut* v 15 n 11 Nov 1987 p 931-935.

**086361 THRUSTER REQUIREMENTS AND CONCERNS FOR BI-PROPELLANT BLOWDOWN SYSTEMS.** Bi-propellant blowdown applications can involve a wide range of operating conditions and requirements for thrusters in the system. These requirements are determined by studies and analyses plus computer simulations of propulsion system operation. These studies, in conjunction with associated thruster testing, have resulted in the identification of significant areas of concern that should be addressed, including performance effects, chamber life, ignition spikes, and combustion stability. There are also potential duty cycle sensitivities, and successful operation in the steady-state mode does not guarantee acceptable

thermal control during pulsing modes. Testing should be conducted using realistic inlet conditions and duty cycles, and caution should be exercised in attempting to extrapolate into regions that have not been covered by actual testing. (Author abstract) 10 refs.

Hearn, H.C. (Lockheed Missiles & Space Co, Huntsville, AL, USA). *J Propul Power* v 4 n 1 Jan-Feb 1988 p 47-52.

**086362 GENERALIZED THEORY OF ROCKET PROPULSION FOR FUTURE SPACE TRAVEL.** This paper introduces a generalized theory of classical rocket propulsion for reusable space vehicles wherein the propellant is atmospheric gas and the propulsive decelerating or accelerating thrust is generated by, respectively, ingesting or expelling atmospheric gas at high velocities. The working fluid expelled during accelerating propulsive maneuvers is automatically replenished during decelerating propulsive maneuvers. The refueling retrothrust is generated by a large-diameter hypervelocity gas inlet diffuser mounted at the front of the vehicle, which ingests gas while traversing through the tenuous upper regions of a planet's atmosphere. (Edited author abstract) 18 refs.

Minovitch, Michael A. (Phaser Telepropulsion Inc, Los Angeles, CA, USA). *J Propul Power* v 3 n 4 Jul-Aug 1987 p 320-328.

**086363 LIFE-CYCLE-COST METHODOLOGY FOR THE SPACE STATION PROPULSION SYSTEM.** A life cycle cost (LCC) model was developed for the space station propulsion system, to support requirement and configuration trade studies. The model was conceived to be flexible in its structure in order to handle the large variations in propulsion concepts with regard to propellants, hardware, space station characteristics, and operational support schemes. The model categorizes LCC into four cost segments: development, production, transportation, and operational support. The methodology is described with regard to the model structure, assumptions and ground rules, types of cost estimating relationships used, validation, and input/output features. (Edited author abstract) 7 refs.

## Electric

**086365 WATER-PROPELLANT RESISTOJETS FOR MAN-TENDED PLATFORMS.** Space platforms are planned for the early 1990's which can be serviced by the Shuttle Orbiter, and at a later date, via the Space Station. Man-tended platforms are smaller than the manned Space Station and have significantly lower requirements for propulsion total impulse. Nonetheless, the basic requirements of integration with the Space Transportation System, altitude maintenance, reboost, attitude control, and collision avoidance must be met. The selection of a propulsion system for the man-tended platform has been influenced by the planned use of

resistojets for drag make-up on the manned Space Station. For this application, a resistojets has been designed that is capable of operation with a wide variety of propellants, including water. This paper discusses the reasons for selection of water as the propellant and the performance of resistojets using water, and describes the man-tended platform and its mission requirements. (Edited author abstract) 15 refs.

**086366 PRELIMINARY PERFORMANCE CHARACTERIZATIONS OF AN ENGINEERING MODEL MULTIPROPELLANT RESISTOJET FOR SPACE STATION APPLICATION.** This paper presents the results of a program to describe the operational characteristics of an engineering model multipropellant resistojets for application as an auxiliary propulsion system for a space station. Performance was measured on hydrogen, helium, methane, water (steam), nitrogen, air, argon, and carbon dioxide. Thrust levels ranged from 109 to 355 mN, power levels ranged from 167 to 506 W, and specific impulse values ranged from 93 to 385 sec, depending upon the propellant, chamber pressure, and heater current level selected. Detailed thermal maps of the heater and heat exchanger were also obtained for operation with carbon dioxide. (Author abstract) 16 refs.

Morren, W. Earl (NASA, Cleveland, OH, USA); Hay, Stuart S.; Haag, Thomas W.; Sovey, James S. *NASA Tech Memo* 100113 1987 22p.

**086367 NASA/USAF ARCJET RESEARCH AND TECHNOLOGY PROGRAM.** Direct-current arcjets have the potential to provide specific impulses > 500 sec with storable propellants, and > 1000 sec with hydrogen. This level of performance can provide significant benefits for such applications as orbit transfer, stationkeeping, orbit change, and maneuvering. The simplicity of the arcjet system and its elements of commonality with state-of-the-art resistojets systems offer a relatively low risk transition to these enhanced levels of performance for low power (0.5 to 1.5 kW) stationkeeping applications. Arcjets at power levels of 10 to 30 kW are potentially applicable to orbit transfer missions. Furthermore, with the anticipated development of space nuclear power systems, arcjets at greater than 100 kW may become attractive. This paper describes the ongoing NASA/USAF program and describes major recent accomplishments. (Author abstract) 40 refs.

**086369 REVIEW OF EUROPEAN ELECTRIC PROPULSION DEVELOPMENTS.** This paper presents the major activities carried out in Europe in the field of Electric Propulsion. Several lines of development, the

majority of which are sponsored by ESA, are being pursued. Three different models of the RIT family of radio-frequency ion thruster are being developed in Germany. In the United Kingdom, development was re-started in 1985 on a 10 cm diameter Kaufman thruster (UK10), derived directly from the former T5 thruster. In 1986 development of a scaled up version was initiated with a diameter of 25 cm (UK25). These engines, with thrust ranges of 10 and 200 mN respectively, have been extensively tested with Xenon propellant and are now undergoing further optimization for possible applications in secondary and primary propulsion. Tests and experiments on the Field Emission Electric Propulsion (FEPP) system are continuing, with attention now focused on a pulsed mode of operation which may open new applications for ultra-fine pointing and positioning of spacecraft. (Edited author abstract) 51 refs.

Bartoli, C. (ESA, Noordwijk, Neth); Berry, W. *J Br Interplanet Soc* v 41 n 4-5 Apr-May 1988 p 147-165.

**086370 UK LARGE DIAMETER ION THRUSTER FOR PRIMARY PROPULSION.** Previous work on electric propulsion systems within the UK has been concerned only with ion thrusters with thrust levels of a few tens of millinewtons, even though early planning assigned an orbit-raising function to the thruster. Recently, however, there has been renewed interest in the UK in the use of ion thrusters for orbit-raising of low Earth platforms, drag compensation of large spacecraft and general control and positioning tasks for future space systems. Also in Europe, there is increasing interest in high energy science missions. All these applications require thrust levels of a few hundred millinewtons. It was decided, therefore, to develop a 25 centimetre diameter Kaufman-type ion thruster, with a nominal thrust of 200 mN operating with xenon as propellant, for this class of application. The present paper describes the thruster design and initial test results. (Author abstract) 20 refs.

**086371 USE OF ELECTRIC PROPULSION ON LOW EARTH ORBIT SPACECRAFT.** This paper has considered the use of electric propulsion on low Earth orbit space platforms and in particular the application of such propulsion systems to the different elements of the NASA/International Space Station Program. Although the detailed definition and specification of the Space Station Elements is still in progress, it was possible to choose spacecraft which were thought to be sufficiently representative of each particular element for study and evaluation. 14 refs.

Martin, A.R. (UKAEA Culham Lab, Abingdon, Engl); Cresdee, M.T. *J Br Interplanet Soc* v 41 n 4-5 Apr-May 1988 p 175-182.

**086372 PERFORMANCE ASSESSMENT OF A UK RARE GAS ION THRUSTER.** During the years from 1967-77 the UK had a very successful programme of development for a 10 centimetre beam diameter mercury ion thruster. This work was discontinued in 1978, but as the market opportunities for such devices have improved since that date the development was restarted in 1985. Rare gas propellants rather than mercury are being used to avoid any spacecraft surface contamination problems. The performance of the UK thruster system in xenon has been found to be entirely satisfactory, and the operation appears to suffer no adverse effects from the propellant change. Performance has been mapped, both at the nominal 10 mN thrust level and at higher levels. The maximum thrust level achieved was 34.4 mN with a total power input of 930 W. This limit was set by the capability of the power supplies used to run the thruster itself. (Author abstract) 7 refs.

Martin, A.R. (UKAEA Culham Lab, Abingdon, Engl); Harvey, M.S.; Latham, P.M. *J Br Interplanet Soc* v 41 n 4-5 Apr-May 1988 p 183-192.

**086373 PLANS FOR AN IN-ORBIT TEST OF A UK RARE GAS ION THRUSTER.** As part of the development work on a UK rare gas ion thruster an exercise has been carried out to provide an initial assessment of the integration of such a thruster into a technology demonstrator satellite. The aim of the mission is to provide an in-orbit flight test of the thruster system, and to evaluate the effect of the thruster ion beam upon the spacecraft and upon the surrounding space plasma. Any interactions with communications links will also be assessed, to check that thruster operation and associated noise levels do not have any unacceptable effect upon the communications. (Author abstract) 6 refs.

**086374 FACTORS INFLUENCING THE INTEGRATION OF THE UK-10 ION THRUSTER SYSTEM WITH A SPACECRAFT.** The UK-10 ion thruster system is based closely on the 10 cm diameter T5 Kaufman-type thruster and its power conditioning and control system, which were developed during the 1970s for the North-South station-keeping application. The T5 device was designed to produce a thrust of 10 mN using mercury propellant. However, in the current work, mercury has been replaced by xenon to avoid any possibility of adverse chemical reactions with materials used in constructing spacecraft. In the previous phase of the programme, it was shown that the system was fully suitable for its intended mission and that its integration into a spacecraft should present no difficulties. This paper re-examines that conclusion, bearing in mind the different physical characteristics of the new propellant. It is confirmed that the UK-10 system, using xenon, is compatible with the requirements of a wide range of applications. (Author abstract) 31 refs.

**086375 RIT 35 RF-ION THRUSTER - DESIGN AND PERFORMANCE.** Within the basic research work on rf-ion thrusters, scaled-up versions of the standard RIT 10 engine, namely the RIT 15, RIT 20 and RIT 35 have been studied starting 1972. The tests on the RIT 35 have been carried out in 1986 until January 1987 with mercury as the propellant, demonstrating excellent operation data. Thus, a mass efficiency up to 89% and an electrical efficiency up to 84% could be proved. The minimum power-to-thrust ratio was 21.5 W/mN. Presently, the RIT 35 motor has been modified for inert gas operation using a new discharge vessel and a mass flow controller. The tests with xenon started in May 1987 using the flat grid system of the mercury tests which will be replaced by a dished grid system which has been manufactured by MBB, Munich. Then, the xenon performance data of the RIT 35 can be mapped completely. (Edited author abstract) 11 refs.

**086376 CATHODE PHENOMENA IN PLASMA THRUSTERS.** Processes at the arc cathode attachment decisively determine the entire discharge behavior of almost all arc devices and therefore also of MPD and/or arc jet thrusters. One well known process occurring on spotty arc attachments in a transverse magnetic field is the fact that the cathode spots move or jump in the direction opposite to the Lorentzian rule. In pulsed thruster devices with cold cathodes and very likely also in continuously running thrusters with so-called thermionic, seemingly diffuse attachments of hot surfaces, the arc attachment consists of many high current density spots. These spots can stick or spread upstream and thereby overheat the insulating material of the backplate of the thruster. In this paper an explanation of the phenomena of spot motion is presented. (Author abstract) 20 refs.

Auwater-Kurtz, M.; Kurtz, H.L. *J Br Interplanet Soc* v 41 n 4-5 Apr-May 1988 p 215-222.

**086377 EXPERIMENTAL MPD THRUSTER INVESTIGATIONS.** The experimental results presented are part of a greater effort to understand MPD propulsion and the related phenomena, which include theoretical investigations, both of the midstream flow field and electrodes and of erosion. The goal of the experiments is twofold: first to give a basis of data for the theories and second to come up with better and more efficient thruster designs, since the performances of self-field MPD thrusters, at least in the investigated power field < 500 kW, are quite modest. 19 refs.

Kurtz, H.L. (Univ Stuttgart, Stuttgart, West Ger); Auwater-Kurtz, M.; Merke, W.; Schrade, H.O. *J Br Interplanet Soc* v 41 n 4-5 Apr-May 1988 p 223-232.

**086378 COAXIAL NON-STEADY SOLID PROPELLANT MPD THRUSTER EXPERIMENTAL ANALYSIS.** A parametric experimental analysis of a coaxial non-steady solid propellant thruster has been carried out by varying the thruster geometry and the energy per shot. Their influence on the main working parameters and performance parameters has been determined. Thruster functioning is strongly affected by the ablation process. This process depends on the energy density which exists in the space adjacent to the ablation surface and, therefore, on coupling between the discharge and this surface. A field of -operating regularity- is defined by high values of the angle between the propellant surface and the normal surface to the thruster axis, by short cathodes, medium anodes, medium anode-to-cathode radius ratio and medium to high current. The current only depends weakly on the geometry. By increasing the energy per shot the current linearly increases and the performance parameters-impulse bit and thrust efficiency increase too. (Edited author abstract) 13 refs.

Paccani, G. (Univ degli Studi di Roma 'La Sapienza', Rome, Italy). *J Br Interplanet Soc* v 41 n 4-5 Apr-May 1988 p 233-240.

**086379 10kW STEADY-STATE MPD THRUSTER.** An experimental study on a 10 kW steady-state, direct-current MPD thruster has been made. A permanent magnet was used to supply an external field thereby reducing the thruster weight increase and eliminating the power requirements of a solenoidal coil. Magnet design was performed by numerical calculation with the intention of obtaining a field pattern similar to that produced by a solenoidal coil. Stable arc operation was obtained with the permanent magnet. This thruster delivered a specific impulse of 7700 sec and thrust efficiency of 25 percent with hydrogen propellant. Diagnostic measurements have clarified certain aspects of the plasma acceleration mechanism. It was found that the electromagnetic force related to the applied magnetic field is dominant for hydrogen propellant. The thrust production of this component was proved to be closely related to the current distribution in the plasma. (Author abstract). 19 Refs.

**086381 FIELD EMISSION ELECTRIC PROPULSION: EMISSION SITE DISTRIBUTION OF SLIT EMITTERS.** Research work on a slit-type field ion thruster for electric space propulsion is reported and discussed. Liquid-metal ion sources are used. A slit emitter with a closed propellant supply system was fired in any optional direction, requiring in principle no gravitational forces. Quantitative data relating the constituents of the residual gas atmosphere to the wetting behavior of the liquid-metal propellant and the emission-site distribution were obtained. A homogeneous distribution of equally spaced emission sites was observed; the measured spacing is in good agreement with a simple hydrostatic model of wavelike instabilities on electrically stressed surfaces of fluids. 13 refs.

**Laser Applications**

**086383 STRONG SHOCK WAVE SUPPORTED BY THE ABSORPTION OF LASER.** Basically, laser propulsion can be achieved either by a laser-supported combustion wave or by a laser-supported detonation wave as a mechanism for a propellant gas to absorb laser radiation. In this paper the structure of a laser-supported detonation wave is shown by solving one-dimensional gasdynamic equations, taking account of inverse bremsstrahlung absorption of the laser energy incident on the front shock wave. The structure of the detonation consists of (i) a shock wave heating the low-temperature nonabsorbing propellant gas up to a very high temperature, enabling it to absorb laser radiation, (ii) followed by a thick absorption region where the subsonic flow is accelerated by exothermicity to the sonic velocity. Virtually all the laser energy is utilized to raise the temperature of this region until an equilibrium state is established between the radiation at incident laser wavelength and the bremsstrahlung radiation emission from the heated gas. #### 086384 SPACE STATION PROPULSION SYSTEM TECHNOLOGY.

Two propulsion systems have been selected for the space station: O/H rockets for high thrust applications and the multipropellant resistojets for low thrust needs. These thruster systems integrate very well with the fluid systems on the station. Both thrusters will utilize waste fluids as their source of propellant. The O/H rocket will be fueled by electrolyzed water and the resistojets will use stored waste gases from the environmental control system and the various laboratories. This paper presents the results of experimental efforts with O/H and resistojets thrusters to determine their performance and life capability. (Author abstract) 18 refs.

## PROPYLENE

### Chemical Reactions

**086385 KINETICS OF THE  $\gamma$ -RADIATION-INITIATED REACTION OF 2-PROPANOL WITH TRI- AND HEXAFLUOROPROPYLENE.** The object of this work was to study the reactivity of trifluoropropylene (TFP) and hexafluoropropylene (HFP) with 2-propanol (IPA). From the experimental results it is evident that the rate constant for the addition of the  $\alpha$ -hydroxyisopropyl radical increases by a factor of  $2.6 \cdot 10^3$  when the hydrogen in propylene is completely replaced by fluorine. This is explained by a reduction of the electron density on the  $\beta$ -carbon atoms (relative to the  $\text{CF}_3$  group) as a result of the electron acceptor effect of the fluorine atoms. For this reason, and also because of the steric hindrance due to the  $\text{CF}_3$  group, the  $\alpha$ -hydroxyisopropyl radical, which has a nucleophilic character, adds to the  $\beta$ -carbon atom of trifluoropropylene. 5 refs.

### Oxidation

**086386 ROLE OF ZINC COMPLEXES AT THE ELEMENTARY STEPS OF THE RADICAL CHAIN CATALYTIC REACTION OF ISOPROPYLENE OXIDATION.** The authors studied the oxidizability of cumene (isopropylbenzene) in presence of monophenanthrolinezinc (II) pyrazolonate and monophenanthrolinezinc (II) acetate, which are catalysts found to have the highest activity in the oxidation reaction. The results of this study are presented in this communication. The oxidizability of cumene was estimated from the rate of initiated oxidation in a gasometric apparatus using azobisisobutyronitrile (AIBN) as the initiator. It was shown in special experiments that the rate of initiated oxidation of cumene at oxygen partial pressures of 400 GPa and higher is independent of the oxygen concentration in the system and on the frequency of shaking the reaction mass. Therefore chain termination occurs only upon recombination of peroxy radicals. Data on oxidizability of cumene in presence of the catalysts studied are given. Since zinc phenanthroline monoadducts do not influence the initiation step either, it can be said with certainty that the role of the catalytic systems studied lies in their active influence on degenerate branching.

#### 086387 THEORETICAL AB INITIO STUDY OF THE VINYL CARBENE-CuO COMPLEX: APPLICATION TO LAST STEP OF THE PROPYLENE PARTIAL OXIDATION MECHANISM ON $\text{Cu}_2\text{O}$ .

Using non-empirical pseudopotentials, we have performed a theoretical study on the last step of the propylene partial oxidation mechanism, the acrolein desorption from the catalyst surface. To represent the catalyst we have used a simplified model of a catalyst active site. We have studied the  $\text{C}_3\text{H}_4\text{CuO}$  complex, analyzing the dissociation process of the oxygenated complex from a metallic center. The results indicate that this complex dissociates into cis- and trans-acrolein and a metal site, in a process without energetic barrier. (Author abstract) 46 refs.

**086388 KINETICS OF THE OXIDATION OF PROPYLENE OVER A BISMUTH MOLYBDATE CATALYST.** Using statistical design procedures an initial-rate study of the oxidation of propylene over a silica-supported bismuth molybdate catalyst was carried out using a differential-bed reactor over the following range of conditions: temperatures from 350 to 390°C, oxygen and propylene concentrations from 1.0 to 8.0 mmol/L. Among the models considered a Redox Steady-State Model (with half-order oxygen concentration) involving oxygen adsorption and reaction with propylene from the gas phase was found to provide the best fit to the data. (Author abstract). 22 Refs.

**086389 MAGNESIUM CHLORIDE SUPPORTED HIGH-MILEAGE CATALYSTS FOR OLEFIN POLYMERIZATION. XVII. EFFECT OF LEWIS BASE ON PROPYLENE POLYMERIZATION.** A systematic study has been made on the functions of external Lewis base ( $\text{B}_2$ , methyl-p-toluate, MPT) and internal Lewis base ( $\text{B}_1$ , ethyl benzoate, EB) for the CW-catalyst system  $\text{MgCl}_2/\text{EB}/\text{PC}/\text{AlEt}_3/\text{TiCl}_4\text{-AlEt}_3/\text{MPT}$  (PC, p-resol).  $\text{B}_1$  is a nonstereoselective modifier. It increases the active site concentrations and rate constants of propagation of both the isospecific and nonspecific sites, and thus the productivities of the stereoregular and irregular polypropylenes by five- to tenfold. It seems that  $\text{B}_1$  complexes with the  $\text{MgCl}_2$  support to lower the electronegativity of the surface Mg atoms. It also acts to lower the rate constant of chain transfer to aluminum alkyl by two- to fourfold. The action of  $\text{B}_2$  is highly stereospecific. The isotacticity index of polypropylene is  $\geq 95\%$  in the presence of  $\text{B}_2$  but  $\leq 68\%$  without it. (Edited author abstract) 26 refs.

**086390 CATALYST FRAGMENTATION DURING PROPYLENE POLYMERIZATION: PART I. THE EFFECTS OF GRAIN SIZE AND STRUCTURE.** Fragmentation of support/catalyst particles during propylene polymerization in the gas phase is analyzed via a mathematical model including energy and mass transfer with chemical reaction processes. The rupture phenomenon is considered specifically by the model, and evaluated as it proceeds in time. Two different regions are recognized in the polymerizing particle at fragmentation time: an inner core resembling the original solid support/catalyst structure, and an external set of layers where most of the polymerization occurs. Model predictions concerning the effects of fragmentation on polymerization are discussed. (Edited author abstract) 21 refs.

Ferrero, Monica A. (CONICET, Santa Fe, Argent); Chiovetta, Mario G. *Polym Eng Sci* v 27 n 19 Oct 1987 p 1436-1447.

#### 086391 CATALYST FRAGMENTATION DURING PROPYLENE POLYMERIZATION: PART II. MI-

**CROPARTICLE DIFFUSION AND REACTION EFFECTS.** A mathematical model is used to predict the behavior of the support/catalyst/polymer macroparticle during the gas phase polymerization of propylene. The problem is focused on the micrograin level of the macroparticle, and the emphasis placed on the combined reaction and diffusion processes taking place in the macroparticle. Particular attention is given to the effect of the main geometry parameter, the size of the catalytic nucleus, on polymerization variables. Fragmentation rate, monomer concentration, and temperature are studied in terms of their dependence on the geometry-related dimensionless numbers typical of the process. The model suggests criteria for predicting 'a priori' the combination of reaction parameters that will produce a diffusion-limited reaction regime in the macroparticle. (Edited author abstract) 12 refs.

**086392 PROPENE OLIGOMERIZATION OVER SYNTHETIC MICA-MONTMORILLONITE (SMM) AND SMM INCORPORATING NICKEL, ZINC AND COBALT.** The activity and selectivity for propene oligomerization of pure synthetic mica-montmorillonite, SMM, as well as SMM incorporating various transition metals, was studied. The effect of incorporating nickel into the matrix as well as ion-exchanging (IX) nickel, zinc and cobalt into the interlayer spaces was investigated. Matrix nickel removed the long induction period characteristic of SMM and ion-exchanged SMM. Reducing the ion-exchanged nickel removed the induction period in the oligomerization reaction. Removal of the reduced nickel by carbon monoxide leaching caused an increase in activity. Water drastically decreased the catalyst lifetime. Zn(IX)SMM had a greater activity than Ni(IX)SMM, and Co(IX)SMM was initially more active than either but deactivated rapidly. Oligomerization selectivity was fairly constant throughout this study and the products were predominantly trimers and tetramers. (Edited author abstract). 14 Refs.

### Processing

**086393 SELECTIVITY STUDIES ON THE HYDROFORMYLATION OF PROPYLENE CATALYZED BY THE CLUSTER ANION  $[\text{HB Ru}_3(\text{CO})_11]^-$ .** The chemo- and regioselectivity of the hydroformylation of propylene catalyzed by  $[\text{NET}_4][\text{HRu}_3(\text{CO})_11]$  was studied as a function of solvent, temperature and pressure. The catalyst was found to be chemospecific, independent of the reaction conditions; exclusively aldehydes were formed, and no alcohols were detected in the mixture. The regioselectivity can be optimized by variation of the reaction conditions: In the best case, the n/i ratio of the butanals formed was a high as 98.6:1.4. In every case the catalyst remained unchanged in the solution. (Author abstract) 10 refs.

Suess-Fink, Georg (Univ Bayreuth, Bayreuth, West Ger); Schmidt, Gerhard F. *J Mol Catal* v 42 n 3 Nov 2 1987 p 361-366.

**086394 STUDY OF THE HYDROFORMYLATION OF PROPYLENE TRIMERS.** The authors previously studied the effect of solvent, olefin concentration, and temperature on the rate and selectivity of propylene trimer hydroformylation (oxo reaction). In this communication we report on the continuing investigation of the kinetic characteristics of this reaction. It is shown that the kinetic characteristics of olefin hydroformylation in the presence of the catalytic system cobalt carbonyls + Lewis bases are essentially identical to those obtained with the classical catalyst  $\text{HCo}(\text{CO})_4$ . However, in the present case two characteristic features were observed: a) a higher alcohol

yield (20-25% higher than obtained with the classical catalyst) and b) a significantly lower yield of high-boiling side products [4-6 vs 16-25% for  $\text{HCo}(\text{CO})_4$ ]. 8 refs.

## Pyrolysis

**086395 PYROLYSIS OF PROPYLENE OVER CARBON ACTIVE SITES II. PYROLYSIS PRODUCTS.** The pyrolysis of propylene over Graphon, a graphitized carbon black, was studied in the temperature range 873 to 1073 K at a starting pressure of 1.6 Pa. Using this substrate, the effect of the carbon active surface area (ASA) on the type, distribution, and mode of formation of the reaction products was investigated. On a clean surface, propylene instantly chemisorbed on some active sites at the beginning of each pyrolysis run and ultimately formed a more unsaturated hydrocarbon complex on the surface. Regardless of the cleanliness of the surface, a carbon deposit was formed on the surface. In the range 873 to 973 K, the major gas phase products consisted of methane, ethylene, and  $\text{H}_2$ . A model is proposed to explain the origin of all the pyrolysis products. (Edited author abstract). 29 Refs.

**086396 TWENTY YEARS OF NEUROLOGICAL PROSTHESIS-MAKING.** The UK Medical Research Council's Neurological Prosthesis Unit was formed on 1 October 1968. In this review, the author, who has been with the unit from the beginning, reflects on what seem to him to be the most important contributions to implant technology from the unit, and suggests some possible developments for the future. (Edited author abstract) 9 refs.

Donaldson, P.E.K. (MRC, London, Engl). *J Biomed Eng* v 9 n 4 Oct 1987 p 291-298.

**086397 EXTRACORPOREAL CIRCULATORY ASSIST DEVICES.** Extracorporeal circulatory assist devices have salvaged patients who could not be weaned from cardiopulmonary bypass, and most of these patients have returned to a useful and productive life. A variety of cannulation techniques and devices have been developed. Right or left ventricular assistance was provided with a centrifugal pump, and percutaneous veno-venous bypass was instituted with a centrifugal pump and a semiporous membrane oxygenator for patients with postoperative respiratory failure. The success of this system encouraged the authors to use veno-arterial bypass for either biventricular failure or a combination of cardiac and respiratory failure. This paper reports experiences with circulatory assist devices. Extracorporeal circulatory support provided a period for recovery from potentially reversible injury. It was found that single ventricular support produced the best chance of survival; veno-arterial bypass may provide short-term support until another system can be instituted. 15 refs.

**086398 INFECTIOUS COMPLICATIONS ASSOCIATED WITH VENTRICULAR ASSIST DEVICE**

**SUPPORT.** Mechanical circulatory support of patients in refractory cardiogenic shock has become commonplace since Spencer's initial success in 1965. The majority of devices are inserted as either bridges to cardiac transplantation or as interim circulatory support until myocardial recovery occurs. A significant number of patients die of related septic complications despite maintenance of adequate hemodynamics. This study was designed to determine the incidence and influence of septic complications on survival in patients supported with mechanical circulatory assist devices. 7 refs.

**086399 NEW RIGHT VENTRICULAR ASSIST DEVICE: THE EXTRACORPOREAL PULSATILE ASSIST DEVICE (EPAD).** This paper reports on a study to evaluate the short-term effectiveness of a low-cost, readily manufactured extracorporeal pulsatile assist device (EPAD) as a temporary right ventricular assist pump during acute pulmonary artery hypertension. The EPAD is designed to permit rapid open-chest cannulation of the PA to obtain vascular access, and no device components remain implanted following discontinuation of circulatory support. The EPAD was designed specifically as a temporary device. The EPAD was designed as a valveless device, a configuration that permits a simple, cost-effective pump design and does not require surgeons currently performing open-heart surgery to have specialized training to implant it. 17 refs.

**086400 RENAL FAILURE IN PATIENTS WITH VENTRICULAR ASSIST DEVICES.** In view of a lethal association of renal failure in patients undergoing cardiopulmonary bypass, the authors reviewed their experience with patients requiring the use of a Pierce-Donachy pneumatic ventricular assist device to determine if renal failure is a predictor of mortality. It is concluded that the appearance of renal failure in a patient supported with a pulsatile ventricular assist device or under consideration for placement of such a device portends a poor prognosis and thought must be given to alternative methods of treatment. 4 refs.

**086401 AUTOSTATIC ENDOURETHRAL PROSTHESIS FOR LONG-TERM MODELING-REPLACEMENT OF THE MALE URETHRA.** The device is an 'en bloc' molded silicone tube, 20 centimeters in length and of variable diameters from 18 to 22 F. Lateral orifices are situated at the upper part to ensure optimal urinary drainage. To prevent migration downward and upward, barbs are implanted laterally. The distal part is free of barbs and can be divided to adjust the prosthesis to individual urethral lengths. The device is an endoluminal tube, is expected to allow urethral modeling, and is autostatic, disposable, and interchangeable. The paper reports results of applying the prosthesis in 14 patients. 5 refs.

**086402 PIN TRACT INFECTIONS: A CANINE MODEL.** The purpose of this study was to examine three issues: the relationship between the length of time of skeletal pin insertion and bacterial infection, the connection between skin organisms and the intramedullary infecting agent, and the length of time necessary for the medullary canal to sterilize itself after pin removal.

Skeletal pins were inserted in a group of dogs, and a direct correlation was found between the duration of time that the pins remained in the bone and positive intramedullary cultures. The infecting agent in 88% of the medullary cultures was also cultured from the skin. In a second group of dogs, the pins remained in place for 1, 2, 3, or 4 weeks, respectively. The pins were removed, and the pin tracts were permitted to heal for varying periods of time. The medullary canals were then cultured. Study results are discussed. (Edited author abstract) 4 refs.

**086403 RESEARCH AND DEVELOPMENT OF ADVANCED BIO-COMPOSITE MATERIALS AND APPLICATION TO THE ARTIFICIAL HIP JOINT.** The object of the experiments was to discover the static and dynamic load-carrying capacity of a prosthetic system consisting of a Ti alloy stem, zirconia ceramic ball head and ultra-high molecular weight polyethylene socket molded in the ceramic shell, the latter two both 22 mm in diameter. The components of the artificial hip joint were placed in a vertical position and load was applied, alternating between 0 and 10kN and then 12kN with a frequency of 30Hz under Ringer's solution up to  $10^7$  cycles respectively. After  $2 \times 10^7$  cycles there was no sign of damage to be observed among the system tested using the joint simulator. This seems to be a very high safety factor compared with loads occurring in vivo. 2 refs.

**086404 EXTENT OF ARTIFICIAL LIMB USE FOLLOWING REHABILITATION.** The extent of prosthesis use is reported for 104 lower limb amputees from the onset of gait training up to 2 years later. Unilateral trans-tibial (UTT) amputees progressed more quickly during the inpatient gait training program than did unilateral trans-femoral (UTF) subjects. UTT subjects also walked more than UTF subjects just prior to discharge during the first year after discharge and during the second year after discharge. Similarly, younger patients progressed more quickly in gait training and walked more than older subjects throughout the study period. There were no significant interactions between age and amputation. At the time of discharge from the inpatient gait training program, older unilateral amputees and trans-femoral amputees were not able to walk the 600 steps a day necessary to manage with a moderate level of support in a one-level apartment or home. The declining number of steps taken in the follow-up period indicated that the UTF subjects might benefit from some special attention paid to their community support needs. Additional study results are discussed. (Edited author abstract) 14 refs.

**086405 DIGITAL ELECTRONIC CONTROLLER FOR ABOVE KNEE LEG PROSTHESES.** A digital electronic controller scheme has been proposed to control the angle at knee and ankle joints in above knee (A/K) lower extremity prostheses during locomotion. The control strategy is based on close scrutiny of locomotion in normal human beings. Laboratory testing of the proposed sequential network confirmed the uniqueness of the controller in providing signals to get desired state of prostheses at every stage during swing phase of walking. The use of such a controller would relieve handicapped subjects of awkwardness during walking and there will not be unnecessary stress on the remaining part of an amputated limb. If successful in field testing such a

controller can be mass-produced and would offer advantages of compactness, lightness and high efficiency. Apart from prosthetic devices the controller may find applications in robot arm movements. (Author abstract) 4 refs.

**086407 VOLUME CHANGES OCCURRING IN POSTOPERATIVE BELOW-KNEE RESIDUAL LIMBS.** Comparative maturation rates of 36 below-knee postoperative, healed amputation residual limbs were observed. Measured were the limb volumes and circumferences. Three methods of residual limb stabilization were employed: 1) elastic wrap; 2) plaster cast and pylon; and, 3) plastic laminate socket and pylon. The limbs receiving the plastic laminate showed the most rapid stabilization, while the elastic wrap did not stabilize. Considerable variance existed in relations between variables. Correlation between limb circumference and volume was poor. However, in general, the rates of change, i.e., the relations between volume and time, and circumference and time, were statistically significant ( $p < .05$ ). (Author abstract) 7 refs.

**086409 CONCEPTUAL FRAMEWORK FOR TACTUALLY GUIDED EXPLORATION AND SHAPE PERCEPTION.** A conceptual framework for tactually guided exploration and shape perception using a robotic medium is provided. The conceptual framework identifies the needed sensory information, the spatial and temporal transformations of this information, the control mechanism, both feedforward and feedback, for performing the missions and the perception machinery. These attributes, in turn, sharpen the focus on the major building blocks needed in design of artificial skins, tactile sensing, and processing systems of the future. These building blocks are identification of central nervous system (CNS) machinery in living systems that perform the required computations, mappings, processors for extraction of the needed manipulation and recognition parameters, processing of outputs of populations of natural tactile sensors, and finally, understanding the dynamics of sensor-imbedded skin and artificial skin in fixed, gliding, and rolling contact with known and unknown objects and surfaces. 48 refs.

**086410 HEMODYNAMIC AND FUNCTIONAL CONSIDERATIONS OF THE JARVIK TOTAL ARTIFICIAL HEART (TAH).** The Jarvik TAH has been used as a bridge to cardiac transplantation in 14 patients between October 1985 and April 1987. Transplantation was accomplished in 13 of 14 patients, and 8 of those are alive and doing well at home. Early experience indicates that the 100 CC device was used whenever the size of the patient permitted (three of the first four cases), because of its availability and the presumed hemodynamic advantage of the larger device. Because the 70 CC device was found to be considerably easier to implant and presented less risk of fit associated occlusion of the vena cavae and pulmonary veins, the subsequent 10 patients have had the smaller device implanted regardless of their size (56 kg to 104 kg). The purpose of this report is to describe and compare the hemodynamic and functional performance of the two devices. 4 refs.

**086411 NEW CONNECTOR SYSTEM FOR TOTAL ARTIFICIAL HEARTS: PRELIMINARY RESULTS.** The atrial cuff and vascular graft connector junctions and the valve mounting junctions have been identified as two major predilection sites for thrombus formation in the valve containing portion of the quick connector system. To reduce thrombus formation in these areas, a high precision screw type connector system (CS-I and CS-II) has been designed. In addition, a new technique has been used to seat commercially available valves into a mounting ring and seal them before incorporation into the total artificial heart. 6 refs.

**086412 LONG-TERM SURVIVAL WITH A PNEUMATIC ARTIFICIAL HEART.** Pneumatic total artificial hearts (pTAHs) have been under development for nearly three decades. Survival in experimental animals has gradually increased from several hours in the initial experiments to nearly a year in more recent reports. Recently, temporary implantation of pTAHs as a bridge to heart transplantation has been reported by several groups. This report presents recent clinical and experimental experience with the Penn State University pneumatic total artificial heart (PSU-pTAH). Study materials, animals, methods and results are discussed. 8 refs.

**086413 REGISTRY AND TABULATIONS OF ORTHOTOPIC TOTAL ARTIFICIAL HEARTS IN HUMANS.** The pneumatically powered artificial hearts have been used as a bridge to cardiac transplantation with increasing frequency since 1985. Pneumatically powered, orthotopically placed total artificial hearts (TAHs) have been used in 68 patients through March 31, 1987. Five of these patients were designated as nontransplantable candidates. Sixty-three TAH recipients were bona fide cardiac transplantation candidates. The Symbion (Jarvik series) device was implanted in 51 patients: 41 were transplanted with 26 patients alive, 51% of those patients receiving a TAH. Of those patients who received transplants, 63% were alive with good to excellent outcomes. All of the users of the Symbion devices have had an extensive training program that contributes to this success. Additional aspects of the subject and data gathered are

discussed. 20 refs.

**086414 MODE COMPARISON STUDY FOR A COMPLETELY IMPLANTABLE TAH (CITAH) SYSTEM.** The long-range objective of the work reported has been the development of a control algorithm to meet the following requirements: 1) simple and reliable; 2) smallest physical package to meet anatomic constraints; and 3) adequate responses to all possible hemodynamic demands. If the alternate beating mode could maintain the recipient for extended periods and also have meaningful flow responses to demand, the overall volume and complexity of a CITAH would be reduced significantly. Some comparison studies with PP TAH systems have been published, a few aspects still remained to be investigated: 1) long-term effects of the alternate beating mode; 2) how to protect the lung circulation against any possible sudden hemodynamic changes, and 3) the possible requirements for built-in stroke volume differences between two ventricles. This study was designed and performed to answer these questions. 11 refs.

**086415 TOWARD A COMPLETELY IMPLANTABLE TAH: A LEFT-RIGHT SIMULTANEOUSLY EJECTING MOTOR-DRIVEN TAH SYSTEM.** As shown in recent total artificial heart studies, even with the alternate ejection system an auxiliary compliance chamber is required to compensate for the left-right flow differences and differences in ejection and filling times between the two ventricles. In addition, alternate ejection is unphysiologic in comparison to the simultaneous ejection of the natural heart. The design of the left-right simultaneously ejecting system was previously proposed. This paper describes the left-right simultaneously ejecting motor driven total artificial heart using a single electromechanical actuator, and presents in vitro evaluation. Study materials, methods and results are discussed. 8 refs.

**086416 AUGMENTATION OF CO<sub>2</sub> TRANSFER IN MEMBRANE LUNGS BY THE INFUSION OF A METABOLIZABLE ORGANIC ACID.** Clinical observation suggested that the continuous acidification of the blood entering the membrane lung with small amounts of a strong organic metabolizable acid such as L-lactic acid might significantly augment the CO<sub>2</sub> transfer of membrane lungs, yet be cleared by metabolism and avoid a progressive metabolic acidosis. In this paper the authors present theoretical calculations, in vitro testing of an aqueous sodium bicarbonate perfusate equilibrated with CO<sub>2</sub>, and in vivo perfusions in awake sheep demonstrating that short-term increases of 120-170% in CO<sub>2</sub> transfer rate can be obtained by membrane lung inlet acidification with 2 to 8 mEq/min of L-lactic acid. 25 refs.

**086418 NEW HYBRID ARTIFICIAL LIVER USING A COMBINATION OF HEPATOCYTES AND BIOMATRIX.** To supplement deficient functions of mechanical artificial livers, the combined use of biologic artificial livers utilizing viable hepatocytes becomes necessary. Survival efficiencies and retention of metabolic function of hepatocytes are especially important. M. Rojkind et al. reported that liver extracellular matrix (biomatrix) is extremely useful as a culture substrate for long-term maintenance of functional cultured hepatocytes. In this paper, as one step toward their application to biologic artificial livers, isolated hepatocytes and biomatrix were simultaneously administered intraperitoneally to rats with d-galactosamine induced hepatic failure, and the effect on the survival rate was studied. 9 refs.

**086419 TOWARD AN IMPLANTABLE IMPELLER TOTAL HEART.** Since 1985, a 3-year project supported by the Chinese Academy of Sciences has been carried out at the Shanghai Second Medical University. This initial goal was to develop a left ventricular assist impeller pump. After solving the main problems of any centrifugal pump i.e., hemolysis, bearing and sealing, and generation of pulsatile flow, the authors have gone on to develop both non-pulsatile and pulsatile pumps which produce minimal amounts of hemolysis. On the basis of this progress a prototype design of a total impeller heart was developed. 17 refs.

**086420 EXPLANT ANALYSIS OF THIRTY-THREE BRIDGE TO TRANSPLANT  $\beta$  TOTAL ARTIFICIAL HEART DEVICES.** From August 1985 to January 1987, 33 Symbion- $\beta$  TAH's were implanted for varying durations. Routine post mortem examination of these devices, conducted by Symbion Inc., entailed external and internal surface macroscopic evaluation, scanning electron microscopy (SEM) analysis, histopathologic analysis of suspect material surfaces and foreign deposits, and material integrity testing on devices implanted for significant durations. This paper discusses the general findings of the 33 TAH devices in terms of thrombus deposition scoring results, prominent areas and types of cellular deposition, and the items that appear to affect red cell and/or thrombus deposition in these devices. 7 refs.

**086421 PHYSIOLOGICAL PROFILE DURING VENOVENOUS PERFUSION IN DOGS USING A POLYPROPYLENE MEMBRANE LUNG WITH SECONDARY FLOWS.** Venovenous perfusion has been conducted in 12 healthy dogs to examine carbon dioxide ( $\text{CO}_2$ ) transfer and haemocompatibility over 9 h during total extracorporeal  $\text{CO}_2$  removal using a microporous polypropylene membrane lung with secondary flows in the blood channel. The anesthetized animals were maintained normocapnic by including  $\text{CO}_2$  in the inspired gases. The  $\text{CO}_2$  removal was achieved using  $0.631 \text{ mm}^2$  of active membrane, at a pulsatile Reynolds number of 50, and a  $\text{CO}_2$  extraction from blood of  $17.8 \text{ ml (STP) dl}^{-1}$ .

. Gas exchange remained constant during the perfusions. Several aspects of our results suggest that the haemocompatibility of a system of the kind used here is at least as favorable as that of a steady flow device using a continuous silicone rubber membrane of equivalent gas transfer capability. (Author abstract) 40 refs.

**086422 ANALYSIS OF ULTRAFILTRATION AND MASS TRANSFER IN A BIOARTIFICIAL PANCREAS.** A bioartificial pancreas is an implantable device which contains insulin secreting cells (Langerhans islets), separated from the circulating blood by a semi-permeable membrane to avoid rejection. This paper describes the operation of such a device and evaluates the respective contributions of diffusion and ultrafiltration to the glucose and insulin mass transfer. It is shown that the pressure drop along the blood channel produces across the first half of the channel an ultrafiltration flux toward the islet compartment followed in the second half by an equal flux in reverse direction from islets to blood. The mass transfer analysis is carried out for an optimal geometry in which a U-shaped blood channel surrounds closely a very thin islet compartment formed by a folded flat membrane. A complete model of insulin release by this device is developed and is compared with in vitro data obtained with rats islets. (Edited author abstract) 6 refs.

**086424 ARTIFICIAL HEART IMPLANTATION.** Since 1975 experiments have been being conducted at the Scientific-Research Institute of Transplantation and Artificial Organs on the POISK model of an ellipsoidal artificial heart, which was developed at this institute. A modification of the model of a diaphragm type made from polyurethane has been used in recent years. At present the average survival of calves with an implanted heart is more than 55 days with a maximum survival of more than 3 months. The high implantability of the ellipsoidal artificial heart permits implanting it in calves with a weight from 60 kg, whereas animals with a weight from 85 to 95 kg are usually used. The stroke volume of the artificial ventricles of the POISK model is from 90 to 100 ml, which makes it possible to achieve an output of 12-13 liters/min. As our experience shows, the use of an ellipsoidal heart of the POISK type with a semirigid housing does not lead to thrombosis within the blood chamber (excluding the inlet valve) in those cases when an adequate anticoagulation regime was maintained. 13 refs.

**086425 DEVELOPMENT OF THE LEFT VENTRICULAR BYPASS PUMPS FOR ADULTS AND CHILDREN.** In animal experiments with goats and dogs, and also by clinical applications for adults and children the small Left Ventricular Bypass Pumps with the stroke volume of 30-35 ml and 10-15 ml respectively are desirable. We have developed two prototype pumps to meet with such requirements. The in vitro and in vivo experiments have shown that these pumps with the

advantages of the simplified production, the possibility of the reuse of the pump components and less thrombosis can sufficiently assist the circulation of experimental animals. (Author abstract) In Chinese. 2 refs.

**086426 STUDY ON SYSTEMIC CIRCULATORY SIMULATOR.** A systemic circulatory simulator was devised for study of left ventricular assistance. The device consisted of four parts: two systemic arterial chambers, a systemic venous chamber, a resistor, and a blood pump. The systemic circulatory system was simulated in compliance with sealed air chambers, i.e., double for arterial and single for venous system, while the peripheral vascular resistance was simulated with a special resistor consisting of bellows, a cone valve, and a spring. Arterial pressure waves were recorded, and showed a sharp rise in the ascending part and a marked dirotic wave in descending part, similar to the aortic pressure wave of human body with the systemic flow (P-Q) curve similar to that of the normal subject. (Edited author abstract) In Chinese. 19 refs.

**086427 BLOOD HEMOLYSIS BY PTFE AND POLYURETHANE VASCULAR PROSTHESES IN AN IN VITRO CIRCUIT.** In order to improve understanding of the appearance of bright yellow stains in vivo (consecutive to the absorption of bilirubin) on a novel microporous, hydrophilic polyetherurethaneurea vascular prosthesis, the in vitro hemolytic activity of the material was compared with expanded polytetrafluoroethylene and silicone rubber. The results show that the tendency of the polyetherurethaneurea to produce free hemoglobin is low, so that the yellow staining observed is likely to be a result of the contact between the polymer and thrombi. Bilirubin is produced because of hemoglobin degradation in the thrombi rather than an active hemolysis on the surface of the prosthesis itself. (Author abstract) 18 refs.

**086428 EFFECTIVENESS OF A COUNTERPULSATION DEVICE IMPLANTED ON THE ASCENDING AORTA.** The abdominal aortic counterpulsation device (AACD) has proved more effective than the intraaortic balloon pump, and the effectiveness of this device along with its biocompatibility make it a promising device for chronic mechanical assistance. On the other hand, the closer to the aortic valve a counterpulsation device is implanted, the more effective it is. This paper reports on an evaluation of the hemodynamic effects of a valveless counterpulsation device implanted on the ascending aorta in a left ventricular heart failure model. 12 refs.

**086429 COMPARATIVE ANALYSIS OF THROMBOGENICITY AND CLINICAL PATENCY BETWEEN WOVEN AND KNITTED AORTO-ILIAC AND AORTO-FEMORAL PROSTHESES.** A special bifurcated graft consisting of one woven limb and one knitted limb was implanted into 158 patients. They were then followed for 4 years and 3 months. The patients were

diagnosed as having either occlusive arteriosclerotic disease of the abdominal aorta or an abdominal aortic aneurysm. The role of platelet deposition in relation to thrombus formation was also considered. To test the relative thrombogenicity of the different graft materials, 20 patients with autologous platelets labeled with <sup>111</sup>Indium were studied. The 20 patients were divided into three groups - those 2 weeks, 1 year, and 2 years after implant - and scans were obtained to demonstrate a difference in platelet aggregation between the two grafts. Study results are discussed. 14 refs.

Burtoft, John N. (Charlotte Memorial Hospital & Medical Cent, Charlotte, NC, USA); Robicsek, Francis; Daugherty, Harry K.; Cook, Joseph C.; Selle, Jay G.; Hess, Philip J.; Lawhorn, Robert. *ASAIO Trans* v 33 n 3 Jul-Sep 1987 p 207-211.

**086430 LOW DENSITY LIPOPROTEIN ACCUMULATION BY PTFE GRAFTS IN THE RABBIT AORTA: AUTORADIOGRAPHIC-MORPHOLOGIC CORRELATIONS.** In earlier studies, the authors showed that healing arteries in rabbits and atherosclerotic arteries in humans sequestered radiolabeled low density lipoproteins (LDL), the major cholesterol-carrying proteins of human plasma. The focal accumulation of radiolabeled LDL permitted external imaging of the affected arteries. Since arterial grafts provoke a healing response analogous in many respects to native arterial intimal repair, the authors tested the possibility that healing prosthetic vascular grafts might also accumulate radiolabeled LDL. This paper reports preliminary studies of the sequestration of LDL by arterial grafts in the rabbit and the potential significance of the finding for monitoring graft function and predicting graft failure. 13 refs.

Miller, Arnold (New England Deaconess Hospital, MA, USA); Schoen, Frederick J.; Lees, Ann M.; Fallon, John T.; Strauss, H. William; Lees, Robert S. *ASAIO Trans* v 33 n 3 Jul-Sep 1987 p 489-493.

**086431 HUMAN ENDOTHELIAL CELL ATTACHMENT RECEPTORS.** The present study evaluates the efficacy of 15 lectins to identify the presence of cell surface glycoconjugates in human umbilical vein endothelial cells (HUVEC) and the further use of these lectins as specific attachment receptors for HUVEC. The results of these studies demonstrate that  $\alpha$ -L-fucose binding lectin (Ulex I) is a specific and fast attaching substrate for HUVEC isolated by the collagenase procedure. Lectin binding intensity to HUVEC glycoconjugates does not parallel the HUVEC attachment profile of these lectins. RCA and WGA demonstrate the highest binding intensity to HUVEC, whereas Ulex I results in superior cell attachment. Additional study results are discussed. 27 refs.

Parhizgar, Azin (Brown Univ, Providence, RI, USA); Galletti, Pierre M.; Jauregui, Hugo O. *ASAIO Trans* v 33 n 3 Jul-Sep 1987 p 494-500.

**086432 ENDOTHELIAL CELL SEEDING OF ULTI CARBON-COATED SMALL-DIAMETER PTFE VASCULAR GRAFTS.** The relative nonthrombogenicity of ultralow temperature, isotropically (ULTI) carbon-coated, small-diameter vascular prostheses, compared with polytetrafluoroethylene (PTFE) grafts of the same size, has been reported. The authors speculated that in addition to their inherent property of biocompatibility, carbon-coated graft surfaces might provide an excellent substrate for attachment of seeded endothelial cells. Therefore, in the canine carotid artery model the authors evaluated the efficacy of endothelial cell seeded and nonseeded 4 mm ID PTFE vascular prostheses that had been coated with ULTI carbon. 17 refs.

**086433 POLYURETHANE VASCULAR PROSTHESES IN PIGS.** Microporous, compliant vascular prostheses made from segmented polyurethanes of various molecular stability, have been implanted in the infrarenal aorta of young pigs. Prosthesis prepared from a hydrolyti-

cally stable polyetherurethane showed a limited patency up to 1 month. Composite prosthesis with the wall made from a hydrolytically stable polyurethane and the lumen side prepared from a degradable polyurethane, were patent up to one year. A degradable layer of this composite prosthesis induced the growth of a neo-artery. Prosthesis prepared from a degradable polyurethane alone, were substituted within 4 months with a functional neo-artery. (Author abstract) 17 refs.

**086434 CHARACTERIZATION OF THE TISSUE PROLIFERATED AT THE BLOOD INTERFACE OF CARBON/CERAMIC COMPOSITES.** The reconstruction of a normal arterial wall in human surgery remains an unfulfilled dream. To ensure long-term graft patency it would be necessary to achieve complete healing of the prosthetic wall, i.e., an endothelialized surface. The ideal vascular substitute must be linked by tissues and cells that possess morphological and functional characteristics of the normal vascular elements. The present study focuses on cell adhesion/differentiation and material stability of surfaces of the three carbon/ceramic composites implanted in intra-atrial position in dogs for 1 year. Before implantation their surface was characterized by scanning electron microscopy. After harvesting, the tissue proliferated on the blood interface was examined by histology, scanning, and transmission electron microscopy, wavelength dispersive and x-ray spectrometry, electrophoretic and enzymatic characterization of glycosaminoglycans (GAGs) which were compared to endocardial tissue as control samples. (Edited author abstract) 23 refs.

**086435 HYDROPHILIC MICROPOROUS POLYURETHANE VERSUS EXPANDED PTFE GRAFTS AS SUBSTITUTES IN THE CAROTID ARTERIES OF DOGS. A LIMITED STUDY.** A novel, microporous, hydrophilic polyether urethane-urea (PEUU) vascular graft was compared with expanded PTFE in the canine carotid artery. At implantation times ranging from 4 h to 6 months, all the PEUU grafts were found to be occluded while of the PTFE grafts, only those implanted for 1 week and 6 months were blocked. Histopathological analysis of the explanted grafts and their capsules revealed an ongoing inflammatory reaction at the anastomotic sites of the PEUU grafts. (Author abstract) 12 refs.

**086436 EFFECTS OF PORE SIZE AND ENDOTHELIAL CELL SEEDING UPON THE PERFORMANCE OF SMALL-DIAMETER e-PTFE VASCULAR GRAFTS UNDER CONTROLLED FLOW CONDITIONS.** The purpose of this study was to determine the effects of endothelial cell seeding and graft internal distance upon the performance of 4-mm-ID e-PTFE grafts during acute reduced blood flow conditions. PTFE grafts especially manufactured with three different mean internal distances (28, 40, and 52  $\mu$ m) were evaluated. Fifteen dogs underwent bilateral carotid artery replacements. In each dog one graft was seeded with enzymatically derived endothelial cells; the contralateral graft was nonseeded. All grafts were evaluated 5 weeks postoperatively. Endothelial cell seeding improved patency and thrombus-free surface areas in grafts of all pore sizes. (Edited author abstract) 19 refs.

**086437 VASCULAR PROSTHESES: PRESENT STATUS AND FUTURE DEVELOPMENT.** Advances in small vessel reconstruction include the use of autogenous veins for small diameter and coronary artery lesions and microvascular repair of digital and cerebral vessels. Future developments in graft design will enable prosthetic repair of 2 to 4 mm arteries and reconstruction of veins. 98 refs.

White, Rodney A. *Blood Compat* v 2. Publ by CRC Press Inc, Boca Raton, FL, USA, 1987 p 47-61.

**086438 COMPLIANT SMALL-DIAMETER ARTERIAL PROSTHESES.** A synthetic artery graft is manufactured from polyetherurethane fibers (Biomer). It is sufficiently porous to allow ingrowth of collagenous scar tissue. Biomer has good enzyme resistance, good blood compatibility, and confers compliance to the prosthesis in both circumferential and axial directions. 16 refs.

**086439 EFFECT OF POROSITY AND BIOMATERIAL ON THE HEALING AND LONG-TERM MECHANICAL PROPERTIES OF VASCULAR PROSTHESES.** Continuing efforts in vascular prosthetic design are focused on understanding the characteristics required for function of small internal diameter and low-flow prostheses. The pioneers of vascular surgery developed large diameter textile prostheses for successful reconstruction of the aortiliac vessels, but fabric grafts function poorly in diameters less than six millimeters. Major advances in small vessel reconstruction include the use of autogenous vessels for coronary artery lesions and microvascular surgery of digital and cerebral vessels. The author believes that future advances in graft design will enable prosthetic repair of two to four millimeter arteries and reconstruction of veins. This manuscript discusses the development of improved synthetic blood-compatible surfaces with detailed consideration of prosthetic design factors such as pore size, biomaterial mechanical properties and thrombogenicity of the blood flow surface. (Author abstract) 25 refs.

**086440 STABILITY OF PERFORMANCES OF VASCULAR PROSTHESES RETROSPECTIVE STUDY OF 22 CASES OF HUMAN IMPLANTED PROSTHESES.** Twenty-two cases of vascular graft failures (thrombosis, pseudoaneurysm, dilation, infection) were investigated by means of physicochemical, histological, and ultrastructural studies. A general decrease of mechanical resistance to stress of the prostheses was observed. Its magnitude ranged from 2 to 75% of the values of identical virgin prostheses and there was no relation with the duration of implantation. In addition to the breakage of yarn filaments (SEM), migration of fiber debris (histology) was observed in 7 cases. The structure of the polyester molecule had evolved after implantation. A decrease of crystallinity (x-ray diffraction and differential scanning calorimetry) was noted. These observations raise the question of the established stability of vascular prostheses and emphasize the need for further investigations in human graft retrieval programs. (Author abstract) 32 refs.

**086441 HYDROLYTIC STABILITY OF MITRATHANE (A POLYURETHANE UREA)-AN X-RAY PHOTOELECTRON SPECTROSCOPY STUDY.** The hydrolytic stability of the microporous Mitrathane polyetherurethane urea vascular prostheses has been

evaluated at pH 7 and pH 9, at 37°, 60°, and 80°C for time periods of up to 968 days. Mechanical strength was evaluated using a hydrodynamic burst test and surface chemical changes by x-ray photoelectron spectroscopy. The samples held at 80°C showed the greatest mechanical strength loss which corresponded to the hydrolysis of the urethane groups. It was concluded that the gross in vivo surface degradation of Mitrathane prostheses, observed after six months, could not have been caused by simple chemical hydrolysis alone, as the polymer was found to be stable at 37°C for at least 11 months. (Author abstract). 25 Refs.

**086442 BLOOD COMPATIBILITY OF SURFACES MODIFIED BY PLASMA POLYMERIZATION.** Tubular blood-contacting polymeric materials were modified by plasma polymerization and evaluated in the baboon with respect to their capacity to introduce both acute and chronic arterial thrombosis. Polymer surface composition was determined by electron spectroscopy for chemical analysis. Steady-state arterial thromboembolism was initiated by introducing tubular segments into chronic arteriovenous shunts. Rates of platelet destruction induced by the test materials were calculated from  $^{111}\text{In}$ -platelet survival measurements. Nine plasma polymers based on tetrafluoroethylene, hexafluoroethane, hexafluoroethane/ $\text{H}_2$ , and methane, when deposited on silicone rubber, consumed platelets at rates from  $1.1\text{--}5.6 \times 10^8$  platelets/ $\text{cm}^2\text{-day}$ . These low values were considered relatively nonthrombogenic. Acute thrombus formation was initiated by inserting expanded Teflon (Gore-Tex PTFE) vascular grafts into the shunt system. (Edited author abstract). 25 Refs.

## Computer Aided Design

**086444 IMPACT OF ADVANCED MANUFACTURING TECHNOLOGY ON PROSTHETIC AND ORTHOTIC PRACTICE.** Radical changes in the technology applied to prosthetics and orthotics are being proposed. This paper attempts to define the scope and character of advanced manufacturing technology and examines the rehabilitation problems which are or could be tackled. Lower-limb prosthetics has been the major area under investigation so far, but orthopaedic footwear, spinal orthotics and custom seating for the disabled have also been investigated using similar technological approaches. The whole process of patient measurement, device design, and component manufacture is conceived as an integrated system relying upon shape of tissue property sensing, computer based device design and computer-numerically-controlled or robot manufacturing processes. The aim is to retain flexibility for custom design which is necessary to provide for individual patients, and yet improve the rapidity and precision of overall device manufacture and service delivery. (Author abstract) 12 refs.

## Control

**086445 LIMB-FUNCTION DISCRIMINATION METHOD USING EMG SIGNALS FOR THE CONTROL OF MULTIFUNCTIONAL POWERED PROSTHESES.** This paper describes a method to estimate the motion intended by an amputee from his EMG symbols. This is one of the important abilities to be provided by the amputee-prosthesis interface within the multifunctional powered prosthesis. To make the interface easy for the amputee to use, the measurement of EMG should be simplified as much as possible. Up to now, function discrimination by the surface EMG has been employed in which a particular muscle must be specified for the EMG electrode. This imposes a restriction in the electrode placement, and restricts the function discrimination ability. The present study aims at the development of a discrimination method in which the electrode locations are made flexible by utilizing the cross-information among the electrodes as well as the amplitude and frequency characteristics of the EMG. The method proposed is a combination of the multidimensional AR model and the discriminant function. It is shown by experiment that the method can discriminate, with accuracy above 93%, 6 motions of forearm and hands using 4 pairs of electrodes and EMG for 100 ms after motion generation. Thus the method can simplify the electrode placement and realize a high discriminating ability. (Edited author abstract) 14 refs.

## Electrodes

**086447 CURRENT DENSITY PROFILES OF SURFACE MOUNTED AND RECESSED ELECTRODES FOR NEURAL PROSTHESES.** A Green's function approach has been used to solve Laplace's equation for the quasistatic fields of a recessed, disk electrode. The resulting integral equation was solved numerically using the moment method. An analysis of the error in the approximate solution shows that it must be less than 7% for the cases studied. The calculations indicate that a recessed electrode has a more uniform current density profile than a surface mounted electrode, both at the electrode surface and at the electrode carrier-tissue junction. The significance of this finding is discussed as its application to electrochemical, histopathological, and physiological studies of neural prostheses. The clinical use of recessed electrodes in cochlear implants is recommended. 52 refs.

**086448 REDUCTION OF ELECTRICAL INTERACTION IN AUDITORY PROSTHESES.** A method based on the thresholds of multiple electrode stimuli was developed to calculate accurately, in multichannel implants, the mapping from electrode current levels to excitation levels at each neural site. For the implant subjects tested, this technique accurately predicted thresholds for arbitrary patterns of stimulation. Inverting this mapping matrix produced patterns of stimulation that selectively stimulated only one neural site with minimum of interaction, while satisfying current limit constraints. These sharpened stimuli exhibited lower interaction and were pitch ranked with greater consistency than either monopolar or bipolar stimuli. 9 refs.

## Failure

**086449 FAILURE ANALYSES OF ORTHOPEDIC ARTIFICIAL PROSTHESES.** Three cases of failures of different kinds of artificial prostheses which were implanted in human bodies and were made of various materials have been investigated in this paper. According to metallographic and fractographic examinations and mechanical analyses, the authors have concluded that the failures were caused by fatigue cracking and corrosion fatigue cracking of implanted materials, and that the designs of prostheses were inadequate for real loads. In order to improve the qualities and reliabilities of biomaterials the authors have suggested that a series of tests of fatigue, stress corrosion and corrosion fatigue in simulated in vivo conditions is necessary. The authors have also suggested that the designs of artificial prostheses should be based on sufficient biomechanical experiments and calculations. (Edited author abstract) In Chinese. 13 refs.

**086450 COMPLETELY NEW POLY(ETHER-URETHANE) GRAFT IDEAL FOR HEMODIALYSIS BLOOD ACCESS.** Expanded polytetrafluoroethylene (E-PTFE) grafts have been used frequently to establish blood access for patients having no suitable arteries and veins to create arteriovenous fistulas. These grafts have several advantages over saphenous vein or bovine arterial grafts, but they could not be called ideal for blood access. A completely new synthetic vascular graft has been fabricated from poly(ether-urethane) with the use of an innovative casting method. In this report basic studies and animal experiments are introduced along with preliminary clinical applications. 5 refs.

**086451 NEW GRAFT MATERIALS AND CURRENT APPROACHES TO AN ACCEPTABLE SMALL DIAMETER VASCULAR GRAFT.** Prosthetic graft material has not been successful for small artery bypass. Mechanical, cellular, and humoral factors have all been implicated as a cause of failure. In vitro, ex vivo, and in vivo methods have been developed to assess platelet and fibrinogen deposition, measure compliance, and study other factors theorized to relate to graft failure. Cell culture techniques have been used to determine the role of cellular mitogens. The goal of an arterial substitute that can maintain patency in a 3-4 mm diameter low-flow configuration and that is not associated with the develop-

ment of anastomotic hyperplasia has yet to be reached. A variety of solutions are being researched. New nonthrombogenic polymers are being tested as are new coatings for standard materials. Endothelial cell seeding has been accomplished in animals and is being tried in human clinical studies. (Edited author abstract) 112 refs.

**086452 RECONSTRUCTION OF THE DIGITAL PULLEY IN THE MONKEY USING BIOLOGIC AND NONBIOLOGIC MATERIALS.** A-2 pulleys were replaced in the hand of the nonhuman primate; on the long/little fingers the pulleys were reconstructed with a woven nylon fabric (Nitec), and on the ring/index fingers the pulleys were reconstructed with fascia lata. The opposite unoperated hand served as a control. At 2, 3, and 6 months postoperative, the animals were killed to compare the function of the reconstructed pulleys with the control pulleys of the opposite digit. Using a tensile testing machine, two parameters, work of flexion and tendon excursion, showed that both pulley reconstructions permitted minimal tendon bow-stringing and had excellent gliding function. Both materials increased in strength over time to become stronger than the control pulley. The Nitec pulley compared favorably with the fascia pulley biomechanically and histologically; both reconstructed pulleys functioned well compared with normal pulleys. (Edited author abstract).

**086453 PERICARDIAL HETEROGRAFT VALVES: AN ASSESSMENT OF LEAFLET STRESSES AND THEIR IMPLICATIONS FOR HEART VALVE DESIGN.** This study uses experimental results obtained from cyclic uniaxial load tests to predict the type and magnitude of operational stresses which occur in pericardial heterograft leaflets. Both Young's modulus and Poisson's ratio varied with uniaxial loading in pericardium, chemically modified free of tension. Leaflet stresses were analyzed by using effective incremental representations of these parameters. In leaflets with unrestricted rotation at the point of attachment to the stent, the mid-plane tensions always exceeded the bending stresses, and no zones of leaflet compression were predicted. In contrast, with totally restricted leaflet rotation induced by clamping (possibly between a male and a female frame) the bending stresses were greater than the mid-plane tensions at the hinge line and significant compressive stresses were predicted at this site. Glutaraldehyde fixation of the pericardium under load produced a stiffer material. These and other study results are discussed. (Edited author abstract) 17 refs.

**086454 CHOICE OF HEART VALVES.** Although there have been a number of heart valve prostheses that have been adaptations of the types described, there are currently five basic types of prosthetic valves. In order to make the discussion workable, this paper presents each type of valve as it relates to hemodynamics, thromboembolism, durability, and cost. Hemolysis, previously a factor in prosthetic valves, now occurs at such an insignificant rate as to not be a factor in valve selection. It uses an example only one valve of each type. For the caged ball: Starr-Edwards; tilting disc: Hall-Medtronic; bileaflet: St. Jude; bioprosthesis: Hancock porcine bioprosthesis; and homografts: CryoLife. 26 refs.

**086455 INHIBITION OF BIOPROSTHETIC**

**HEART VALVE CALCIFICATION WITH COVALENTLY BOUND AMINOPROPANEHYDROXYDIPHOSPHONATE.** Aminodiphosphonate pretreatment of bioprosthetic heart valves (BPHV) has been shown in a very limited study to effectively inhibit calcification of bioprosthetic heart valve tissue in the rat subdermal model without adverse effects. Therefore, the purposes of this study were to determine, at physiologic pH, the optimal duration of incubation in aminopropanehydroxydiphosphonate (APDP) at which profound inhibition of tissue calcification would occur. Secondly, the amount of bound APDP that significantly inhibited calcification was determined. Finally, the question of adverse side effects caused by APDP on calcium metabolism and growth was addressed. 12 refs.

**086456 TURBULENCE DOWNSTREAM FROM THE IONESCU-SHILEY BIOPROSTHESIS IN STEADY AND PULSATILE FLOW.** The Ionescu-Shiley (IS) bioprosthesis has become increasingly popular as an aortic valve replacement since being released in 1976 for general use in the United States. The turbulence generated downstream from an aortic Ionescu-Shiley bioprosthesis has been investigated in vitro with both steady and pulsatile flow. Instantaneous point velocities were measured using laser-Doppler anemometry (LDA) at numerous preselected locations in the flow. The mean and RS velocities from these data at each location were then used to estimate the laminar and turbulent shear in the bulk flow as a function of radial position on a cross-section of the flow system downstream from the mounted prosthesis. Estimated total shear stresses were found in the bulk flow of sufficient magnitude to possibly cause hemolysis and initiate platelet chemical-release reactions. (Edited author abstract) 30 refs.

**086458 IN VITRO ULTRASONIC IMAGING OF FLOW THROUGH PROSTHETIC HEART VALVES.** A rapid, inexpensive, portable technique has been developed for the qualitative and semiquantitative evaluation of in vitro flow characteristics through prosthetic heart valves. The technique combines a cardiac pulse duplicator and any diagnostic, linear sequential array, ultrasonic imaging system. The pulse duplicator has been modified to include an acoustically transparent aortic section which contains the prosthetic valve to be evaluated. The acoustically transparent section is fabricated from Rho-c rubber and enables direct flow-imaging for several centimeters on both sides of the prosthesis. Aerated tap water is used as a contrast medium. Forward and reverse flow, laminar flow complex eddy patterns, regurgitation, and jets are easily observed in real time over a wide field of view. Time-exposure photography of sequential images and subsequent off-line calculations enable point-by-point determinations of flow velocities. (Edited author abstract) 12 refs.

**086461 IN VITRO STRESS MEASUREMENTS IN THE VICINITY OF SIX MECHANICAL AORTIC VALVES USING HOT-FILM ANEMOMETRY IN STEADY FLOW.** Based on hot-film anemometry, point velocity measurements in the total cross sectional area 1 and 2 diameters downstream of Bjork-Shiley Standard, Convex-Concave and Monostut, Hall-Kaster (Medtronic-Hall), St. Jude Medical and Starr-Edwards Silastic Ball aortic valves were made. The spatial distribution of Reynolds Normal Stresses (RNS) was visualized three-dimensionally in order to point out where and to what extent the highest RNS were found. The measurements were made in steady flowing glycerol mixture at flow rates 10, 20 and 30 l. min<sup>-1</sup> corresponding to mean velocities of 27, 54 and 81 cm s<sup>-1</sup>. The highest maximum RNS values were around 250 Nm<sup>-2</sup> and were found downstream of the Bjork-Shiley Monostrut and Starr-Edwards Ball valves. (Edited author abstract) 33 refs.

**086462 HEMODYNAMIC CHARACTERISTICS OF THE 'EMIKS' DISK ARTIFICIAL HEART VALVES.** Artificial replacement of the mitral valve is an effective method of correcting disturbed intracardiac hemodynamics in patients with mitral defect of the heart. The results of this operation in many respects are determined by the hemodynamic characteristics of the artificial heart valves (AHVs) being implanted. Low-profile disk AHVs with a flap closing element of the 'EMIKS' type were introduced into clinical practice in the USSR in 1983. The purpose of the present article is to analyze the hemodynamic characteristics of the 'EMIKS' valves after isolated artificial replacement of the mitral valve. 12 refs.

Semenovskii, M.L. (USSR Ministry of Health, Moscow, USSR); Manukyan, V.E.; Chestukhin, V.V. *Biomed Eng (New York)* v 21 n 5 Sep-Oct 1987 p 163-164.

**086463 METHOD OF DETERMINING THE KINEMATIC PARAMETERS OF DISK ARTIFICIAL HEART VALVES.** Operations on artificial replacement of heart valves have become prevalent in the USSR and abroad. Several thousands of them are performed every year just in our country. Improvement of existing designs and development of new designs of artificial heart valves (AHVs) are continuing. Some of their most important characteristics are the opening and closing time, as well as the rate of movement of the closing elements. These characteristics determine the speed of AHVs and the force loads on its elements. The small disk valves of the foreign

companies Bjork-Shiley, Medtronic-Hall, Omniscience, Sorin, the Soviet-made EMIKS and LIKS artificial valves, and also the two-disk valve made by St. Jude Medical are among the most frequently used ones. A method is proposed in this work for determining the kinematic parameters of disk AHVs under bench conditions. 2 refs.

**086464 INFLUENCE OF CARDIAC FLOW RATE ON TURBULENT SHEAR STRESS FROM A PROSTHETIC HEART VALVE.** Two-component, simultaneous, correlated laser velocimeter measurements were recorded at four different axial locations and three different flow rates in a straight tube model of the aorta. All velocity data were ensemble averaged within a 15 ms time window located at approximately peak systolic flow over more than 300 cycles. Shear stresses as high as 992 dynes/cm<sup>2</sup> were found 0.92 tube diameters downstream of the monostrut, disk valve. The maximum turbulent shear stress was found to scale with flow rate to the 0.72 power. A repeatable starting vortex was shed from the disk at the beginning of each cycle. **086465 RESPONSE TO UNIAXIAL LOAD OF CHEMICALLY MODIFIED BOVINE PERICARDIUM AT DIFFERENT TEMPERATURES.** Non-destructive uniaxial load tests were performed on glutaraldehyde-fixed pericardium at two different temperatures. Samples were tested first at room temperature. Mean response curves to load were constructed. The temperature of the saline test medium was raised to body temperature at 37°C. Analysis of variance demonstrated no statistically significant difference in the response to load of the tissue at the two temperatures. Hence, it appears that the temperature is not an important parameter in the mechanical and accelerated fatigue tests of pericardial heart valve substitutes. (Edited author abstract) 14 refs.

**086466 SELECTION OF A PROSTHESIS FOR HEART VALVE REPLACEMENT ANALYSIS AND FUTURE DEVELOPMENT.** Currently, there are two main categories of cardiac valve replacements: mechanical models, or bioprostheses. Although all available models provide comparable hemodynamic benefits in vivo, none is perfect. Replacement valves must be selected on an individual basis, taking into account the patient's heart size and severity of valve damage; age; medical history; activity level and lifestyle; and postoperative quality of life. Bioprostheses are in general superior to mechanical substitutes. They close more rapidly, have central flow, are quieter, and are less prone to thromboembolic complications. Their durability, however, remains a significant concern. Reliability of tissue valves will likely be enhanced through superior engineering study and analysis of the effects of various tissue treatments and preservation; intensive research in the field of polymer science to develop a sufficiently strong man-made leaflet membrane; and development of new geometrical valve configurations which minimize mechanical stress. (Author abstract). 24 refs.

**086467 MECHANICAL ANALYSIS OF THE CLOSED HANCOCK HEART VALVE PROSTHESES.** In order to obtain mechanical specifications for the design of an artificial leaflet valve prosthesis, a geometrically nonlinear numerical model is developed of a closed Hancock leaflet valve prosthesis. In this model, the fiber reinforcement of the leaflet and the viscoelastic properties of frame and leaflets are incorporated. The calculations are primarily restricted to 1/6 part of the valve and a time

varying pressure load is applied. The calculations are verified experimentally by measuring the commissure displacements and leaflet centre displacement of a Hancock valve. The numerically obtained commissure displacements are found to be linearly dependent on the pressure load, and the slope of the curves is hardly dependent on loading type and loading velocity. Experimentally a difference is found between the three commissure displacements, which is also predicted numerically using a simplified asymmetric total valve model. (Edited author abstract). 32 Refs.

**086468 DYNAMIC ANALYSIS OF FLUTTER IN DISK TYPE MECHANICAL HEART VALVE PROSTHESES.** Parametric study of the low frequency oscillations occasionally observed in certain types of disc type prosthetic heart valves (PHV) are carried out using a finite element technique. The analysis is performed to determine the frequencies of the dynamic fluttering with the help of the 'ANSYS' computer program. The results show that the frequencies of the dynamic fluttering for both the circular occluders and the semicircular occluders are at least two orders of magnitude higher than that observed in vivo. It is thus concluded that the clinically observed leaflet oscillations should not be a dynamic flutter phenomenon. Rather, the vortex shedding has been assumed to be the cause of these oscillations. (Author abstract). 13 Refs.

**086469 TURBULENT STRESS MEASUREMENTS DOWNSTREAM OF SIX MECHANICAL AORTIC VALVES IN A PULSATILE FLOW MODEL.** In a pulsatile flow model aortic Bjork-Shiley Standard, Convex-Concave and Monostrut valves were investigated together with the Hall-Kaster (Medtronic-Hall), St. Jude Medical and Starr-Edwards Silastic Ball valve using hot-film anemometry. Three-dimensional visualization of average systolic Reynolds normal stresses (RNS) reflected the design of the valves. Mean average RNS were used for comparison of the fluid dynamic performance along with Velocity Energy Ratio (VER<sub>100</sub>) and Turbulence Energy Ratio (TER) as a relative turbulence intensity for pulsatile flow. Mean average RNS ranged from 13.2 to 37.6 N m<sup>-2</sup> for all the valves with the highest levels for the Bjork-Shiley Standard and Starr-Edwards Ball valve and lowest values for the St. Jude Medical valve and with the Hall-Kaster (Medtronic-Hall), Bjork-Shiley Convex-Concave and Monostrut valves in between. (Author abstract). 37 Refs.

**086470 THREE-DIMENSIONAL VISUALIZATION OF VELOCITY FIELDS DOWNSTREAM OF SIX MECHANICAL AORTIC VALVES IN A PULSATILE FLOW MODEL.** Velocity fields downstream of 27 mm Bjork-Shiley Standard, Bjork-Shiley Convex-Concave, Bjork-Shiley Monostrut, Hall-Kaster (Medtronic-Hall), St. Jude Medical and Starr-Edwards Silastic Ball aortic valves were studied in a pulsatile mock circulation. Stroke volume was 70 cm<sup>3</sup> and frequency 71 min<sup>-1</sup> and 88 min<sup>-1</sup>. Fluid velocity was measured by a catheter mounted hot-film anemometer probe in a glycerol water mixture one and two diameters downstream of the aortic valve. Velocity fields were dynamically visualized by a three-dimensional technique and revealed qualitative independence of frequency. The differences between the three investigated Bjork-Shiley valves were remarkable. The St. Jude Medical valve generated velocity peaks downstream of the two major orifices and the central slit, and lower velocities in the hinge areas. A rather flat profile with central hollowing was seen downstream of the Starr-Edwards Ball valve. All velocity profiles were more or less dampened two diameters downstream. (Edited

**086471 EFFECT OF DELAY BETWEEN TISSUE HARVEST AND GLUTARALDEHYDE PRETREATMENT ON MINERALIZATION OF BOVINE PERICARDIUM USED IN BIOPROSTHETIC HEART VALVES.** There is concern that delayed glutaraldehyde treatment of bioprosthetic tissue could potentiate calcification by autolytic generation of mineralization nuclei. This study investigated the effects on mineralization of variable delays between harvest of bovine pericardium and initial glutaraldehyde treatment, using tissue implanted subcutaneously in rats for 21 days. Susceptibility to mineralization increased statistically but only modestly with delays to 34 h. This suggests that mineralization will not be significantly inhibited by rapid treatment of otherwise properly handled tissue and that clinically important prevention of calcification will require more dramatic means. (Author abstract). 8 Refs.

**086472 DYNAMIC RESPONSE OF CLOSED BIOPROSTHETIC VALVE LEAFLETS.** The dynamic response of the leaflets of a closed bioprosthetic valve was determined using triangular shell elements. The damping ratio of the system was estimated using a one-dimensional springmass system and was found to be 0.02. This damping ratio was used in estimating the transient response of the three-dimensional leaflets that occurs due to the normal pressure gradient during diastole. The maximal deflection with a Young's modulus of 600 kPa was 3.71 mm. Stiffening of the leaflet was shown to reduce the maximal deflection. A perforation in one of the leaflets (20 percent area of a single leaflet) did not change the response appreciably. (Author abstract). 21 refs.

**086473 in vitro EXPERIMENTAL COMPARISON OF EDWARDS-DUROMEDICS AND ST. JUDE BI-LEAFLET HEART VALVE PROSTHESES.** An in vitro comparison of the hydrodynamic characteristics of the Edwards - Duromedics (DM) and St Jude (SJ) bi-leaflet aortic valve prostheses is presented. Aortic valves 27 mm in diameter were mounted in a pulse duplicator simulating physiological pulsatile flow using a glycerol solution as the blood analogue fluid. Mean trans-valvular pressure difference (TPD) in systole, the percent regurgitation (PCR) and the projected valve orifice area (VOA) were compared at a range of flow rates and heart rates to reflect the functioning of the valve under resting as well as exercise conditions. Study results are discussed. (Edited author abstract). 11 Refs.

**086474 STUDY OF PROSTHETIC HEART VALVE SOUNDS.** A mechanism is proposed for the generation of phonocardiogram (PCG) sounds from implanted mechanical prosthetic heart valves. The structures in the chest, the heart, its partitions, and its major vessels, constitute a frequency-selective system excited by the rapidly decelerating valve occluder. It is shown that the rapidly decelerating valve produces a wide and flat power spectrum and hence is an impulsive excitation that couples energy to the resonance modes specified by the structures in the chest. Consequently, the PCG signal is composed of decaying sinusoids. The parameters of the decaying sinusoids are estimated, and it is observed that the power spectra of the

PCG signals have two dominant peaks in the frequency band of 200-500 Hz. The energy coupled to these two modes depends on the state of the valve. With thrombus, the decelerating occluder slows down and becomes a broader pulse concentrating the energy to the lower resonance mode. This is verified by experiments on 30 postoperative patients. 21 refs.

**086475 HEART VALVE ENGINEERING, PAPERS PRESENTED AT A SEMINAR.** This seminar proceedings consists of fifteen papers. Some of the subject covered are: Laboratory testing of prosthetic valves; pulsatile flow testing of prosthetic conduits; fluid forces on pivoted disc prosthetic valves; hydrodynamic advantages of mechanical bileaflet valves; and clinical aspects - an overview. Other topics are: the use of ceramics; mechanical properties of bovine pericardium; pericardial heterografts; and quality control of heart valves. Long term assessment of heart valve substitutes; modes of failure observed in explanted valves; and quality assurance of valves by in vitro testing are also presented. All of the papers are abstracted separately. Technical and professional papers from this conference are indexed and abstracted with the conference code no. 11224 in the Ei Engineering Meetings (TM) database produced by Engineering Information, Inc.

**086476 CAUSES OF FEMORAL HEAD ROUGHENING IN EXPLANTED CHARNLEY HIP PROSTHESES.** The effect of particles of first, acrylic bone cement containing either barium sulphate or zirconium dioxide as X-ray contrast media, and second, particles of fresh cortical bone, on a surgical grade stainless steel surface against which polyethylene was rubbing, has been investigated. It was found that under physiological loads, particles of acrylic cement which have been embedded in the polyethylene bearing surface caused severe scratching of the stainless steel. Additional study results are discussed. 14 refs.

**086477 CONTACT FINITE ELEMENT STRESS ANALYSIS OF POROUS INGROWTH ACETABULAR CUP IMPLANTATION, INGROWTH, AND LOOSENING.** Two-dimensional linear and contact finite element analyses were conducted of total hip arthroplasty using metal-backed, porous ingrowth acetabular components. The results indicated that when a conventional metal-backed component (without a flange) is initially implanted and subjected to normal loading, these components may experience distraction between the component and the surrounding bone at inferior sites. Compressive stresses in the superior dome cancellous bone, however, will be substantial. If complete porous ingrowth is achieved, the superior dome compressive stresses will be reduced and substantial shear stresses created. If bone ingrowth is achieved only in specific locations, stress transmission will be dictated by those locations and may differ markedly from the case of complete bone ingrowth. In the event that no porous ingrowth is achieved and a fibrous layer forms around the component, the interface stresses will be similar to those calculated for the natural hip. Additional study results are discussed. (Edited author abstract) 32 refs.

**086478 WEAR, CREEP, AND FRICTIONAL HEAT OF FEMORAL IMPLANT ARTICULATING SURFACES AND THE EFFECT ON LONG-TERM PERFORMANCE - PART I, A REVIEW.** Creep and wear of articulating reconstructed joints is a complex process, resulting in adverse tissue response, decreased range of motion, and eventual revision. As improvements are made in the design and surgical techniques of reconstructed joints, the long-term performance of the articulating system and materials becomes more important, particularly for younger, heavier, and more active patients. One aspect previously ignored in the long-term performance of articulating systems is the tendency for these systems to generate heat during articulation, particularly for extended periods of relatively strenuous activity. The present study reviews the various aspects of joint lubrication, friction, wear, and overall system performance. Local heating can increase the creep, wear, and oxidation degradation of UHMWPE, thus, specific attention is given to the effect that heat generation can have on long-term performance of these systems. (Edited author abstract). 101 refs.

**086479 ROLE OF STEM DESIGN AND MATERIAL ON STRESS DISTRIBUTIONS IN CEMENTED TOTAL HIP REPLACEMENT.** The risk of fatigue fractures of the femoral stem in a cemented total hip arthroplasty can be minimized by either increasing the stem cross-section and/or using a very high strength alloy. This study compares important mechanical characteristics of five selected stem designs, differing in configuration and materials (stainless steel, cast chrome cobalt alloy, nickel based alloy and titanium alloy). The strain pattern on the stem was analyzed in a 3-point-bending jig and also after cementing it into cadaver femurs. Regardless of stem type or test method, the typical tensile stress distribution on the lateral stem was a bell shaped curve. For the cobalt-chrome and stainless steel stems, the larger the stem, the lower the stem stresses and stress gradient, and the higher the factor of safety. However, the factor of safety was increased even further by the use of super alloys (MP35N and Ti<sub>6</sub>Al<sub>4</sub>V). (Edited author abstract) 28 refs.

**086480 FATIGUE AND CORROSION FATIGUE TESTING OF HIP JOINT ENDOPROSTHESES IN AIR AND IN NaCl-SOLUTION.** To assure the quality of hip joint endoprosthesis stems, comparative investigations are made for the first time on marketable prostheses of different producers to determine fatigue and corrosion fatigue strength under long time service conditions. The results show that even for these remarkable corrosion resistant materials (cast CoCrMo- and wrought Co-NiCrMo-alloys) under test conditions which are relevant for practice there exists no real fatigue strength, but only a corrosion fatigue loadability for finite life time. The fatigue loadability obtained in air will be reduced remarkably by the simultaneous effect of the physiological NaCl-solution. Recommendations for an effective system of quality assurance are given. (Author abstract) 9 refs.

**086481 GLOBAL MECHANICAL CONSEQUENCES OF REDUCED CEMENT/BONE COUPLING RIGIDITY IN PROXIMAL FEMORAL ARTHROPLASTY: A THREE-DIMENSIONAL FINITE ELEMENT ANALYSIS.** Component loosening in total hip arthroplasty is often accompanied by substantial bony remodelling, associated initially with reduced stiffness of the cancellous bone bordering the cement, and eventually with the formation and proliferation of a compliant fibrous membrane at the bone/cement interface. An anatomically based three-dimensional finite element model has been developed to explore the salient stress changes occurring with progressive degradation of the

stiffness of the cancellous bone in a thin zone bordering the cement. This border zone, modelled as a distinct linearly elastic and isotropic material layer, assumed a geometry and a range of mechanical properties inferred from eventual membrane thickness apparent in recent animal studies of component loosening. The major variables considered were: stiffness (elastic modulus) and compressibility (Poisson ratio) of the border zone, stiffness changes in the outlying cancellous bone, resultant hip contact force, and trochanteric muscle loadings. The results for the limiting case of a non-degraded border zone compared reasonably with previous studies of femoral reconstructions having rigid bone-to-cement attachment. **086482 MULTICHANNEL STRAIN GAUGE TELEMETRY FOR ORTHOPAEDIC IMPLANTS.** In vivo measurements of the loads and deformations occurring in orthopaedic implants will allow future improvements to be made. This paper describes an extremely small telemetry for long term measurements with three strain gauges and methods for an absolutely safe implant design. Developed for measuring the load at hip prostheses, the telemetry can also be used for other implants. Its size makes feasible the instrumentation of devices with only slight mechanical modifications. In addition to the description of our own measuring system, the paper gives a survey on the problems of telemetrized implants, on methods for measuring spatial loads, and on the investigations of other authors. Future publications will present in vivo measurements with this telemetry, among others on hip endoprostheses. (Author abstract) 18 refs.

**086483 EFFECT OF FEMORAL COMPONENT SECTION MODULUS ON THE STRESS DISTRIBUTION IN THE PROXIMAL HUMAN FEMUR.** The study tested the hypothesis that femoral prostheses having a reduced section modulus will provide a distribution of stress in the proximal femur that better matches the stress field present in the normal intact femur. Four embalmed femora from adult human cadavers were instrumented with bonded-foil strain gauges and the states of strain present in the proximal-medial cortex after implantation of three different femoral components were compared with the strain present before implantation. In all cases, low modulus stems showed higher strains than the standard prosthesis. Strains as high as 74 percent of intact were found at the calcar region. Our results suggest that, while lower stiffness stems provide better retention of stress levels, other factors including proximal stem geometry, changes in bending moment after implantation of the prosthesis and cortical bone thickness also played an important role in the strain distribution in bone. (Edited author abstract) 9 refs.

**086484 RADIOGRAPHIC DETERMINATION OF THE ANGLE OF VERSION OF THE FEMORAL COMPONENT IN TOTAL HIP REPLACEMENT.** This paper describes a simple method to determine stem orientation after total hip replacement: It is based on standard antero-posterior radiographs and computes the angle between prosthesis and film plane from the shortening of predefined distances in the projection. The error of the method is less than 5 per cent for the stem orientation and less than 10 per cent for the neck orientation. The

method allows accurate control of stem orientation by means of standard equipment in orthopaedic practice. (Author abstract) 3 refs.

**086486 NONLINEAR FINITE ELEMENT ANALYSIS OF INTERFACE CONDITIONS IN POROUS COATED HIP ENDOPROTHESES.** We used a geometrically simplified finite element model to investigate load transfer between a porous coated hip endoprosthesis and a femur. Assuming both rigidly bonded and nonlinear interfaces, we analyzed fully and partially coated stems that had coatings of different elastic moduli. Our results indicate that maximum values for relative motion in the interface between bone and implant occur for implants with the same elastic modulus as compact bone. By comparison, interface motion is reduced by about half for Co-Cr-Mo alloy stems. We also showed that the elastic modulus of the porous coating had only a small influence on bone stresses. (Author abstract). 17 Refs.

**086487 FRICTIONAL PROPERTIES OF ARTIFICIAL HIP JOINTS.** A new generation of hip replacements has been designed incorporating compliant layers to promote fluid film lubrication when the joints are implanted in patients. Tests in the Durham hip function simulator show that the friction in these joints is up to an order of magnitude lower than in currently used prostheses, and because this is due to complete separation of the rubbing surfaces, wear ought to be vastly reduced. Experiments have shown that the best results are achieved with compliant surfaces of hardness between 4 and 8 N/mm<sup>2</sup>. Such surfaces produce coefficients of friction of the order of  $5 \times 10^{-3}$ . (Author abstract). 9 Refs.

**086488 DESIGN AND DEVELOPMENT OF A VERSATILE HIP JOINT SIMULATOR AND A PRELIMINARY ASSESSMENT OF WEAR AND CREEP IN CHARNLEY TOTAL REPLACEMENT HIP JOINTS.** Although wear testing of bulk materials provides valuable background data, and may lead to an understanding of the various wear mechanisms and the effects of surface topography, a more rigorous and complete simulation of physiological conditions is necessary for the laboratory evaluation of complete prostheses. This can best be provided by the use of a joint simulator. This paper describes the design of a new 3-station hip joint simulator and briefly discusses early results. 5 Refs.

Dowson, D. (Univ of Leeds, Engl); Jobbins, B. *Eng Med* v 17 n 3 Jul 1988 p 111-117.

**086489 PROSTHETIC HIP FAILURE: PRELIMINARY FINDINGS OF RETROSPECTIVE RADIOGRAPH IMAGE ANALYSIS.** The paper presents the results of a retrospective study based on radiographs of 75 successful total hip replacements, and 103 which involved failure of the femoral component of the prosthesis. Measurements were made on radiographs which had been obtained immediately post-operatively, so that the features measured would depend on surgical procedure rather than on any subsequent biological response. Computer image analysis has been used to make precisely defined, reproducible measurements of 58 parameters characterizing the insertion of the femoral component of a standard Charnley prosthesis. These parameters include geometry of insertion, distribution of cement, surrounding bone thickness, and so on. Clinical findings, including patient weight, were also recorded with the measurements on computer disc. Preliminary statistical comparisons indicate that several of the measured parameters are of predictive value for determining the long-term success or failure of total hip replacements. (Edited author abstract). 18 Refs.

**086490 ROTATIONAL MOVEMENT OF FEMORAL COMPONENTS OF TOTAL HIP REPLACEMENTS IN RESPONSE TO AN ANTERIORLY APPLIED LOAD.** Mechanical testing has been performed on total hip replacements implanted in sections of cadaveric femora. A purpose built transducer has been used to measure the rotation of the implant in the bone under loads applied in the anterior-posterior direction. This has been used to assess the effect of cement and also of retaining more of the femoral neck. The retention of the femoral neck improved stability, as did the bone cement, and in the case of the uncemented prosthesis, longitudinal ridges increased the stability of the prosthesis. (Author abstract). 7 Refs.

**086491 LONG-TERM EXPERIENCE WITH TOTAL JOINT PROSTHETIC REPLACEMENT FOR THE ARTHRITIC GREAT TOE.** A report on the use of 13 double-stemmed flexible hinge silicone elastomer implants as total joint replacements for the metatarsophalangeal (MTP) joint of the great toe in 98 patients since 1971. In the 57 patients with osteoarthritis, 81 joints were replaced; in the 30 patients with rheumatoid arthritis, 37 joints were replaced. The results were graded excellent, good, fair, or poor based on relief of pain and cosmesis. The overall results were good. On the basis of these findings, the author concludes that there is a place for total joint prosthetic replacement with this device in the surgical reconstruction of the painful, destroyed MTP joint of the great toe. (Edited author abstract) 29 refs.

**086492 ADAPTIVE BONE-REMODELING THEORY APPLIED TO PROSTHETIC-DESIGN ANALYSIS.** The subject of this article is the development and application of computer-simulation methods to predict stress-related adaptive bone remodeling, in accordance with 'Wolff's Law'. These models are based on the Finite Element Method (FEM) in combination with numerical formulations of adaptive bone-remodeling theories. In the adaptive remodeling models presented, the Strain Energy Density (SED) is used as a feed-back control variable to determine shape or bone density adaptations to alternative

functional requirements, whereby homeostatic SED distribution is assumed as the remodeling objective. These models are applied to investigate the relation between 'stress shielding' and bone resorption in the femoral cortex around intramedullary prostheses, such as used in Total Hip Arthroplasty (THA). It is shown that the amount of bone resorption depends mainly on the rigidity and the bonding characteristics of the implant. (Edited author abstract) 50 refs.

**086493 STRESS COMPATIBLE FINITE ELEMENT FOR IMPLANT/CEMENT INTERFACE ANALYSES.** A new finite element has been developed to enforce normal and shear stress continuity at bimaterial interface points in order to alleviate the problem of high stress discontinuity predictions by the conventional displacement finite element method. The proposed element is based on a five node isoparametric quadrilateral element where the fifth node is located at the interface boundary of the element. A series of validation tests have been carried out to assess the correctness of the stress distribution obtained by the new element at interfaces of highly dissimilar materials. The results of the tests are compared to analytical solutions and to results from convergence studies performed by the conventional finite element method (SAP-IV). Overall, the proposed element has been demonstrated to have a very satisfactory degree of reliability. (Edited author abstract) 21 refs.

**086494 WEAR, CREEP, AND FRICTIONAL HEATING OF FEMORAL IMPLANT ARTICULATING SURFACES AND THE EFFECT ON LONG-TERM PERFORMANCE - PART II, FRICTION, HEATING, AND TORQUE.** The present study was performed to examine closely the propensity to generate heat during articulation in a hip joint simulator. The systems investigated were polished Co-Cr-Mo alloy articulating against UHMWPE, polished alumina ceramic against UHMWPE, and polished alumina against itself. Frictional torque was also evaluated for each system at various levels of applied loads. A walking load history was used in both the frictional heating and torque tests. The majority of tests were performed with 5 mL of water lubricant. However, the effect of various concentrations of hyaluronic acid was also evaluated. Results showed frictional heating to occur in all three systems, reaching an equilibrium after roughly 30 min articulation time. Additional study results are discussed. (Edited author abstract) 21 refs.

**086495 SILICONE RUBBER TEMPOROMANDIBULAR JOINT (TMJ) MENISCAL REPLACEMENTS: POSTIMPLANT HISTOPATHOLOGY AND MATERIAL EVALUATION.** Medical grade silicone rubber has long been considered a suitable meniscal replacement, but there has been increasing concern about migration of this material into adjacent tissues. The objectives of this study were to determine the definitive composition of tissue-incorporated material which is presumed by light microscopy to be silicone and to identify long term histopathologic sequelae of meniscal replacement. Adult female patients underwent meniscectomy and replacement with silicone rubber (Silastic) implants. After 12 to 18 months, recurrence of symptoms in 8% of these cases led to implant removal with excision of peri-implant fibrous pseudocapsules. Excised tissues, including one preauricular lymph node and implants were submitted for light microscopy, SEM, and energy dispersive X-ray microanalysis (EDX) for the identification of elemental composition, critical surface tension measure-

ment, and internal reflection-infrared spectroscopy. EDX revealed prominent peaks for silicon in both pseudocapsular and nodal tissues. Morphological findings surrounding the long-term implants included foreign body reaction synovitis, dystrophic calcification, fibrocartilaginous metaplasia, hyalinization, and scarring. (Edited author abstract) 11 refs.

**086496 COMPONENT WEAR OF TOTAL KNEE PROSTHESES USING Ti-6Al-4V, TITANIUM NITRIDE COATED Ti-6Al-4V, AND COBALT-CHROMIUM-MOLYBDENUM FEMORAL COMPONENTS.** A knee simulator was used to study the wear of carbon fiber reinforced UHMWPE (Poly Two) tibial and patellar components against Ti-6Al-4V, titanium nitride (TiN)-coated Ti-6Al-4V, and cobalt-chromium-molybdenum femoral components. The prostheses tested were regular sized Miller-Galante total knees mounted on 316L stainless steel fixtures using bone cement. The wear mechanisms found on the tibial components were scratching, carbon-fiber associated damage, surface deformation, pitting, minor abrasion, and delamination. Three forms of carbon fiber associated damage were identified; fibers pulled from the surface, broken fibers, and UHMWPE removed from the surface fibers. The SEM evaluation revealed a pit forming mechanism. Additional study results are discussed. (Edited author abstract). 24 Refs.

**086497 WEAR AND CONTACT STRESS STUDIES OF THE MINNS MENISCAL KNEE PROSTHESES.** This paper describes the results of wear testing and contact area studies of a R.J. Minns meniscal knee prosthesis and compares the results of previous work on wear and contact stress studies of other knee prosthesis designs. Although stresses that arise at the surface of the polyethylene meniscus components are large, after repetitive loading the contact area rises, as a consequence of plastic flow and creep, and they reduce to a fifth of the initial stress after 1 million cycles. Contact area studies show that asymmetrical loading of the meniscus give proportionally high stresses on the higher loaded meniscus and, at large values of flexion, have similar values to a more conforming but fixed polyethylene tibial component design of knee prosthesis. A. 4 Refs.

**086498 EFFECTS OF POLYMETHYLMETHACRYLATE EXPOSURE UPON MACROPHAGES.** The effects of polymethylmethacrylate (PMMA) exposure upon macrophage viability and function were studied in an attempt to determine what role these cells play in the loosening of cemented arthroplasties. P388D1 murine macrophage cell line was exposed to PMMA and polystyrene particles of similar size and concentration. DNA synthesis following exposure to PMMA or polystyrene was studied by [<sup>3</sup>H]thymidine incorporation. Macrophage function was studied by analyzing the ability of activated macrophages to kill mast cell targets following particle exposure. Our results demonstrate that exposure of macrophages to PMMA particles in vitro inhibits DNA synthesis and impairs their cytotoxic ability. Histologic examination revealed that macrophages phagocytose both PMMA and styrene particles, but the former eventually lyse these cells. Our studies suggest that the histologic appearance of macrophages and foreign body giant cells at the bone-cement interface may be secondary to a repetitive cycle of PMMA particle phagocytosis and cell death, similar to that found in a foreign body granulomatous response. (Author abstract). 34 refs.

**086499 GEOMETRY OF THE FIRST METATARSOPHALANGEAL JOINT.** This study aimed to define the articular geometry of the metatarsophalangeal (MTP) joint of the great toe. Embedded in resin blocks, five pairs of cadaveric first MTP joints (all from men) were sequentially cut in the sagittal plane with a milling machine, removing 0.5 mm of bone in each cut. The photographed cartilaginous outline of each cut was digitized against reference markers, which enabled a computer system to superimpose each outline in three dimensions. The intersesamoid ridge was found to be parallel to the lateral shaft. The peak of the ridge was just lateral to the midline of the MT head. The articular outline, through the ridge of each sample, was circular. The sample size is too small for the sizing of prostheses but it is adequate to study the geometry of the MTP joint. More data are needed for the accurate replication of a resurfacing prosthesis and understanding of joint kinematics. (Edited author abstract). 12 refs.

**086500 GEOMETRY OF THE HUMEROULNAR JOINT.** Clinical results with elbow prostheses have been disappointing. A detailed knowledge of elbow joint geometry and mechanics is necessary to improve prosthetic design. In this study, the humeroulnar articulation of four human cadaver elbows was examined using surface analytic methods. In this article, the location of the transverse axis of elbow flexion-extension is suggested in relation to well-defined landmarks, the medial and lateral epicondyles, and subsequently to the line connecting their most lateral points - the transepicondylar line. The geometry of the structures responsible for the carrying angle is discussed, as is the extent of cartilage-covered bearing areas of the lower humerus and upper ulna. Implications pertaining to prosthetic design and surgical technique resulting from this study are discussed. (Author abstract). 22 refs.

## Mathematical Models

**086501 STRUCTURAL MODEL FOR MOLDED THERMOPLASTIC ANKLE-FOOT ORTHOSES.** The structural response of a posterior leaf spring, ankle-foot orthosis (AFO) was studied both experimentally and with a simple theoretical model. The theoretical model, which was compared with other analytical solutions and experimental data, predicted the bending and twisting of the AFO due to unit loads. The simple theoretical model utilized beam equations and small deflection theory. Excellent agreement between test and predicted values was achieved, indicating that the simple theoretical model, which was relatively easy to implement computationally, could serve as the major component of a computer-aided design program. (Author abstract) 9 refs.

## Measurements

**086502 OPTO/COMPUTER METHODS APPLIED TO THE EVALUATION OF A RANGE OF ACETABULAR CUPS.** Non-contact optical measurements have been made for acetabular cups of both the Charnley (worn in vivo) and Stanmore (simulator worn) types. The measurements employ optical contouring as the technique for deriving point coordinates. Optical contouring consists of creating or projecting fringes of known spacing onto an object. Points lying on a line (fringe edge) are then known to be of the same height/depth from a particular reference). This paper shows the problems and solutions

of applying this technique to both knee and hip prostheses. 4 Refs.

## Myoelectric Control

**086503 MICROPROCESSOR BASED TRAINER FOR BOTH SINGLE-SITE AND TWO-SITE MYOELECTRIC PROSTHESES.** Electronic training aids are essential in preparing an amputee for the use of a myoelectric prosthesis, but are often complicated in use and never flexible enough to handle a wide variety of possible myoelectric control strategies. The Bio-Engineering Institute of the University of New Brunswick has designed a 'high-tech' training device, which overcomes these drawbacks. The new trainer interacts with a therapist via a 2x40 character liquid crystal display and two key switches. It is completely menu driven. By using low power circuitry throughout the design, the instrument can be run continually for up to 8 h off a set of five standard D-type cells. In addition, the instrument can be easily adapted to any new control strategy by an update to read-only-memory based software. (Edited author abstract) 7 refs.

**086504 MYOELECTRIC PROSTHESES: STATE OF THE ART.** A brief introduction to powered prosthetics and myoelectric control is presented. This paper reviews the present availability and clinical impact of myoelectric prostheses. A significant observation is that these systems have reached a sufficient degree of maturity that they are accepted by many health-care funding agencies as reasonable and cost-effective components of the rehabilitation process. The limitations of both the mechanical systems and the myoelectric controls are discussed in some detail, from the viewpoint of the potential user. Finally, an overview is given of current research in this field with comments on probable directions of development. (Edited author abstract). 10 refs.

**086506 KEY EVENTS IN THE EVOLUTION OF IMPLANTABLE PACEMAKER BATTERIES.** The successful development of implantable cardiac pacemakers has been facilitated by the merging of the relevant technologies in electronics and power sources. The mercury/zinc oxide battery was a key component in the initial development of implantable pulse generators and that battery system is closely associated with the name of Dr. Samuel Ruben. Subsequently, the lithium/iodine battery was developed for hermetically sealed, longer-lived pulse

generators, and this development has been closely associated with the name of Dr. Wilson Greatbatch. These inventors were able to assess the existing technology and make improvements and innovation as required to achieve a product that satisfied the need. The present chapter records interviews that occurred in January 1983; the purpose was to explore these individuals' thoughts on the subject of creativity in general and their experiences in being so innovative in the area of power sources. 8 refs.

**086507 PHRENIC PACEMAKER: SUBSTITUTION OF PARALYZED FUNCTIONS IN TETRAPLEGIA.** Electrophrenic respiration - the control of respiration by proper stimulation of phrenic nerves - was first discussed in a publication by S.J. Sarnoff in 1948. Unlike the cardiac pacemaker, however, the respiratory pacemaker has had no significant success in recent years. Perhaps the only modest progress in this field has been a result of the electrically induced fatigue of the nerve-muscle complex. The aims of this study are concerned with the modern rehabilitation of patients with quadriplegia and respiratory insufficiency who have been implanted with the authors' respiratory pacemaker. Subjects covered include preclinical stage studies. Stability of impedance and threshold, clinical experience, and others. 11 refs.

**086508 CHOOSING AN ELECTRONIC CARDIAC PACEMAKER: A DECISION ANALYSIS.** Cardiac pacemaker malfunctions are of continuous concern to the medical profession as well as to the electronics industry. This paper employs a decision analytic framework to help cardiologists choose among several pacemaker models. Failure data were obtained from the literature and a utility function over failure outcomes was elicited from a cardiologist. The paper presents a 'Batch Reliability Comparison' method for utility assessment which might also be attractive in other reliability settings. Three specific pacemaker models were evaluated. The expected utility approach yielded a different ranking than the conventional expected life approach. (Edited author abstract) 4 refs.

**086509 ANALYSIS OF THE CURRENT-DENSITY DISTRIBUTION FROM A TAPERED, GELLED-PAD EXTERNAL CARDIAC PACING ELECTRODE.** We have designed a high-temperature (5000  $\Omega$ -cm), tapered, gelled-pad, external cardiac pacing electrode that limits the migration of charges to the perimeter of a circular electrode and produces a more uniform current-density distribution than external cardiac pacing electrodes in clinical use. A computer simulation was developed that uses cylindrical coordinates to analyze the current-density distribution at the interface between the electrode and human tissue. Our computer simulation analyzed 32 different electrodes, and the results showed that the gelled-pad thickness, the gelled-pad taper, and the radius of the conducting disk were not significant parameters in determining the current-density distributions for low-resistivity electrodes. Those parameters were, however, significant for high-resistivity electrodes. The peak current density of the tapered, gelled-pad electrode was 50% lower than that of the clinically available electrodes, while delivering 58% more current to the human tissue. (Edited author abstract) 11 refs.

**086510 FUNCTIONAL TESTING OF EXTERNAL**

**CARDIAC PACEMAKERS.** In common with all other biomedical equipment, cardiac pacemakers should be routinely tested and serviced. Experience has shown that although they are generally very reliable, some faults have occurred that might have been detected by regular testing. A testing protocol is suggested that has two levels, routine tests that check the essential functions of the pacemakers and supplementary tests that check those parameters which are less likely to be of immediate clinical significance. The measurement details and rationale of the tests are described in some detail. Finally, a preliminary evaluation of a test instrument which has been developed specifically for these procedures shows that it is rapid and easy to use and allows a more rigorous standard of testing to be achieved. **086511 FREQUENCY SPECTRA OF VENTRICULAR TACHYCARDIA AND SINUS RHYTHM IN HUMAN INTRACARDIAC ELECTROGRAMS - APPLICATION TO TACHYCARDIA DETECTION FOR CARDIAC PACEMAKERS.** Presently available antitachycardia pacemakers detect ventricular tachycardia (VT) by measurement of the period of the intracardiac electrogram (EGM). The resulting inability to differentiate between VT and rapid normal sinus rhythm (NSR) can cause inappropriate pacemaker output, possibly initiating an arrhythmia where none existed previously. It is reported that FFT analysis of matched-pair NSR-VT EGM recordings from 33 patients revealed a mean ( $\pm$ S.D.) NSR-VT difference in the peak amplitude point of  $8 (\pm 7)$  Hz and a difference of  $18 (\pm 18)$  Hz in the  $-3$  dB point. NSR-VT amplitude differences could be significantly increased by filtering over the range of greatest spectral differences. Variable-passband programmable filters could enhance VT detection in antitachycardia pacemakers. 16 refs.

## Plastics Applications

**086512 POLYMERS ON THE PITCH.** The author outlines three kinds of ligament replacements: permanent - implanted prostheses, which stay in the body; inductive - these allow collagen to grow in and around them and act as a scaffold for a new ligament or tendon (a neoligament); resorbable - these act as a temporary scaffold, eventually biodegraded by the body. Among the replacement materials discussed by the author are carbon fiber, polyesters and PTFE. Also presented are the properties of the ideal prosthetic material.

**Transplantation** See Also BIOMEDICAL EQUIPMENT; COMPUTER SOFTWARE—Medical Applications.

**086513 BRIDGE TO HEART AND LUNG TRANSPLANTATION: PA TO LA SHUNTING WITH AN INTERPOSED RECIRCULATION CIRCUIT FOR OXYGENATION.** The authors have designed a system that allows for pulmonary artery (PA) to left atrium (LA) shunting with an interposed recirculation circuit for oxygenation as a bridge to heart-lung transplantation. PA to LA shunting can effectively reduce the PA pressure and relieve the pressure load of the right ventricle in conditions of primary or secondary pulmonary artery hypertension. This study succeeded in doing total PA to LA shunting with oxygenation for 13 hours. Although this procedure is more invasive than ordinary ECMO, it may be useful as a temporary assistance device in those candidates awaiting heart-lung transplants. 3 refs.

**086514 RIGHT HEART ASSIST FOR ACUTE**

**RIGHT VENTRICULAR FAILURE AFTER ORTHOTOPIC HEART TRANSPLANTATION.** Fixed high pulmonary vascular resistance (PVR) is a major contraindication to orthotopic heart transplantation, and patients with this condition are usually excluded during preoperative evaluation. Nevertheless, those with normal or slightly elevated PVR can develop acute right ventricular failure as a result of right ventricular afterload mismatching caused by a spastic reaction of the pulmonary vasculature. Right ventricular dysfunction may be fatal if functional improvement and/or decrease of resistance is not achieved. This report concerns such a patient, in whom right heart bypass (RHB) was used to maintain the systemic circulation. The patient was eventually weaned successfully but died 2 weeks later of septicemia and multiple organ failure. The paper concludes that when acute right ventricular failure follows orthotopic heart transplantation and the patient does not respond to medical therapy, RHB may be useful for overcoming transient right heart dysfunction caused by temporarily elevated afterload. 10 refs.

**086515 EPIPHYSEAL REPLACEMENT USING DEVELOPING TISSUE DONORS IN A MURINE MODEL: A COMBINED HISTOLOGIC AND RADIOGRAPHIC STUDY.** The purpose of this experiment was to develop such a model of epiphyseal transplantation in the mouse. Developing CD1 mouse or Lewis rat limb tissue was used to replace the knee tissue that had been resected from CD1 postnatal mouse hosts. Donor tissue ranged from 14-day embryonic mouse to 9-day postnatal mouse or 18- and 19-day fetal rat, which has a gestation similar to the mouse. The murine tissue is known to be avascular prior to the sixth postnatal day. The limbs were analyzed radiographically and histologically. The results show that epiphyseal replacement could be studied using developing tissue donors in a murine model. The results suggest that donor tissue prior to vascularization and tissue combinations with the least developmental time mismatch (the least heterochronicity) produced relatively the best, although still abnormal epiphyses. (Edited author abstract) 20 refs.

**086516 PROTECTIVE CAPACITY OF ZINC SILICATE COATINGS IN DAMAGE OF THEM.** In anticorrosion protection of hydraulic structures and also of ship hulls in service under complex Arctic conditions mechanical damage of coatings and wear of them until uncovering of large areas of metal are possible. Silikat-sink-2 (STs-2), Silikat-sink-01 (STs-01), and Silikat-sink-02

(STs-02) coatings, the zinc content in which is 80, 75, and 60%, respectively, were investigated. The specimens were shot-blasted plates of 08 steel. The coating thickness was 80  $\mu\text{m}$ . The corrosive medium was sea water. Despite cleaning until uncovering of the surface of the base, it is not possible to completely eliminate the zinc. Particles of it remain in the depressions of the surface occurring in shot-blasting. The zinc deposited in the depressions provides protection for 210 days and traces of corrosion are not observed. 4 refs.

**086518 DISTRIBUTION OF TEMPERATURE AND HEAT FLUX AT THE CONTACT OF THE SUBSTRATE WITH A SUBLAYER DURING ELECTRIC-ARC DEPOSITION OF PROTECTIVE COATINGS.** Results of mathematical modeling of the temperature state of a substrate-sublayer system during deposition of protective coatings by the electric-arc method are presented. The thermal effect of the coating particles on the free surface of the sublayer is assumed to be equivalent to heating of this surface by a heat flux of a given power. The authors will assume that the substrate and sublayer have the same initial temperature and that the thickness of the substrate considerably exceeds the thickness of the sublayer. 1 ref.

Mrochek, Zh.A.; Antonenko, A.B.; Vershina, A.K. *Sov Surf Eng Appl Electrochem n 1 1987 p 28-31.*

**086519 INTENSIFICATION OF THE ELECTROSPARK ALLOYING PROCESS IN A MEDIUM OF LOW-MELTING SURFACE-ACTIVE METALS.** The effect of low-melting surface-active metals (SAMs) on the technological characteristics of electrospray alloying (ESA) was investigated. It is shown that, depending on the treatment conditions and absorption activity of the SAMs, both plasticizing and embrittling effects are observed, which can be used for controlling the process of transport and erosion of the metal during ESA. It was established that the main cause of limitation of the thickness of the alloyed layer is its limiting energy saturation, which can be reduced by the plasticizing effect of SAMs. Modification of the substrate by surface-active melts makes it possible to increase by 2-2.5 times the rate of metal transport with an increase of the transport coefficient by 20-35%. (Edited author abstract) 8 refs.

**086523 COATINGS FOR PERFORMANCE RETENTION.** This article reviews both progress and challenges in three areas: wear-resistant coatings, erosion-resistant coatings and coatings for seal systems. For many years, wear-resistant coatings have been used in fans and compressors to minimize wear from impact, fretting, or galling. Airfoil and blade tip coatings have been used to combat erosion problems in the fan and compressor as well as erosion problems resulting from combustor deterioration, but considerable room for improvement remains. In the area of seal systems also, while significant improvements have been made in materials for compressors, labyrinth seals, and turbine gas path seals, there remains much to be done. (Edited author abstract) 3 refs.

Hillery, Robert V. (Coating & Seal Systems). *Leading Edge (Evendale OH) Spring 1987 p 36-41.*

**086524 LES REVETEMENTS CERAMIQUES: OUTILS DE DEVELOPPEMENT TECHNOLOGIQUE.** [Ceramic Coatings: Tools of Technological Development]. Ceramic coatings, whose role is less apparent than that of the metallic coatings, have played an important part in the technological development. The principal coating processes that are described in the article have made it possible to overcome considerable technological barriers in the field of optics, electronics, wear, and high temperatures. Introduction of new technologies or putting new materials into service can necessitate adaptation of some current procedures or resorting to procedures that have not yet found wide application. (Translated author abstract) In French. 43 refs.

**086526 NEW WORLD OF FINISHING. URETHANES - PART II.** The basic chemical ingredient of the urethane enamels and coating materials covered in Part I last month emphasized the environmental problems associated with the isocyanates. A second environmental problem with the urethanes is the solvents required to be used with them. Research is centering on a number of ways to produce single part urethanes which offer properties as good as their solvent counterparts. The article lists the important properties needed for a coating for a typical urethane which could be used over an epoxy primer, a lacquer primer or by itself on a metal substrate. 1 ref.

Groshart, Earl. *Met Finish v 86 n 3 Mar 1988 p 33-34.*

**086527 SPECIAL EQUIPMENT REQUIREMENTS FOR SPRAY FINISHING WITH COMPLIANCE COATINGS.** The trend toward greater use of compliance coatings has affected both suppliers and end users of all types of coatings. As industrial finishers have been faced with more stringent EPA guidelines for low VOC (volatile organic compound) emissions, they have turned to their paint suppliers for new formulations which will meet these requirements. The result has been development and formulation of various new liquid compliance coatings such as high solids coatings, waterborne coating and coatings formulation which utilize compliant solvents. The change to higher levels of solids and the wide range of solvents and formulation bases (e.g. waterbornes) have highlighted the need for special equipment to effectively apply these new materials.

Bain, R. Clark (Graco Inc, Minneapolis, MN, USA); Muir, Glen. *Met Finish v 86 n 3 Mar 1988 p 55-57.*

**086528 KORROSIONSSCHUTZ DURCH CHEMISCH ABGESCHIEDENE NICKELUEBERZUEGE.** [Corrosion Resistance by Chemically Deposited Nickel Coatings]. An investigation of the chemical resistance of chemical nickel coatings with more than 10 per cent of phosphorus shows that they are resistant in a range of media, including among others, the various materials employed in the food industry. Their application depends, however, on the corrosion resistance of the system as well as the chemical resistance. The corrosion resistance depends, apart from the chemical resistance, on the basis material, the pre-treatment, the coating technology, the coating thickness, and various other factors. Guidelines are given for the use of chemical nickel for corrosion protection. (Author abstract) 15 refs. In German.

**086530 ECONOTECHNICAL ANALYSIS OF CLEAR COATINGS - VALUE IN USE.** The selection of UV/EB technology as a clear coating is no longer limited to situations determined by external environmental and mechanical considerations. There are now applications where coating selection is made on the basis of the cost/performance analysis of the coating itself. There are 'real' advantages and UV/EB systems are leveraged. In order to sustain the growth that radiation-cured clear coatings have enjoyed, we will have to look to other areas for that growth. The time is coming soon when a change to UV/EB coatings will no longer be required, but will have to be earned on a competitive basis.

**086531 PAPERS PRESENTED AT THE 14TH INTERNATIONAL CONFERENCE ON METALLURGICAL COATINGS.** This conference proceedings is distributed between two journals: 'Surface and Coating Technology' and 'Thin Solid Films'. The two volumes of 'Surface and Coating Technology' contain 73 papers on metallurgical coatings, three of which appear as extended abstracts. The first of these volumes covers the conference sessions devoted to: corrosion resistant coatings and materials development; clearance control and high temperature applications; and thermal barrier coatings. The main topics of the second volume include: hard coatings; tribological coatings and surface modifications; industrial coating equipment and applications; and surface modification using direct ion beams. The second part of the conference proceedings is packaged under Code No. 10820. Technical and professional papers from this conference are indexed and abstracted with the conference code no. 10819 in the Ei Engineering Meetings (TM) database produced by Engineering Information, Inc.

#### Acoustic Emission Testing

**086532 ACOUSTIC EMISSION MEASUREMENTS TO EVALUATE THE DEGRADATION OF COATING FILMS.** Two types of acoustic emission (AE) have been observed during cathodic degradation of coating films. Under a cathodic polarization of very low overpotential at which no hydrogen gas evolved, intermittent AE signals with long intervals were observed. This type of AE measured should be responsible for a chemical and/or physical breaking of the bond between the metal and the film. Therefore, early stage evaluation of films will be performed by this type of experiment. The second type of AE was measured under higher overpotential. The formation of hydrogen gas bubbles caused this type of AE. Thus, it is possible to detect the existence of water layers or small blisters under the film by a cathodic polarization of coated steels and simultaneous AE measurement. (Edited author abstract) 11 refs.

#### Analysis

**086533 PHASE COMPOSITION OF DETONATION COPPER-MOLYBDENUM DISULFIDE COATINGS.** The present work involves the investigation of the phase composition of coatings made from different mechanical mixtures of copper with molybdenum disulfide and sprayed on with different compositions of the detonating gas mixture. Radiographic analysis of the distribution of molybdenum disulfide over the surface of flat specimens showed that here the molybdenum disulfide is distributed nonuniformly. As had been assumed, in a number of specimens its largest amount is found in the central part of the surface of the specimen corresponding to the core of the spraying spot, and in some specimens the maximum lies in the peripheral part of the spraying spot, i.e., in the zone with the minimal thickness of the coating. This circumstance has to be taken into account in the spray-coating of extended surfaces and in matching the feed of the coated surface to the spraying spot. 5 refs.

**086534 FROM DIAMOND-LIKE CARBON TO DIAMOND COATINGS.** Coatings which have a high degree of sp<sup>3</sup> bonding generally have properties, especially hardness, close to those of single-crystal diamond and are

often referred to as diamond-like carbon. Recently, large grain size diamond crystals and continuous diamond coatings have been prepared by plasma chemical vapor deposition methods. Although such materials are different from the diamond-like carbon class of materials, there is clearly a continuum of materials which is expected to lead to vagueness and confusion in nomenclature. In this paper, such issues are dealt with and a working definition of 'diamond' coatings is offered. (Edited author abstract) 39 refs.

**Applications** See Also COATINGS—Reviews; STEAM TURBINES—Blades; TEXTILE MACHINERY—Protective Coatings.

**086535 COATINGS COMPATIBLE WITH MOIST, OILY, RUSTY SURFACES.** Although the ultimate performance of most coatings will depend to a large extent on the surface preparation of the substrate, there are many instances in maintenance painting, especially in the oil and process industries, where high standards of surface preparation by abrasive blasting are not possible. New resin and coating technology has been developed by scientists from the British Petroleum Research Center in response to an even greater need for more surface-tolerant coatings. The coating can be applied over marginal surfaces without abrasive blasting, even though surfaces are contaminated with oil. The author describes these coatings which are compatible with moist, oily and rusty surfaces.

**086536 APPLICATION AND QUALITY CONTROL OF FUSION BONDED EPOXY COATINGS.** The performance of mill-applied fusion bonded epoxy coatings in pipe service is dependent upon surface preparation and application procedures. The author focuses on measures to control the quality of application. FEB coating is widely used on oil and gas pipelines where high quality corrosion protection is a priority. FEB coatings provide superior performance, and when coated to the requirements of published standards, provide a high quality coating that is compatible with the cathodic protection system required on these pipelines. 13 refs.

McConkey, S.E. (Shaw Pipe Protection Ltd). *J Prot Coat Linings* v 5 n 5 May 1988 p 26-31.

**086537 MANAGING PROTECTIVE COATINGS PROJECTS.** Protective coatings are necessary in any large chemical complex. Otherwise, the chemicals used in processes and the atmosphere around the plant will corrode and/or erode the structural steel, tanks, pumps, motors, and other equipment to the point where replacement is required in a very short time. But the coatings themselves do not solve corrosion problems. Sound engineering judgment and practices are required to assure that the proper materials are selected, that well written specifications appropriately govern the conduct of the work, that competent contractors are selected to apply the coatings, and that the work is conducted efficiently and professionally. This article focuses on the management of painting projects, with the aim of describing sound practice in all of the activities necessary to a successful painting project. 5 refs.

#### Cavitation Corrosion

**086540 EFFECTS OF PLATING ON CAVITATION EROSION.** To study the cavitation erosion behavior of interfaces and base metals used for plating, magnetostrictive erosion tests were carried out in a 3% NaCl solution using a structural carbon steel specimen plated thinly with zinc, tin, chromium or nickel. When erosive attack extends to the interface between the plating and the base metal, forms a rough surface because of the large difference in hardness and electrochemical corrosion between the plating and the base metal, even though it shows high erosion resistance in itself. Thus the protective effects of a thin and hard plating are lost immediately. However, a zinc plating or a thin plating which is underplated with copper becomes effective because of the electrochemical reactions of the plating layer that remains on the surface outside the eroded region. (Author abstract) 7 refs.

**086542 DAS TD-VERFAHREN: EIN NEUES VERFAHREN ZUR CARBIDBESCHICHTUNG, SEINE DURCHFUEHRUNG UND PRAKTIISCHE ANWENDUNG.** [TD-Process: A New Carbide Coating Method, its Implementation and Practical Application]. In recent years three new processes for depositing thin carbide or nitride films have been developed, namely, the PVD (Physical Vapor Deposition) process, the CVD (Chemical

Vapor Deposition) process, and the TD-process. The latter, developed in 1971 by the Toyota Central Research and Development Laboratories, Inc., is a special carbide coating process characterized by simple operation, which is similar to the conventional treatment of steel in salt solutions. The facilities necessary for this process are also very simple and correspond to those used in salt solution processes. (Translated author abstract) In German. 11 refs.

Arai, Tohru. *TZ Metallbearb* v 80 n 3 Mar 1986 p 27-32.

**086543 CHARACTERIZATION OF PLASMA-SPRAYED ALUMINA-ZIRCONIA COATINGS.** Microstructures of two  $\text{Al}_2\text{O}_3$ -12 mol% $\text{ZrO}_2$  composite powders prepared by blending and fusing, respectively, were investigated by means of X-ray diffraction and laser-Raman spectroscopy before and after plasma spraying. The results obtained were as follows: The structural behavior of the B-coating was almost the same as that of a single alumina or zirconia coating prepared by plasma spraying. The T- $\text{ZrO}_2$  phase was predominant in the B-coating and was a metastable phase as the result of plasma spraying. The laser-Raman microprobe measurement indicated that the transformation behavior in the B-coating caused by a Vickers indentation was observed in the central area and around cracks of an indent due to stress concentration. In the F-coating the  $\alpha$ - $\text{Al}_2\text{O}_3$  phase was mostly retained after plasma spraying, while a large amount of the m- $\text{ZrO}_2$  phase was formed. These results indicate that the microstructure of the alumina-zirconia coatings are dependent on the state of the starting ceramic powders. (Edited author abstract) In Japanese. 19 refs.

**086544 UNLUBRICATED SLIDING WEAR OF CERAMIC MATERIALS.** The potential use of thermal insulating ceramic coatings on the cylinder walls of diesel engines at elevated temperatures requires that an understanding of the operative friction and wear mechanisms be gained. An investigation was carried out to determine the unlubricated sliding wear behavior of a thermal insulating oxide coating in combination with a number of carbide, boride, and mixed oxide coatings at room and elevated temperatures to 730°C. The coatings were applied up to several hundred micrometers thick by plasma spray and chemical vapor deposition (CVD) processes. It was found that the binder metal in sprayed metal-carbide composites had a dominant influence on the wear, more so than the composition of the carbide. Different wear surface morphologies and attendant wear rates occurred at each of the test temperatures. The shape of the deposited grains in the CVD coatings had a major effect on the wear rates; rounded grains being better than angular grains of the same material. (Edited author abstract) 1 ref.

Levy, Alan V. (Lawrence Berkeley Lab, Berkeley, CA, USA); Jee, Nancy. *Wear* v 121 n 3 Feb 1 1988 p 363-380.

**086545 EIGENSCHANNUNGEN, HAFTFESTIGKEIT UND VERSCHLEISSEIGENSCHAFEN VON GESPUTTERTEN, AMORPHEN ALUMINIUMOXIDSCHICHTEN.** [Internal Stresses, Adhesion and Wear Behavior of Sputtered Amorphous Alumina Coatings]. Thin alumina coatings have been produced by means of reactive RF magnetron sputtering. The layers, deposited on metallic substrates, show an amorphous crystallographic structure, which may be due to the low deposition temperatures below about 250°C. Measurement of internal stress was performed by using the bending-beam method. The experiments show that there is not only a dependence on the film thickness but even pressure and sputtering power have a strong influence on the internal stresses of the alumina coatings. Some correlations between internal stress and adhesion of the coatings are evident. Besides scratch-test measurements, the layer removal behavior of the bending-specimen gave information about the adhesion of the coatings. The results of the two methods are in good agreement. Some of the alumina coatings were tested with regard to their tribological behavior by means of a model testing apparatus. The coatings show excellent

wear behavior even under severe tribological conditions. (Edited author abstract) In German. 9 refs.

Roth, Th.; Broszeit, E.; Kloos, K.H. *Z Werkstofftech* v 18 n 11 Nov 1987 p 375-380.

**086546 ELECTROCHEMICAL METHOD TO EVALUATE THE CONNECTED POROSITY IN CERAMIC COATINGS.** The electrochemical behavior of plasma-sprayed SS41 steels with the  $\text{Al}_2\text{O}_3$ - $\text{TiO}_2$  system,  $\text{Cr}_2\text{O}_3$  and  $\text{ZrO}_2$  stabilized by  $\text{Y}_2\text{O}_3$  ceramics was studied using a potentiostat by measuring their natural potential and anodic polarization curves in 3.5% NaCl aqueous solution. The natural potential of ceramic-sprayed SS41 steels is the same as that of the substrate. The anodic polarization behavior of ceramic-sprayed SS41 steels is also dominated by the substrate through connected porosity. The strong relation between the connected porosity and the porosity of cross-sections of the ceramic coatings, shown using micrographs, was recognized. By measuring electrochemically the connected porosity in coatings obtained under various spraying conditions, it would be possible to select the optimum spraying conditions to spray coatings which have less porosity. (Edited author abstract) 4 refs.

**086547 THERMODYNAMIC AND EXPERIMENTAL STUDY OF CVD OF NON-STOICHIOMETRIC TITANIUM NITRIDE FROM  $\text{TiCl}_4$ - $\text{N}_2$ - $\text{H}_2$  MIXTURES.** Using the polynomial description of the Gibbs free energy of formation of titanium nitride against its composition, thermodynamic deposition diagrams were determined at 1900 K. Deposition rates and composition of the film were studied. The cold wall reactor is associated with a dew point evaporator. At 1900 K, on a molybdenum substrate, experiments carried out as a function of input nitrogen, temperature and pressure, confirmed the theoretical trends. The different deposition mechanisms in relation to total pressure are thermodynamically related with a progressive reduction of the halide to solid titanium under one atmosphere instead of a major formation of gaseous titanium under  $6.6 \times 10^{-3}$  atm. The lowest N/Ti value obtained in the deposits is 0.63. (Edited author abstract) 21 refs.

Teyssandier, F. (CNRS, Perpignan, Fr); Bernard, C.; Ducarroir, M. *J Mater Sci* v 23 n 1 Jan 1988 p 135-140.

**086548 CHARACTERISTICS OF METAL ELECTROPLATING TO PLASMA SPRAYED CERAMIC COATINGS.** The characteristics of electroplating a metal onto  $\text{Al}_2\text{O}_3$  and  $\text{ZrO}_2$  coatings themselves sprayed by plasma onto mild steel, were investigated. It was recognized that copper plating along the porosities connected to the substrate started from the interface between the ceramic coating and the substrate. The microphotographs show that the nonbonded area between flattened ceramic particles in the coating can be filled up with copper. The plating of copper into coatings depends greatly on the shape and the size of the porosities in the coating, which are determined by the ceramic type and spraying conditions. Moreover, they are affected greatly by electroplating conditions such as current density. It is possible to obtain composite coatings of metals and ceramics by the composite processing of both thermal spraying and electroplating, which can improve the coating properties and suppress completely corrosion of the substrate. (Edited author abstract) 7 refs.

**086549 SVILUPPI ED APPLICAZIONI DEI DEPOSITI CERAMICI PRODOTTI COL METODO CVD.** [Developments and Applications of CVD Ceramic Coatings]. The Chemical Vapour Deposition (CVD) technique is increasingly used to produce layers of ceramic compounds to modify the surface properties of metal, ceramic or polymeric components for specialised conditions or in severe conditions of use. Carbides, nitrides,

oxides, silicides, borides, etc., have been deposited in the most varied supports to solve problems of high temperatures, erosion, corrosion, diffusion and conductivity or electrical resistance. CVD is quite versatile and allows a great variety of deposits. It is characterised by great penetrating power and can cover uniformly pieces with complicated shapes, with cavities and porosities. It allows deposits which are firmly anchored and with controlled purity. (Edited author abstract). 39 Refs. In Italian.

Brossa, F. (Commissione delle Comunità Europee, Ispra, Italy). *Ceramurgia* v 18 n 1 Jan-Feb 1988 p 28-33.

**086550 SINTERING STUDIES OF PLASMA-SPRAYED ZIRCONIA.** Several studies have shown the benefits of plasma-sprayed ceramic coatings of zirconia in producing enhanced performance or extended life capabilities in gas turbine engines. This study examines the rate and magnitude of sintering in plasma-sprayed zirconia vs. time (1-24 h), temperature exposure (1038-1510°C) and silica impurity level (0.2%-4.0%). Mechanical property changes (up to 3.5 times the original strength and four times the original modulus) are shown to be associated with sintering. Significant effects of sintering on the mechanical properties of the sprayed material are seen at temperatures as low as 1100°C. The discussion includes effects of impurity level, microstructural morphology and stabilizer concentration. 13 refs.

**086551 HIGH TEMPERATURE EROSION BEHAVIOR OF TUNGSTEN- AND CHROMIUM-CARBIDE-BASED COATINGS.** This study was undertaken to obtain a better understanding of the erosion mechanisms occurring in currently used materials to serve as a baseline for development of coatings with improved erosion resistance. Coatings made using a mechanical mixture of chromium carbide and nichrome were compared with tungsten-carbide-base materials made with pre-alloyed nickel and cobalt metal matrices. Erosion data were obtained at temperatures up to 1400°F at angles of impact of 30° and 90° with an alumina erodent carried in a heated gas stream. Erosion scars were studied using a scanning electron microscope and evaluated in the light of optical metallography of the coating's structure. An attempt was made to interpret the data in the light of existing erosion theory. (Edited author abstract) 5 refs.

**086552 FRICTION AND WEAR BEHAVIOR OF CHROMIUM CARBIDE COATINGS.** Chromium carbides, tungsten carbide and chromium oxide have been tested and evaluated as coatings to protect high temperature gas-cooled reactor (HTGR) steam generator and other HTGR components from adhesion, galling associated with sliding wear or from fretting. Several types of chromium carbide coatings including  $\text{Cr}_3\text{C}_2$ ,  $\text{Cr}_7\text{C}_3$  and  $\text{Cr}_{23}\text{C}_6$  were tested for wear resistance and resistance to long-term spalling. Tungsten carbide and chromium oxide coatings were tested in sliding wear tests.  $\text{Cr}_{23}\text{C}_6$ -NiCr coatings showed the best performance (from 400 to 816°C) whether they were applied by detonation gun or plasma gun spraying methods. (Edited author abstract) 13 refs.

**086553 CHARACTERIZATION AND THERMAL SHOCK TESTING OF YTTRIA-STABILIZED ZIRCONIA COATINGS.** Industrially manufactured partially stabilized zirconia thermal barrier coatings were

characterized and tested. Optical microscopy tests were employed for qualitative and quantitative characterization of the coating structures as sprayed and after testing. Particular emphasis was given to the porosity of the ceramic coatings with regard to the size, shape and distribution of the pores by use of an interactive image processing system. In addition, the nature and quantity of phases in the ceramic coatings were determined using X-ray diffraction analysis. Thermal shock resistance was detected by burner rig tests. (Author abstract) 5 refs.

Steffens, H.-D. (Univ of Dortmund, West Ger); Fischer, U. *Surf Coat Technol* v 32 Dec 1987, Pap Presented at the 14th Int Conf on Metall Coat - Part 1, San Diego, CA, USA, Mar 23-27 1987 p 327-338.

**086554 DEGRADATION MECHANISMS OF THERMAL BARRIER COATINGS IN BENDING TESTS.** The strain tolerance of thermal barrier coating (TBC) systems is limited by the properties of the ceramic coating. In this paper a bending test combined with acoustic emission measurements is described. The results show the ability of the method to investigate the degradation mechanisms of the ceramic TBC that result from mechanical loading. In addition, the possibility of conditioning the coating system by heat treatment is discussed. (Edited author abstract) 7 refs.

**086555 HOT CORROSION STUDIES OF ZIRCONIA CERAMICS.** The corrosion of stabilized zirconia ceramics by vanadic salts at 700-900°C was investigated to elucidate the mechanisms of attack, and to determine the effects of the chemical reactivity of the stabilizing oxide ( $\text{CeO}_2$ ,  $\text{Y}_2\text{O}_3$ ) and of the physical structure of the zirconia (sintered, rapidly solidified (RS), single crystal (SC)). The SC and RS zirconias were less degraded in molten  $\text{NaVO}_3$  than was sintered zirconia. The results are discussed in terms of understanding ceramic molten salt corrosion, and the development of corrosion-resistant stabilized zirconias. Stabilized zirconia ceramics are being developed for use as blade coatings in gas turbines. 10 refs.

**086556 PHILOSOPHY FOR THERMAL BARRIER COATING DESIGN AND ITS CORROBORATION BY 10,000 h SERVICE EXPERIENCE ON RB211 NOZZLE GUIDE VANES.** In considering the use of thermal barrier coatings (TBCs) in aero gas turbine engines, several potential design philosophies can be considered. Rolls-Royce has used ceramic thermal barrier coatings (TBCs) in jet engine combustors for well over a decade and on turbine nozzle guide vane platforms (RB211-535E4) and aerofoils (RB162) for several years. Much work has been done to characterize and improve TBC systems for use in more aggressive engine applications. The philosophy and some of the studies performed are reviewed in this paper to understand better the failure mechanisms which govern coating life in service. Findings are correlated with relatively simple laboratory rig test evaluations and with a rainbow service trial involving over ten thermal barrier systems. Some of these systems have been inspected after close to 10,000 flying hours (5000 cycles) and found to be in near-perfect condition. 20 refs.

**086557 THERMIONICALLY ASSISTED PLASMA ASSISTED PHYSICAL VAPOUR DEPOSITION OF STABILIZED ZIRCONIA THERMAL BARRIER COATINGS.** Since the mid 1970s, ceramic thermal barrier coatings (TBCs) have been used in the turbine combustors and afterburners of several commercial

aero-engines. In this work, yttria partially stabilized zirconia has been deposited under a range of process conditions, by both electron beam physical vapor deposition (EBPVD) and radio-frequency plasma assisted (PA) PVD. The addition of thermionic assistance to the above techniques was also investigated. The effects of plasma assistance, thermionic assistance, pressure, surface finish and source-to-substrate distance on structure, phase, uniformity and adhesion are reported. PAPVD alone was found to improve adhesion and permit control of coating structure and densification over more conventional EBPVD coatings. The addition of thermionic emission for both PAPVD and EBPVD results in further improvements in adhesion and coating densification. 10 refs.

James, A.S. (Univ of Hull, Hull, Engl); Fancey, K.S.; Matthews, A. *Surf Coat Technol* v 32 Dec 1987, Pap Presented at the 14th Int Conf on Metall Coat - Part 1, San Diego, CA, USA, Mar 23-27 1987 p 377-387.

**086558 CERAMIC THERMAL BARRIER COATINGS WITH IMPROVED CORROSION RESISTANCE.** Ceramic thermal barrier coatings (TBCs) are increasingly being applied to aircraft gas turbine combustors and afterburners. A method for limiting the ingress of corrosive species into physical vapor deposited zirconia thermal barrier coatings by inserting dense ceramic sealing layers into the usual columnar (segmented) ceramic microstructure has been examined. The concept was evaluated by sputtering a series of  $\text{ZrO}_2\text{-}20\text{Y}_2\text{O}_3$  deposits onto In792 substrates coated with a  $\text{CoCrAlY}$  bondlayer. In each coating the majority of the ceramic layer was deposited with a porous columnar (segmented) microstructure. This microstructure provided the ceramic with excellent tolerance to thermal cycling. The use of intermediate sealing layers has been shown to block the infiltration of deleterious species, such as  $\text{Na}_2\text{SO}_4$ ; however, methods for significantly slowing the diffusion of oxygen were not identified. 11 refs.

Prater, J.T. (Pacific Northwest Lab, Richland, WA, USA); Courtright, E.L. *Surf Coat Technol* v 32 Dec 1987, Pap Presented at the 14th Int Conf on Metall Coat - Part 1, San Diego, CA, USA, Mar 23-27 1987 p 389-397.

**086559 FRACTURE TOUGHNESS OF PLASMA-SPRAYED ZIRCONIA COATINGS.** Plasma-sprayed ceramic coatings are formed by introducing a powder into a plasma jet to produce a stream of molten particles which then impact, spread and rapidly solidify onto a substrate to form a lamellar microstructure. The cohesive and adhesive fracture toughness of zirconia coatings, fully or partially stabilized with  $\text{Y}_2\text{O}_3$  or  $\text{CeO}_2$ , plasma sprayed onto steel, have been determined using the double cantilever beam (DCB) technique. The results show that cohesive fracture toughness is greater than adhesive toughness and that tetragonal coatings have significantly higher toughness than fully stabilized (cubic) zirconia coatings. The highest toughness was achieved with  $\text{ZrO}_2\text{-CeO}_2$  coatings which contained a significant proportion of transformable tetragonal phase. The results are interpreted in terms of the influence of grain size and composition on the tetragonal-to-monoclinic phase transformation. (Author abstract) 9 refs.

**086560 RESIDUAL STRESSES IN  $\text{ZrO}_2\text{-}8\% \text{Y}_2\text{O}_3$  PLASMA-SPRAYED THERMAL BARRIER COATINGS.** The successful application of zirconia as thermal barrier coatings in the combustion chamber of diesel engines is dependent on their achieving adequate thermal shock resistance and resistance to attack by combustion gases. Of particular importance is the control of residual stresses in the ceramic coatings if useful lifetimes are to be achieved. An experimental technique for the determination of residual stresses is described, and the effect of varying spraying parameters such as deposition rate and air cooling, and the presence of a bondcoat, are discussed. (Author abstract) 11 refs.

**086561 NiCrAl BENTONITE THERMAL SPRAY POWDER FOR HIGH TEMPERATURE ABRADABLE SEALS.** The function and basic requirements of turbine engine clearance control abrasible seals are reviewed. For the specific case of an abrasible seal operating in the temperature range 650 - 850°C the use of a thermal-sprayed deposit of an alloy composite powder consisting of a bentonite core particle coated with an alloy layer of NiCrAl is described. A series of tests was carried out to arrive at an optimum combination of abrasibility, erosion resistance and oxidation resistance in the thermal-sprayed deposit. The selected composite powder consists of a closely sized bentonite core in the range 75 - 150  $\mu\text{m}$ , coated with an alloy consisting of Ni-5% Cr-3% Al, such that the alloy coating-to-core ratio is 80:20 by weight. When flame sprayed by standard practice this powder was found to produce an abrasible seal with the optimum combination of desired properties. (Author abstract) 9 refs.

## Combustion

**086562 PROTECTION OF ALUMINUM OVERCAST CONSTRUCTIONS AGAINST FIRE.** A test program was undertaken by the U.S. Mine Safety and Health Administration to evaluate various materials for protecting aluminum overcast constructions against fire. Selected coatings and one covering were tested under large-scale, simulated mine fire conditions to determine their effectiveness as a fire barrier for protection of aluminum. Coatings consisting of expanded vermiculite, limestone, and portland cement; mineral wool fibers in hydraulic setting, inorganic binders; cellulose mixed with liquid sodium silicate; and a fiberglass-reinforced surface-bonding mortar were particularly effective in protecting the aluminum structures against the heat of the simulated mine fire. Three inches of a ceramic-fiber blanket and a four-inch coating of phenolic spray foam also proved to be relatively effective barriers for fire protection under the conditions of the test. (Author abstract) 3 refs.

**086563 CORROSION PROCESS OF Zn-Co, Zn-Fe AND Zn-Ni ALLOY ELECTROPLATINGS.** The corrosion behavior of Zn-Co, Zn-Fe and Zn-Ni alloys containing about 10% alloying elements in pH 6 solutions was

investigated. At the beginning of immersion, corrosion rate of the alloy plating was larger than that of pure Zn plating because the alloying elements (Co, Fe and Ni) promoted a cathodic reaction. As corrosion proceeded, corrosion potential shifted to noble potential in a complex manner. The development of corrosion induces a corrosion groove reaching the underlying steel and an increase of relative content of the alloying elements in the corrosion products and/or on the alloy plating layers. The galvanic protection of the plating decreases, leading to corrosion of the underlying steel. When the solution contains NaCl, a compound  $ZnCl_2 \cdot 4Zn(OH)_2$  is formed as a corrosion product. (Edited author abstract) In Japanese. 14 refs.

**086564 SODIUM VANADATE INDUCED CORROSION OF MCrAlY COATINGS - BURNER RIG STUDIES.** The corrosion of several MCrAlY-coatings (M=Ni, Fe and Ni+Co) has been studied in a high velocity burner rig at 650, 800 and 950°C. The fuel used was diesel oil with additions of 3% sulfur, 200 ppm vanadium and 100 ppm sodium. The deposits formed on the specimens mainly consisted of sodium vanadates which were molten at the test temperature. Sodium sulfate was only found at and below 650°C. The corrosion mechanism involved was vanadate-induced hot corrosion. This corrosion mechanism is characterized by the formation of an oxide layer adjacent to the metal, the dissolution of oxide in the outer surface of the deposit. The continuous deposition of fresh vanadate on the surface served to maintain high corrosion rates of extended exposures. (Author abstract) 24 refs.

**086565 DETERMINATION OF CORROSION PRODUCTS OF THE COATING OF THE TIN-BISMUTH ALLOY BY THE MOESSBAUER SPECTROSCOPY METHOD.** It is known that the Moessbauer parameters (isomeric displacement, quadrupolar splitting) of the tin-bismuth alloy and tin oxide greatly differ. Consequently, the process of oxidation of the tin-bismuth alloy coating may be examined using Moessbauer spectroscopy. This work shows that this method can be used to determine the composition and growth of corrosion products. The investigations were carried out on specimens of brass electroplated with a tin-bismuth alloy. The bismuth content was 2%. 5 refs.

**086566 FIVE-YEAR OUTDOOR EXPOSURE CORROSION COMPARISON.** In this study, the outdoor corrosion resistance of both electroplated and mechanically plated zinc and cadmium coatings was observed at four outdoor exposure sites over a period of five years to determine relative corrosion resistance in terms of different deposit thicknesses. In addition, mixed mechanically deposited coatings of tin/cadmium, tin/zinc and cadmium/zinc were studied to compare their relative corrosion resistance. In all, seven different coatings of various thicknesses in the asplated, clear chromated and yellow chromated conditions were evaluated. The pure zinc coatings outperformed cadmium coatings of equal thicknesses in all environments, except the marine environment. The pure cadmium coatings outperformed the zinc coatings in the marine environment.

**086567 ATMOSPHERIC TESTING OF METALLIC COATINGS.** Metallic coatings have been used for centuries either for decoration or corrosion protection. Zinc coatings on steel have been used for their atmospheric corrosion resistance since the mid-18th century, and users and producers have accurately defined the

corrosion characteristics of the material in a wide variety of environments. Environmental and alloying effects are discussed. The performance of newer metallic coatings are covered in relation to their relative comparative behavior with respect to galvanized steel. Long term testing has been carried out over the last 45 years during which a significant change in atmospheric conditions has occurred worldwide due to pollution effects. The effect of this change on the corrosion of metallic coatings will be illustrated by empirical data obtained by annual exposures of standard materials. (Author abstract)

## Corrosion Protection

**086568 CHARACTERIZATION OF CORROSION INHIBITORS FOR ZINC COATINGS.** Chromate conversion coatings are widely used in the automobile and other industries to enhance environmental corrosion resistance of the zinc layers on zinc plated steel. A technique utilizing photo-excitation of charge carriers as a measure of the effectiveness of chromate conversion coatings as corrosion inhibitors has been developed. The technique involves irradiating the zinc oxide surface with pulsed UV radiation and observing the photo-response as a function of applied voltage using lock-in signal detection and amplification. Initial analysis of the data shows a linear relationship between the photo-response of the ZnO layer and applied bias voltage across the sample up to 3.2 V. (Edited author abstract) 5 refs.

**086569 STUDY OF CRACK INITIATION AND PROPAGATION IN Ni-Cr THERMALLY SPRAYED COATINGS USING ACOUSTIC EMISSION TECHNIQUES.** Many metallurgical coatings applied by thermal spraying tend to exfoliate or spall through the growth of cracks, presumably initiated at the metal-coating interface or at the substrate. The present study was undertaken to determine whether such cracks are at the substrate-coating interface or within the coating or the substrate themselves. An AISI 1045 steel overlaid with a nickel-chrome alloy was used and the samples were subjected to a positive stress and fatigued using sinusoidal oscillations. In order to obtain a continuous record of crack initiation and propagation, acoustic emission equipment was used. It was found that the cracks initiated in the coating near the interface and not at the substrate or interface as suggested elsewhere. The conditions promoting crack initiation were also determined. **086571 MODELLING OF DRYING OF COATINGS: EFFECT OF THE THICKNESS, TEMPERATURE AND CONCENTRATION OF SOLVENT.** Various factors are relevant in the drying of coatings in motionless air, e.g. the temperature at which the process is performed, the thickness of the coating and the concentration of solvent in the coating when the latter is deposited. A model, based on a numerical method with finite differences, has been constructed in order to describe the drying process under various conditions. The kinetics of drying have been shown as being controlled by the diffusion of the solvent through the paint and by the evaporation of the solvent from the coating surface. The diffusivity was concentration-dependent, the rate of evaporation and diffusivity varying with the temperature and following a relationship similar to the Clausius-Clapeyron law. **Evaluation** See Also COATINGS—Water Borne; IRON CHROMIUM NICKEL ALLOYS—Electrodeposition.

**086579 EVALUATION OF RUST-TOLERANT COATINGS FOR SEVERE ENVIRONMENTS.** There are more than 100 commercially available coatings that are made specifically to perform on rusty and contaminated steel. Fourteen of these were selected for a laboratory and field evaluation program. Twelve of the coatings were selected based on historical data, purported corrosion prevention mechanisms, and suitability for contaminated rust. In addition, two control coatings, a red lead alkyd and a tar mastic, were included. After two years in the field, all four rust-tolerant coatings and the red lead alkyd control had failed, while the tar mastic control exhibited incipient rusting portending the beginning of failure. The present evidence suggests that on inadequately prepared steel in severe environments, a low-cost, easily applied conventional system for which there should be modest expectations is the best strategy. 21 refs.

**Failure** See Also AIRCRAFT ENGINES, JET AND TURBINE—Protective Coatings; COATINGS—Degradation; STEEL—Protective Coatings.

**086580 EXAMINATION OF COATING FAILURE ON WING PIVOT FITTINGS OF F111 AIRCRAFT.** Examination of fuel and moisture resistance of a range of possible coatings has been undertaken against those currently in use on the wing pivot fittings in integral wing fuel tanks of F111 aircraft. The results suggest that coatings based on epoxy polyamide resins are sensitive to glycol ether compounds employed as fuel system icing inhibitors in aviation turbine fuels. A more resistant epoxy polyurethane paint coating has therefore been proposed for use on the inspection area of the fittings. It is also recommended that respraying over existing coatings inside the wing fuel tanks and of the fittings away from the inspection areas, a practice that has led to a series of intercoat adhesion failures following overhaul, be discontinued. ## Forming

**086584 INFLUENCE OF THE OPERATING CONDITIONS OF A BARREL ELECTROLYZER ON THE UNIFORMITY OF ELECTROLYTIC ZINC COATINGS.** The purpose of the work was to study the distribution of coating thicknesses on the components during zinc plating in a barrel in ammonia-urotropin (AUE) and zincate electrolyte with addition of NBTs additive. Experimental data indicate that the values of K (coefficient characterizing electrolyte composition) depend strongly on the load factor of the barrel, and are appreciably sensitive to variations of current density at low and high load factors. The optimal load factor with respect to the resistance of the influence of current density is about 40%. At this load the average value of K is 0.63 min<sup>0.5</sup> in AUE, and 0.68 min<sup>0.5</sup> in ZE. A certain decrease of the variance of the thickness of the zinc layers on simultaneously coated components with increase of current density can probably be attributed to increasing depth of penetration of current into the load. 7 refs.

## Health Hazards

**086587 RESPIRATORY PROTECTION IN THE PROTECTIVE COATINGS INDUSTRY.** Recently, the issue of worker respiratory protection in the protective coatings industry has received increased attention from both outside observers and members of the industry. Particular attention has been focused on the appropriateness of using silica sand in blasting, given its known link to the development of silicosis and other delayed lung disorders. Attention has also been given to the harmful effects that arise when abrasive blasters remove lead-based paints from bridges and breathe the respirable-sized lead dust created in the blasting process. This article focuses on ways to provide workers with respiratory protection from some of the hazards of the protective coatings industry. The regulations affecting an employer's responsibility for providing respiratory protection to workers who require it are reviewed as well as the sources of exposure and contamination. 9 refs.

Miller, Richard C. (ED Bullard Co). *J Prot Coat Linings* v 5 n 4 Apr 1988 p 36-41.

**086588 PROVIDING SAFE PRESPIRATORY PROTECTION IN THE PROTECTIVE COATINGS INDUSTRY.** Complying with OSHA standards and providing a safe respiratory protection program in the abrasive blasting and protective coating industries require investigation of the advantages and limitations of available respirator equipment in relation to site conditions. The principal objective is worker protection in the midst of a wide range of respiratory hazards. The article discusses the types of equipment and considerations such as compressed air contamination by carbon monoxide, water, oil and particulates, and breathing air purification. 12 Refs.

**Heat Resisting** See Also COBALT CHROMIUM ALUMINUM ALLOYS—Oxidation; GAS TURBINES—Corrosion Protection; GLASS—Coatings; METALLIZING—Plasma Spraying; METALS AND ALLOYS—Protective Coatings; SUPERALLOYS—Protective Coatings.

**086589 COMPARATIVE EVALUATION OF HIGH TEMPERATURE COATINGS FOR CORROSION PROTECTION OF FUEL INJECTOR TIPS.** Fuel injector tips fabricated from Hastelloy X and Haynes 188 alloys were coated with the electron beam-physical vapor deposition (EB-PVD) MCrAlY overlay coating ATD 63 (Temescal), the platinum aluminide diffusion coatings RT-22A (Chromalloy Research and Technology) and PS 138 (Turbine Metals Technology), an EB-PVD NiCoCrAlY-YSZ overlay coating (Chromalloy Research and Technology) and SN-5A, a vitreous phase ceramic coating (Solar Turbines Incorporated). The coatings were subjected to cyclic oxidation testing at 1149°C and cyclic corrosion testing with 95%Na<sub>2</sub>SO<sub>4</sub>-5%NaCl deposits at 982°C. Microstructural examination showed a correlation between oxidation protection and high platinum and aluminum levels for the platinum aluminide diffusion coatings. The NiCoCrAlY-YSZ overlay coating demonstrated poor adherence and spallation in oxidation testing. Debonding of this coating occurred through cracking of the oxidized surface (Al<sub>2</sub>O<sub>3</sub>) of the bond coat. SN-5A exhibited morphological changes in the coating matrix following oxidation-corrosion testing. (Edited author abstract) 11 refs.

**086590 ON DELETERIOUS EFFECTS OF OXIDE PARTICLES PROXIMATE TO FREE SURFACES.** Diffusion of oxygen through columnar grain boundaries formed during processing of coatings can lead to internal oxidation and the formation of oxide inclusions in close proximity to a free surface. Since oxidation is accompanied by an increase in volume, large misfit strains are generated at the inclusions. These stresses have been determined exactly for a cylindrical inclusion using linear elasticity theory and stresses for a spherical inclusion have been estimated using these exact solutions. These stresses seem to be significant in that they could lead to fracture or prismatic dislocation punching in a coating. In addition, it is shown that these hydrostatic stresses can accelerate kinetics of diffusion of the damaging species and lead to rapid deterioration of the coating. Furthermore, the stresses can induce the formation of pits at the coating surface which can grow into cracks and lead to failure of the coating. (Author abstract) 8 refs.

**086591 THERMAL BARRIER COATING LIFE PREDICTION MODEL.** The objectives of this research were to determine the predominant modes of degradation of a plasma-sprayed thermal barrier coating (TBC) system and then to develop and verify life prediction models accounting for these degradation modes. The TBC system consists of a low pressure plasma-sprayed bond coat layer of Ni-22Cr-10Al-0.3Y and an air plasma-sprayed yttria partially stabilized zirconia (ZrO<sub>2</sub>-8Y<sub>2</sub>O<sub>3</sub>) top coat on a conventionally cast Rene'80 (nickel-base) substrate. Thermal cycle testing of TBCs was employed to evaluate the effect of coating edges, bond coat oxidation, bond coat creep, top coat thickness and bond coat thickness. A time-dependent, non-linear finite element model was developed to predict the stresses-strains present in the TBC system. The model predicts failure in the TBC owing to imposed strains on the basis of the foregoing considerations; hence, changes in substrate and bond coat material, in geometry, in thickness and the effect of oxidation can be accommodated by this model. ## Heat Treatment

**086592 CHANGE IN CERTAIN PROPERTIES OF ELECTROLYTIC DEPOSITS OF ZINC AND LEAD DURING ANNEALING.** Natural aging or heat treatment of galvanic coatings leads to ordering of the crystalline structure of the deposits and an improvement in service properties. The authors investigated the changes in structure and properties (internal stresses, corrosion resistance, electrical resistance) of zinc and lead galvanic coatings in natural aging and low-temperature annealing. The electroplating of the zinc was done from a sulfate solution; that of the lead from a nitrate electrolyte. Natural aging of the deposits for a day did not lead to a significant change in lattice parameters. The corrosion resistance and electrical resistance of the deposits and the internal compressive stresses also remain unchanged. After low temperature annealing the corrosion rate of the zinc deposits decreases by 8.5% and that of the lead by 5.3%. There is a drop in electrical resistance (by 10-14%) and lattice parameters with a simultaneous relief in internal stresses. 7 refs.

**086594 EFFECT OF NITROGEN ION IMPLANTATION ON THE PROPERTIES OF COATINGS.** Ion implantation modifies the surface composition and properties of material by bombardment with high energy ions. The low temperature of the technique ensures the avoidance of distortion or surface degradation of components. Wear resistance can be improved by up to four times and the surface hardness of hard chromium and cobalt/tungsten alloys can be increased by up to 40% when an optimum dose of nitrogen is implanted. These effects are explained in terms of the formation of nitrides which improve the load bearing capacity of the surface and its abrasion resistance. (Edited author abstract) 22 refs.

**Laser Applications** See Also COATINGS—Sprayed.

**086595 CERAMIC COATING OF TITANIUM BY PULSED YAG LASER.** With the object of improving erosion and wear resistance of titanium (Ti), the feasibility of the formation of hard ceramics such as carbides, borides and nitrides on its surface was investigated by irradiating powder-predeposited Ti sheet with a pulsed YAG laser under argon (Ar) or nitrogen (N<sub>2</sub>) atmosphere. As a

result, a flat surface of laser-melted zone was formed depending on a proper amount of powders under appropriate laser irradiation conditions, and the fusion zone generally exhibited a dendritic microstructure. The analyses of X-ray diffractometer results confirmed that carbides, borides and nitrides were formed in addition to alpha-Ti phase in the vicinity of the surface, and probably constituted the dendrites in the fusion zone. Vickers surface hardnesses of fusion zones measured under 100 g load were increased and varied in the range of about 500 to 1200 kg/mm<sup>2</sup> in Ar atmosphere and about 1000 to 1700 kg/mm<sup>2</sup> in N<sub>2</sub> environment. **086597 ZINC COATING WITH THE AID OF AN EXTERNAL ELECTRODE AT HIGH CURRENT DENSITIES.** In this investigation the authors determined the optimal parameters of zinc deposition on carbon steels with the aid of an external electrode. It is shown that deposition of zinc is accompanied by increase of the acidity of the electrolyte. The current efficiency rises with increase of the electrolyte pH, reaching 99% at pH = 4. It follows from these data that the electrolyte pH should be kept in the range 3-4. The energy consumption is influenced by the thickness of the layer of absorbent material and by the temperature of the electrolyte. 5 refs.

**086598 COMPARISON OF PHOTOSTABILIZATION IN ACRYLIC/URETHANE AND ACRYLIC/MELAMINE COATINGS CONTAINING HINDERED AMINES AND ULTRAVIOLET ABSORBERS.** The photostabilization chemistry of a two-package acrylic/urethane coating containing a benzotriazole UV absorber and/or a hindered amine light stabilizer has been studied by using FTIR and ESR. FTIR has been used to follow the rate of chemical change on exposure of the coatings to UV light and humidity. The coatings are found to undergo photooxidation and loss of urethane cross-links during exposure. In contrast to melamine cross-linked coatings, humidity plays only a minor role in the degradation of the urethane coating. The addition of a benzotriazole UV absorber reduces the rate of degradation by reducing the rate of formation of free radicals. The addition of hindered amine greatly reduces the rate of oxidation and urethane loss. (Edited author abstract) 13 refs.

**086599 CORROSION EVALUATION OF VERY RAPID HIGH-CURRENT VACUUM ARC COATINGS.** The corrosion resistance of Al alloy, Ni, and stainless steel coatings deposited on 1010 steel sample anodes using pulsed high-current vacuum arcs was investigated as a function of the arc parameters. Coating thicknesses of up to 30 µm were obtained from a sequence of six 70-ms pulses, indicating effective coating rates of up to 72 µm/s. The thicker coatings and the best corrosion protection were obtained at higher currents (600-900 A) and short gaps (3 mm). The coatings were generally well bonded to the substrate. The composition of the coatings was approximately that of the source electrode. With optimal arc parameters, all three coating materials gave full corrosion protection during a 5-h salt-spray test, and Al and Ni coatings showed no signs of corrosion after a 48-h test. 5 refs.

**086602 RELATIONS BETWEEN COATING CONDITIONS AND PROPERTIES OF TiC LAYERS FORMED BY THE METHOD OF ION-PLATING.** Relation between the coating conditions and properties of the TiC layer formed on SUS304 stainless steels by activated reactive evaporation (ARE) was studied at electron beam (EB) emission currents ranging from 0.15 to 0.25 A, and acetylene gas pressures ranging from  $5 \times 10^{-4}$  to  $1 \times 10^{-3}$  Torr. Other parameters were fixed: ionization current = 1 A, substrate bias = -2 kV, and substrate temperature = 400°C. Measurement of composition by EPMA, lattice constant by X ray diffraction and micro-vickers hardness of the TiC layer showed that the lowest possible EB emission current and highest possible acetylene pressure were preferable. The conditions for obtaining the best TiC coating layer were found to lie within a limited range. In this experiment, the optimum conditions were found to be 0.17 A for the EB emission current and  $8.5 \times 10^{-4}$  Torr for the acetylene pressure. (Edited author abstract) 7 refs.

## Microanalysis

**086604 THIN FILM CHARACTERIZATION USING A MECHANICAL PROPERTIES MICRO-PROBE.** A new ultra-low load microindentation system has been acquired in the Metals and Ceramics Division of Oak Ridge National Laboratory. The system's spatial resolution and its data acquisition capabilities allow the determination of several mechanical properties from volumes of material with submicron dimension - hence the term mechanical properties microprobe (MPM). Research with the MPM at Oak Ridge has led to improved techniques for determining the plastic and elastic properties of materials using microindentation experiments. The techniques have been applied to thin films created by ion implanting metals and ceramics, radiation damaged materials and thin hard coatings of TiN. Changes in the strength (hardness) and modulus have been measured in films as thin as 200 nm. (Author abstract) 29 refs.

**086606 CROSS-SECTIONAL TRANSMISSION ELECTRON MICROSCOPY CHARACTERIZATION OF THE INTERFACE BETWEEN PLASMA-SPRAYED TiC AND INCONEL.** Transmission electron microscopy was used to study the very first layer of TiC deposited by plasma spraying over Inconel. Various techniques to prepare cross-sectional specimens have been reviewed and adapted to suit plasma-sprayed material. The main aspects considered were the relatively large thickness of the coatings, the irregularity of the interface and the different sputtering yields of the two materials. The results show that the TiC at the interface can have either a very fine unidirectional solidification or a coarser structure. These observations are discussed in terms of thermal contact with the substrate. We have not observed a structural link between the TiC and the substrate; the structure and the composition change

abruptly at the interface. Hence it is believed plasma-sprayed coatings is mainly mechanical. (Author abstract) 10 refs.

#### Microstructure

**086607 MICROSTRUCTURAL ASPECTS OF WEAR-RESISTANT STELLITE AND COLMONOY COATINGS BY LASER PROCESSING.** Two coatings were produced, using a high power CO<sub>2</sub> laser of 15 kw maximum power as a heat source to melt and bind Stellite and Colmonoy powders on to a substrate of AISI 304 stainless steel. The processing parameters were optimized in order to obtain homogeneous and uniform surface layers up to 1.5 mm thick. Morphological and microanalytical analyses were performed using Auger electron spectroscopy-scanning Auger microprobe and scanning electron microscopy techniques both on the coating and into the bonding region. The coating showed a homogeneous dendritic structure with some differences in grain size and shape. The intermediate precipitates were analyzed both in the coating and after extraction, by checking the chemical composition, structure and morphology. (Edited author abstract) 6 refs.

**086609 SURFACE CHARACTERIZATION OF IRON AND STEEL PRIOR TO COATING.** This report presents the latest knowledge on surface properties by which the mechanism and intensity of the adhesion of organic coatings can be influenced on iron materials. On the basis of experimental results it is concluded that greater attention should be paid to the hydroxyl group-containing primary oxides being formed spontaneously on steel surfaces following the mechanical or chemical pretreatment during contact with air, when coating materials and techniques are selected. If such a continuous, homogeneous primary oxide layer exists, its amphoteric surface hydroxyl groups can be utilized for the chemical adhesion of suitable organic film-formers. On steels whose surface is heterogeneous due to the island-shaped distribution of primary oxides, non-metallic deposits and pollutants, homogenization can be achieved by producing a conversion layer. Usually, phosphate and oxide layers have amphoteric surface hydroxyl groups, too, whose isoelectric point (IEPS) varies with the composition, so that it is possible to select thermodynamically favorable conditions for the chemical adhesion of organic coatings. (Edited author abstract) 134 refs.

**086610 DOW SHRINKS THE VOC IN ITS 1,1,1-TRICHLOROETHANE.** The Dow Chemical Co. has introduced a 1,1,1-trichloroethane for California coatings use that contains only 0.75% volatile organic compound (VOC) inhibitors by weight. In states where 1,1,1-trichloroethane is exempt as a coatings solvent, VOC additives in the solvent must be factored into compliance formulas. The new product, Proact, is expected to help industrial finishers in California's South Coast Air Quality Management District (SCAQMD) meet super-tough VOC compliance regs. The new product is particularly important to paint formulations that require only a marginal reduction in VOC to achieve compliance. Some resin systems require less thinning than others; some achieve application viscosities at well below the VOC limit. However, for those coating systems that are near or over the limit after thinning or formulating the final coating, Proact can play an important role.

**086611 ADHESION AND INHIBITOR PROPERTIES OF ORGANIC COATINGS INVESTIGATED WITH VERY THIN POLYMER FILMS ON NOBLE METAL ELECTRODES.** The electrochemical impedance and the rate of faradaic reactions were measured on platinum electrodes coated with very thin ( $\approx 10^{-3}$  cm) acrylonitrile glow-discharge polymer films. The desorption of the organic matrix from the metal surface after immersion into aqueous 1 M H<sub>2</sub>SO<sub>4</sub> was determined quantitatively. The rate of electrocatalytic charge transfer reactions is directly proportional to the number of unblocked metal surface atoms as determined from the hydrogen adsorption capacitance. The relevance of such measurements for protective coatings is pointed out. (Edited author abstract) 21 refs.

Dobhofer, Karl (Max-Planck-Gesellschaft, Berlin, West Ger); Eisel, Irmgard. *Corros Sci* v 27 n 9 1987 p 947-956.

**086612 CORROSION PROTECTIVE PROPERTY OF FERRITE PAINT FILMS.** The corrosion protective property and the effective pigment concentration of the paint of various mixture ratios prepared from ferrite pigments (MO-Fe<sub>2</sub>O<sub>3</sub>, M=Mg, Ca, Sr, Ba, Fe, Zn) and linseed oil were investigated by the various electrochemical measurements. From these results, the value of tan  $\delta$  of Mg ferrite paint of 4:1 (a mixture ratio of linseed oil and ferrite pigment), and of Fe ferrite paints of 4:2 and 4:3 was about 0.5. Both the resistance of their paint film (R<sub>p</sub>) and the charge transfer resistance (R<sub>ct</sub>) were larger than 10<sup>5</sup>  $\Omega$ . Consequently, it was found that the good corrosion protective property of Mg ferrite paint is seen in low pigment concentration and of Fe ferrite paint is seen in high pigment concentration. From the impedance measurement of SS 41 steel in the extracted aqueous solution of the paints, the value of R<sub>ct</sub> became large with time. Therefore, it was supposed that the corrosion protective property of the extracted aqueous solution is ascribed to the passivation of the decomposition components of linseed oil and ferrite pigments. (Edited author abstract) In Japanese. 11 refs.

Sekine, Isao (Science Univ of Tokyo, Noda, Jpn); Kato, Takeshi; Suda, Hideaki. *Boshoku Gijutsu* v 36 n 8 1987 p 487-491.

**086613 POSITRON IMPLANTATION AND ANNIHILATION IN PROTECTIVE ORGANIC COATINGS.** Positron implantation and annihilation were studied in two polymeric coatings, one pigmented and the other unpigmented, deposited on steel substrates. Positron lifetime spectra recorded on the coatings exhibited three components and closely resembled characteristic lifetime spectra of bulk polymers, but they were strongly dependent on the coating thickness. It was shown that the lifetime spectra could well be described as a sum of two contributions: spectra of the coating and the steel substrate. Differences between the measured and simulated lifetimes and intensities at low thickness values were associated with an inhomogeneous size and depth distribution of open volumes in the coatings. **086614 CONTAMINATION AND DECONTAMINATION EXPERIENCE WITH PROTECTIVE COATINGS AT TMI-2.** The extraordinarily high costs of protective coatings in nuclear power plants, coupled with concern about their effectiveness in facilitating decontamination, prompted questions about their use in this application. TMI-2, the only U.S. nuclear power plant subjected to the full spectrum of conditions resulting from a major reactor accident, provided valuable coating performance data. Coating systems are not likely to experience widespread physical degradation (peeling) or failure as the result of a severe core damage accident. Coatings and near-surface concrete will absorb fission products and be penetrated by water-soluble contaminants. Therefore, it is necessary to remove such coatings in order to effect decontamination. Given the high cost of coatings and related maintenance work, a program of coating improvement or replacement might offer substantial benefits. (Edited author abstract)

**086615 INFLUENCE OF UNDERSIDE MOISTURE ON FLOOR SCREEDS AND COATINGS: CAUSAL RESEARCH AND DAMAGE PREVENTATION.** Structural components made from concrete or floor screeds with coatings are frequently exposed on the underside to the action of precipitation, soil and ground moisture, seepage water or also groundwater. This action by water on the underside of the coating has in the last twenty years frequently resulted in damage to coated concrete components. The following influences have been discussed as possible causes of damage: vapour pressure; water pressure (hydrostatic pressure); saponification of the coating; swelling of the coating; condensation at the underside of the coating; osmosis; reaction and application temperature; action of solvents; differences in the coefficient of thermal expansion; high relative humidity at the time of application; low concrete temperature; reaction of the paint coatings with the air or the concrete; low concrete strength and concrete surface properties.

**086621 ASPECTS OF THE ADHESION AND CORROSION RESISTANCE OF POLYELECTROLYTE-CHEMISORBED ZINC PHOSPHATE CONVERSION COATINGS.** The ability of polyelectrolyte macromolecules to suppress the crystal growth of zinc phosphate (Zn · Ph) conversion coatings depends primarily on the functional pendant groups. The extent of segmental chemisorption of macromolecules having carboxylic and sulphonic acid groups on the embryonic crystal faces was found to be considerably higher than that of macromolecules containing amine groups. The reaction products formed by intermolecular reactions between amide groups in polyurethane coatings and carboxylic acid groups on the outermost surface of polyelectrolyte-modified Zn · Ph in Zn · Ph-to-polymer adhesive joint systems played an essential role in developing interfacial adhesive forces. A highly dense precipitation of Zn · Ph derived from a zinc orthophosphate dihydrate-based phosphating solution contributed significantly to reducing the corrosion rate of cold-rolled steel. It also was determined that the presence of an internally diffused polyelectrolyte in the Zn · Ph layers further enhances the resistance to corrosion of Zn · Ph itself. (Author abstract) 7 refs.

**086623 MANGANMODIFIZIERTE ZINKPHOSPHATUBERZUG ALS HAFTGRUND FÜR MODERNE LACKIERUNGEN.** [Manganese-Modified Zinc Phosphate Coatings as Primers for Modern Painting Processes]. The use of manganese ions in addition to zinc and nickel ions demonstrably improves corrosion protection in low-zinc phosphating processes, especially when employing surface-treated sheets. Incorporating manganese into the zinc-phosphate coatings results in smaller crystals of greater compactness and with higher alkali stability. Not only is the operating range of phosphating baths increased simultaneously, but aluminium can also be phosphated in combination with steel and galvanized steel to form a layer, with the generally attained quality standard guaranteed. (Edited author abstract). 13 Refs. In German.

**086624 EFFECTS OF CHROMIC-ACID CONCENTRATION ON THE STRUCTURE AND PROPERTIES OF CHROMIUM COATINGS.** The structure and physicochemical properties of the chromium coatings obtained from dilute chromic-acid electrolytes are rather poorly known. This work aims at closing this gap. The results obtained show that a decrease in chromic-acid concentration from 2.5 to 0.2 M influences the structure and properties of the chromium coatings in the same direction as increasing sulfate and silicofluoride concentration viz., the grain size in the deposits decreases, and the tendency of the deposits to undergo microcracking, their brightness, hardness, hydrogenation, and internal stresses increase. The data reported show that bichromate ions have no effects on the rate of chromium deposition and on chromium structure when they are present at constant relative concentration with respect to the sulfate ions. 7 refs.

**086625 MICROSTRUCTURE AND PHYSICAL PROPERTIES OF POLYCRYSTALLINE METASTABLE  $Ti_{0.5}Al_{0.5}N$  ALLOYS GROWN BY D.C. MAGNETRON SPUTTER DEPOSITION.** Metastable single-phase polycrystalline  $Ti_{0.5}Al_{0.5}N$  alloy films, approximately 3  $\mu$ m thick, have been grown on stainless steel substrates by d.c. magnetron sputter deposition from a TiAl target in mixed Ar- $N_2$  discharges. The deposition temperature was between 400 and 500°C and the applied negative substrate bias  $V_s$  was varied from 0 to 250 V. Electron microprobe analyses, using pure elemental standards, showed that the film composition was independent of  $V_s$  to within the experimental accuracy,  $\pm 3$  at.%. All films were found, based upon X-ray diffraction (XRD) and transmission electron microscopy (TEM), to have a B1 NaCl structure (AlN crystallizes in the wurtzite structure) with a (111) preferred orientation. The lattice parameter  $a_0$  of films grown at  $V_s < 80$  V was 0.4176 nm

and cross-sectional TEM showed that such films had a columnar structure exhibiting a high intercolumn, as well as intragrain, porosity. (Edited author abstract) 17 refs.

**086626 GERAETE UND EINRICHTUNGEN ZUR BESCHICHTUNG VON TECHNISCHEN OBERFLÄCHEN DURCH PLASMASPRITZEN.** [Equipment and Installations for Deposition of Coatings on Technical Surfaces by Plasma Spraying]. Plasma spraying has been established on an industrial scale in the early sixties. Since then the process has become remarkably more flexible and has gained significance in almost all industries. Recent developments in the processes, equipment and deposition materials are attributable to increasing demands on quality, new applications and the need for better operating characteristics and results. The authors present an overview of equipment and facilities for a process which has proved its merits and cost-effectiveness even in the present economic situation. (Author abstract) In German. 24 refs.

**086627 STAND UND ENTWICKLUNGSTENDENZEN BEIM PLASMASPRITZEN.** [State of and Development Trends in Plasma Spraying]. Equipment and process developments in plasma spraying have focused on improving torch performance and increasing gas flow rates, the design of manipulators and robots for special applications and part geometries, short and long-run production and multiple-powder systems for simultaneous and graded coating. Optimization and development of powder coatings aimed at fully exploiting the advantages offered by plasma deposition will gain increasing importance and open up further applications. A wide variety of materials amenable to the process is available. Both low-melting plastics as well as high-melting refractory metals can be deposited by plasma spraying. The use of the process has already extended far beyond the deposition of corrosion and wear-resistant coatings. Thermal coatings are not only being applied for repair work; they are also used in production to impart specific surface properties. Since the combination of substrate and coating can largely be selected at random, the process offers enormous potential for use. (Edited author abstract) In German. 11 refs.

**086628 EFFECT OF LASER TREATMENT ON THE STRUCTURE, COMPOSITION AND MICROHARDNESS OF PLASMA COATINGS OF THE Fe-Cr-V SYSTEM.** The effect of treatment by continuous  $CO_2$  laser according to different modes of the capacity introduced on the structure, composition and microhardness of plasma-sprayed coatings of the Fe-Cr-V system is investigated. Variations of the chemical and phase compositions of coatings, compared with the initial sprayed ones, as a result of their alloying with substrate elements, are established. Differences in the formation of the strengthening wear-resistant phases, depending on treatment conditions, are noted. Laser treatments of plasma-sprayed coatings makes it possible to increase considerably their adhesion and, when combined with

high-rate cooling, offers a possibility to control the processes of structure formation, dispersion and phase formation. (Translated author abstract) In Russian. 5 refs.

**086637 EFFECT OF MODULATION OF THE PLASMA ARC ON THE STRUCTURE OF COATINGS.** It is shown that the extent of dispersion of sprayed particles and the structure of coatings vary in relation to the parameters of modulation of the plasma arc. The effect of shock waves removes the oxide film from the surface of particles and caused partial degassing. Consequently, the amount of the nonmetallic oxide component in the coating decreases by a factor of 3-4. These processes reduce the gas permeability of the coatings by an order of magnitude. (Author abstract) 5 refs.

**086643 PHYSICO-CHEMICAL INTERACTION BETWEEN SPRAYED PARTICLES AND A POWDER BASE.** Within the framework of the theory of thermal activation of the process of formation of a strong bond between sprayed coatings, an analysis is made of the physico-chemical processes taking place in the contact between a particle and its powder base. Theoretical calculations of the kinetics of the development of a topochemical reaction at the interface are compared with original experimental data on the effect of the magnitude of the average porosity P of the sintered iron powder based on the strength of the bond with it of sprayed nickel particles. The conclusion is drawn that the effect of the porous structure of the zone adjacent to the surface of the

substrate on the generation and growth of seizure centers is decisive. The range of the P values within which maximum development of physico-chemical interaction is possible is established. (Translated author abstract) 8 refs. In Russian.

**086644 INDENTATION TOUGHNESS TESTING OF PLASMA SPRAYED COATINGS.** The sharp indentation technique for determining material toughness was applied to selected plasma sprayed coatings and for comparison, annealed glass. Three distinct types of crack pattern are observed in the ceramic coatings at all loads within the working range. Little correlation between indentation-derived fracture data and that from double cantilever beam methods could be found. This is attributed to the non-ideal behaviour of the porous stressed coatings during indentation loading. It appears that the relationship between indenter stress field and coating microstructure may provide information on coating toughness as indentation-derived  $G_c$  data was found to fit a Weibull distribution. This suggests characterizing coatings in terms of their Weibull modulus and characteristic strength, an approach which may prove useful in both toughness and quality control applications. Indentation tests were performed on plasma sprayed coatings of commercially pure  $Al_2O_3$ ,  $Al_2O_3$ -2.5wt percent  $TiO_2$ , and Ni-20wt percent Al. (Author abstract) 36 Refs.

**086645 FUNDAMENTAL IRRADIATION PROCESSES RELEVANT TO PLASMA-SURFACE TECHNOLOGY.** Plasma-surface technology is becoming increasingly widely used for both controlled growth and erosion of solids. The interactions between the plasma and a surface include irradiation of the latter with a range of projectiles including atoms, ions, electrons and photons. This review examines the important fundamental processes which occur during irradiation with these species separately and in synergism. (Author abstract) 48 Refs.

Carter, G. (Univ of Salford, Salford, Engl); Nobes, M.J.; Katardjiev, I.V. *Vacuum* v 38 n 6 1988 p 479-486.

**086646 LOW LOAD ABRASIVE WEAR BEHAVIOUR OF PLASMA SPRAY AND LASER-MELTED PLASMA COATINGS.** Low-load abrasive wear characteristics of plasma-spray and laser-melted plasma coatings have been determined using the block-on-cylinder test configuration. Marked differences observed between the wear behaviors of the plasma coating and the melted layer were attributed to the removal of the faults inherent in the plasma spray coating and significant changes in the composition due to the laser melting. The structure of the layer is prone to rapid wear by a delamination mechanism. Plasma coat melting by laser removes the flaws, generating an adherent wear-resistant layer exhibiting a wear behavior similar to that of hardened wrought steels. (Edited author abstract) 24 Refs.

Boas, M. (Technion-Israel Inst of Technology, Haifa, Isr); Bamberger, M. *Wear* v 126 n 2 Sep 1 1988 p 197-210.

**086647 PHASE TRANSFORMATION IN PLASMA-SPRAYED IRON OXIDE COATINGS.** Pure and silicon-, indium- and magnesium-doped  $\alpha-Fe_2O_3$  powders have been plasma sprayed on titanium substrates. The resulting coatings were analyzed by electron and optical microscopy, thermogravimetry and x-ray diffraction. The results show that  $Fe_3O_4$  is present in all coatings and comes from the reduction of  $Fe_2O_3$ . The latter phase is also obtained in most of the coatings and its presence is explained on the basis of a mechanism of re-oxidation of  $Fe_3O_4$ . This mechanism is affected by the spraying distance and also by the presence of dopants. These plasma-sprayed coatings have semiconductive properties which can find applications in photoelectrochemical or photocatalytic systems. (Author abstract) 18 refs.

Dallaire, S. *Thin Solid Films* v 154 n 1-2 Nov 12 1987, Pap Presented at the Int Conf on Metall Coat - Part II, San Diego, CA, USA, Mar 23-27 1987 p 57-64.

**086648 INTERRELATIONSHIP BETWEEN INTERNAL STRESS, PROCESSING PARAMETERS AND MICROSTRUCTURE OF PHYSICALLY VAPOUR DEPOSITED AND THERMALLY SPRAYED COATINGS.** For plasma-sprayed coatings in particular a heat transfer model is described which predicts the variation in residual stress distribution as a function of coating thickness and deposition rate and the results are compared with experimental observations. The level of residual stress in plasma-sprayed tungsten have been measured by x-ray and mechanical slitting methods and explanations as to why these methods yield different results given. For PVD tungsten coatings the most important systems parameter is substrate bias since this allows some stress relaxation to occur via its influence on porosity levels in the coating and the consequences this has on residual stress levels is discussed. In PVD tungsten coatings the internal stress was completely relaxed on dissolution of the substrate, accompanied by a decrease in the lattice parameter of the film. (Author abstract) 62 refs.

**086649 PLASMA DIAGNOSTIC STUDIES OF THE ACTIVATED REACTIVE EVAPORATION PROCESS.** Plasma volume reactions play an important role in the deposition of films by plasma-assisted processes. We have applied several techniques to the analysis of the plasma volume in the activated reactive evaporation process. Neutral mass spectrometry, plasma mass spectrometry and optical emission spectroscopy (OES) were used to examine the nature and relative concentrations of neutral, excited neutral and ionized species present in the process. Initial experiments involved evaporating titanium in the presence of  $CH_4$  and  $C_2H_2$  gases. Results of plasma mass spectrometry and OES indicate several differences between the species observed depending on the reactive gas used and the evaporation rate used. These results have been used to explain possible reaction paths for TiC compound formation as well as to correlate the dependence of film properties on the deposition conditions. (Author abstract) 15 refs.

**086652 ZIRCONIUM NITRIDE FILMS PREPARED BY CATHODIC ARC PLASMA DEPOSITION PROCESS.** Zirconium nitride has been reactively deposited using the cathodic arc plasma deposition process. Deposited films have been analyzed for their surface morphology, crystal structure, microhardness and composition. Performance of the films was evaluated by conventional wear testing methods and the potential for decorative applications by reflectivity measurements. Wear test results indicated that ZrN is marginally superior to titanium nitride in conventional metal cutting applications, but outperforms TiN by a factor of two when cutting titanium alloys. Reflectance measurements indicate that ZrN-doped films are very similar to gold films. (Author abstract) 11 refs.

**086653 PLASMA-SPRAYED TiC PROTECTIVE COATINGS FOR FUSION DEVICES: COATING FABRICATION CRITERIA.** Titanium carbide is of interest for limiters in tokamak-type fusion devices subjected to high pulsed heat loads because of its low physical and chemical sputtering yield under ion bombardment. This study was carried out to outline the fabrication criteria needed to obtain thick TiC coatings which can withstand severe thermal shocks. TiC coatings with different microstructures (porosities) and thicknesses, plasma-sprayed under atmospheric and inert atmosphere conditions, were exposed to pulsed electron beam thermal shocks. The results obtained after thermal exposure indicate that the thermal shock resistance decreases as the TiC coating porosity increases. They also indicate that coatings obtained by spraying a narrow band powder into an inert gas enclosure contain some porosity that could help them to withstand spallation. 12 refs.

**086654 OPTIMIZED VACUUM PLASMA-SPRAYED TITANIUM COATINGS.** With vacuum plasma-spraying, there is now a process which can produce dense adhesive coatings of the reactive titanium, and this may expand its range of application. The quality of vacuum plasma-sprayed (VPS) coatings is largely dependent on the proper optimization of spraying parameters. This paper shows that, by two-level factorial analysis, a drastic reduction of porosity is achieved, which is the primary requirement for corrosion protection. The mechanical properties of optimized plasma-sprayed coatings were investigated. Low gas contents in the layers and a proper pretreatment of the substrates including sputtering and preheating gave highly ductile and adhesive coatings. The dependence of both properties on either the powder grain size or its oxygen content was tested. The adhesion strength was determined for different substrate materials such as austenitic steel, carbon steel and titanium alloy, where an average value of  $75 \text{ N mm}^{-2}$  was measured. (Edited author abstract) 5 refs.

**086656 FUNDAMENTAL STUDIES ASSOCIATED WITH THE PLASMA SPRAY PROCESS.** More than 25 years ago, plasma spraying was established as a commercial process, but only recently have serious attempts been reported to establish a solid scientific base for this technology. The first part of this paper refers to the basic processes involved in plasma spraying, including plasma generation, plasma jet formation, particle injection, particle heat and momentum transfer, and particle deposition. In the second part, recent results obtained in this laboratory are summarized. These results are mainly concerned with the effects of vortex flow on particle motion and on air entrainment during atmospheric spraying. (Author abstract)

**086657 EFFECT OF CHAMBER PRESSURE ON PARTICLE VELOCITIES IN LOW PRESSURE PLASMA SPRAY DEPOSITION.** A laser velocimeter has been used to measure spray particle velocities in a low pressure plasma spray system at chamber pressures ranging from 6.7 to 80 kPa (50 to 600 Torr). For  $Al_2O_3$  spray powder with a mean diameter of 44  $\mu m$ , peak particle velocities were of the order of 200 - 400  $m s^{-1}$ . The measured velocity distributions were strongly dependent upon spray chamber pressure, with the highest particle velocities at intermediate pressures of about 40 kPa (300 Torr). Particle velocities predicted with a simple analytical model are in reasonable agreement with experimental results close to the spray gun, where drag due to chamber gases can be neglected. This simple model also correctly predicts a particle velocity maximum at 45 kPa (340 Torr). (Author abstract) 4 refs.

**086658 PERFORMANCE OF PIGMENTS IN BARRIER COATINGS.** This paper has attempted to demonstrate that the corrosion protection obtained through the use of high build, aluminum epoxy mastics is considerably greater than expected based on several known mechanisms of coatings performance. It has been demonstrated that reduction in oxygen permeation is not the limiting

factor. The data strongly suggest that the enhanced performance with aluminum pigmentation exceeds that which would be expected based merely on the barrier effect of high build epoxies plus the anticipated improvement due to reduction in moisture vapor transmission rates. The frequently observed, and readily reproduced, enhanced performance over hand-cleaned rusty steel substrates as opposed to clean steel has not been explained. 12 refs.

Montle, John F. (Carboline Co). *J Prot Coat Linings* v 4 n 6 Jun 1987 p 38-45.

**086659 CHEMISTRY OF FILM-FORMING RESINS.** Frequently, the generic name of a resin is not a useful clue to its structure and function. For example, a mixture of an epoxy resin and other materials may undergo a manufacturing process that produces a material having little resemblance to conventional epoxy resins, but this product may be marketed as an 'epoxy' because of the favorable connotations of that name. One of the goals of this article is to teach the reader that, for example, an 'epoxy' resin is not always an epoxy resin. Liquid coatings are converted to dry films by one of five distinct mechanisms. The properties of the film are determined primarily by the process by which it is formed. For each process, this article discusses the mechanism, gives generic examples of film-forming resins that are used as binders for corrosion control, and explains how the film-forming mechanism influences the properties of the dry film. The mechanisms are discussed in the order of their importance in modern coatings for controlling corrosion. 3 refs.

Brady, Robert F. Jr. (US Naval Research Lab, USA). *J Prot Coat Linings* v 4 n 7 Jul 1987 p 42-51.

**086660 CROSSLINK DENSITY OF HIGH SOLIDS MF-CURED COATINGS.** Dynamic mechanical analysis (DMA) and solvent induced swelling were used to determine the crosslink density (XLD) of cured films. Films were prepared from polyester or acrylic polyols crosslinked with etherified melamine formaldehyde (MF) resins. Cure conditions were found for which co-condensation of the polyol with the MF resin was complete and self-condensation of the MF resin was avoided. Under these conditions, excellent agreement was found between experimental XLD values and XLD values calculated from structure using rubber elasticity theory and swelling theory. New insights concerning network formation in high solids films became apparent. It was found that all of the methoxymethyl groups in MF resins can react during cure. (Edited author abstract) 30 refs.

**086661 EFFECT OF WATER CONTAMINATION ON THE PERFORMANCE OF URETHANE ACRYLATE COATINGS.** The protection of delicate components from damaging environmental effects is a primary advantage of radiation curable coatings. These liquid coatings can rapidly be transformed into highly cross-linked polymers, yet the process is inoffensive to heat sensitive substrates. The effects of contamination of the uncured coating are first examined. Viscosity, shelf life, tensile properties of the film, and glass transition temperatures of the cured polymer are discussed. Next, the effect of humidity and water on the tensile properties of the cured urethane acrylate are analyzed. Finally, methods for determining the presence of water contamination are discussed. 5 refs.

**086662 AIR-DRY PLASTIC - AN EVOLVING COATING MATERIAL.** Air-dry plastic is a blend of polyvinyl chloride (PVC), solvents and plasticizers. For many years, air-dry plastic has been used for repair of damaged areas on thermally-cured vinyl (plastisol) coatings at the tips of plating racks and for masking applications. Among its newer applications are repair of polypropylene tanks, nonslip flooring and impact protec-

tion. Air-dry plastisols are highly resistant to the acids and salts used in the metal finishing shop, withstanding continuous immersion in common electroplating solutions and most acid pickles. ?

**086669 METHODENKOMBINATION ZUR UNTERSUCHUNG DER KORROSIONSSCHUTZWIRKUNG VON ANSTRICHEN.** [Combination of Methods to Study the Corrosion Protection Properties of Coatings]. The authors describe a procedure consisting of a combination of impedance and resistance methods which enables the inhibitor and barrier effects of organic coatings to be determined separately. The procedure involves measuring corrosion losses by means of resistance measurement on steel foils. The barrier effect is characterized by the frequency-related conductivity,  $(\omega \cdot R_p)^{-1}$ , while the inhibitor effect is characterized by the start of corrosion and the slope of the function  $K=f(t)$ . The efficiency of the method is demonstrated by investigations on chlorinated rubber coatings. (Edited author abstract). 12 Refs. In German.

**086670 FLUOROPOLYMERS AS COATING MATERIAL.** The durability of fluoropolymers has been discussed with focus on FEVE (Fluoroethylene/Vinyl Ether Copolymer) and the coatings made from it. The limited use of a weather-proof coatings system which is due to the rather poor processability of thermoplastic fluoropolymers is almost completely solved by the use of the thermocurable fluoropolymers, FEVE, which are sufficiently soluble in organic solvents and curable over a wide temperature range. Furthermore, the scope of the application of fluoropolymers to coatings should expand into various fields not only because of the superior weather-ability, but also because of special features such as low friction, abrasion, oil and water repellency, non-adhesiveness and antifouling. These features are primarily caused by the unique nature of the C-F bond in the polymers. 14 Refs.

Urbana, Illinois, recently saw a problem developing in the number of bumpers rejected for finish defects, it called on the expertise of its suppliers to help find a solution. As many as half of the company's rear step and hitch truck bumpers were being rejected daily because gel particles were forming during powder coating application. Complete analysis of powder coating system led to improvements that have bettered quality and cut rejects.

Roberts, James. *Prod Finish (Cincinnati)* v 52 n 1 Oct 1987 p 80-84.

**086673 PC FOR PC.** Many companies are striving to be more cost effective in order to meet foreign competition. One way is to buy manufacturing equipment that operates by itself (as much as possible), doesn't make mistakes and, if programmed properly, will produce perfect parts consistently. Programmable controllers (PC) are not the answer to everything, but they can keep track of what occurs on the finishing line and assure that the finishing processes are performed as accurately as the previous manufacturing steps. Programmable controllers can decrease down time and rejects on a powder coating line.

Lehr, W.D. (Finishing Systems Consultants, Prior Lake, MN, USA). *Prod Finish (Cincinnati)* v 52 n 2 Nov 1987 p 82-85.

**086674 POWDER COATING - A VERSATILE FINISH FOR VEHICLE AND COMPONENT MANUFACTURERS.** Powder coating is one of the fastest growing sectors of the world coatings market. In the competitive business of vehicle manufacture, importance is placed on the performance of coatings and their ability to cope with harsh environmental conditions. This has led to the evolution of a range of powder coating chemistries which covers a variety of applications throughout the transportation industry.

Davis, Tim (Int Paint plc). *Corros Prev Control* v 34 n 5 Oct 1987 p 117-120.

**086675 SPECIALITY POWDER COATINGS GIVE AN UNMATCHED RANGE OF FINISHES.** The use of powder coatings has grown over the last fifteen years at the expense of traditional solvent based industrial finishes. One of the reasons for this growth has been the development of speciality powder finishes such as textures, structures, antiques and hammers. Speciality powders give finishes similar to those obtained with wet paints but are easier to apply. Novel finishes which are easy to use and have a unique appearance unobtainable with wet paints have also been developed. An example of these is the antique finish.

Howell, David (BASF Coating & Inks). *Prod Finish (London)* v 40 n 8 Aug 1987 p 11-12.

**086676 POWDER COATINGS FOR THE BUILDING SECTOR.** High ultimate film performance, application versatility and economics make powder finishing an ideal choice for architects, specifiers and construction and component suppliers to the building sector. Powder coatings are used, for example, to protect steel pipelines in both land and sub-sea oil and gas operations in conditions ranging from the heat of the Middle East to the cold of the Canadian arctic. It is under such hostile conditions that fusion bonded epoxy (FBE) powders best demonstrate their unique combination of excellent corrosion protection, toughness and flexibility.

Higgins, Richard J. (Int Paint plc, Gateshead, Engl). *Prod Finish (London)* v 40 n 8 Aug 1987 p 17-18, 20.

**086677 PROTECTING AND DECORATING METAL SURFACES BY FLUID BED POWDER COATING.** The article discusses the Rilsan Nylon 11 fluidised bed coating. It is simple in its approach, requires less costly plant than normal powder coating and is ideal for producing thick coatings (up to .025 in) on a variety of substrates of varying mass. Rilsan Nylon 11, known for its ease of processing by injection molding and extrusion, has proved of most interest as a protective and decorative coating on metals.

Hornsby, Peter (Atochem, UK). *Prod Finish (London)* v 40 n 8 Aug 1987 p 6-7, 12.

**086678 PRETREATMENT FOR POWDER COATING.** During the past ten years, pretreatment technology for steel and zinc prior to powder coating has progressed at a relatively modest pace compared with requirements for aluminium. Demand for powder coated aluminium components has risen for window frames, double glazing extrusions and similar architectural features. For steel, zinc coated steel and aluminium, the reason for pretreatment is to convert the metallic surface to a condition that will ensure the long-term adhesion of a cured powder film and promote its corrosion protection.

Lund, P.J. (Pyrene Chemical Services Ltd). *Prod Finish (London)* v 40 n 9 Sep 1987 p 16, 19.

**086679 GROWTH OF POWDER COATINGS TECHNOLOGY FOR FINISHING OF BUILDING COMPONENTS.** The type of powder chemistry used in the finishing of aluminum building extrusions varies around the world, but in Europe, architectural-grade TGIC/polyester powders are the most common. Architectural aluminum finishing is handled largely by specialist coaters who are equipped to carry out the required ten or eleven-stage chromate pretreatment of the aluminum profiles or cladding panels. The article describes the Interpon range of architectural polyester powders.

Higgins, Richard (Int Paint Powder Coatings). *Finishing* v 12 n 2 Feb 1988 p 36, 38.

**086680 CHARACTERISATION OF POWDERS FOR THERMAL SPRAYING.** The properties that fully characterise a powder for thermal spraying are listed. Control of one or all of these is necessary to maintain reliable reproducibility in the properties of thermally sprayed coatings. They include chemical composition, microstructure, particle morphology (shape, size, size distribution), type (related to method of manufacture) and physical properties.

Kilp, F. (VALCO Werkstoff-Technologie GmbH, Dueseldorf, West Ger). *Met Constr* v 20 n 4 Apr 1988 p 169-170.

**086681 DESIGNING A COMBINATION ELECTRODEPOSITION/POWDER COATING SYSTEM.** Both electrodeposition and powder coatings exhibit characteristics that are very nearly ideal for compliance with environmental protection standards. Given the increase in finish durability (especially salt spray resistance), minimal additional equipment requirements, high operating efficiency and low labor and maintenance costs, a combination electrocoat/powder coating system may prove a desirable solution to finishing problems, especially in shops serving the appliance and automotive industries. Following the design guidelines outlined will ensure successful installation and operation of such a system in most manufacturing and/or custom coating shops.

Marino, Frank P. (DPP Systems Inc, Norwalk, CT, USA). *Met Finish* v 86 n 5 May 1988 p 23-25.

**086682 PRETREATMENT FOR POWDER COATING.** The highest quality powder coating can provide excellent results if the pretreatment is done correctly and the overall system is maintained up to its potential. The article defines a clean surface as opposed to poor cleaning. There is a brief discussion of conversion coatings. Iron phosphate and zinc phosphate pretreatments are covered.

Gruss, Brad B. (Fremont Industries Inc, Shakopee, MN, USA). *Met Finish* v 86 n 5 May 1988 p 29-31.

**086683 COMPLIANCE COATINGS - AN OVERVIEW.** Emission regulations regarding VOC and energy conservation accelerated the creativity of the coatings industry and its scientists to develop and improve new technologies which would perform as well as or better than conventional solvent systems. Working with equipment manufacturers and users of coatings, several suppli-

## Plastics Applications

**086671 FEATURES OF THE ELECTROCHEMICAL STAGES OF FORMATION OF PROTECTIVE POLYMER COATINGS.** Polymer coatings applied to metal articles by electroprecipitation have elevated physical and mechanical properties and are superior to coatings prepared by traditional methods with respect to their protective properties. The high degree of organization of the supermolecular structure and uniformity of the polymer film, which is in turn due to and determined by the features of the electrochemical stages of the process, is one of the determining factors of the effect of the electroprecipitation parameters on the properties of coatings. The mechanism of the electrode reactions which take place in electrolysis of solutions of polymers was established in this study. Results indicate that the adhesion of the film to the metal increases and corrosion under the film is inhibited due to the surface activity of the pyridine ring. Addition of such modifying agents as dibutyl phthalate and butyl acrylate to the polymer system positively affects the elasticity and adhesion of the coatings to a copper base, which increases the time in service of the protected articles. The physical and mechanical properties of the electroprecipitated coatings are reported. 6 refs.

**086686 PULVERLACK: EINFLUSS VON BINDEMITELEN UND PIGMENTEN AUF DEN KORROSIONSSCHUTZ.** [Powder Coatings. Effect of Binders and Pigments on Corrosion Protection.]. Rather than focus on the general processes of corrosion, which are sufficiently familiar from coating chemistry, this article takes a look at the recipe composition of powdered corrosion protection systems. The latter differ greatly from 'wet' compositions, as special influences can be exerted when processing electrostatic powder coats. (Edited author abstract). In German.

Weigel, Kurt. *Metalloberflaeche* v 42 n 7 Jul 1988 p 333-339.

**086687 LOWER TEMPERATURE CURE POWDER COATINGS.** Current state of the art in lower temperature cure powder coatings technology offers products with functional performance characteristics and aesthetic properties consistent with standard cure materials. Most functional and aesthetic requirements can be met or exceeded with low temperature cure powders. A number of factors dictating the use of low temperature cure powders are cited, including energy conservation.

Sandor, Timothy L. (Pratt & Lambert, Buffalo, NY, USA); St. John, James J. *Met Finish* v 86 n 8 Aug 1988 p 38-39.

**086688 POWDER COATINGS AND THEIR USES.** Today, powder coatings can be utilized for almost any application where steel, galvanized steel or aluminum is the substrate. Present-day thermoset powder coatings technology is rivaling all but the most specialized industrial liquid applications. Thermoset powder coatings are classified into five basic chemical groups: epoxy, epoxy-polyester (commonly referred to as hybrid), polyester-urethane, TGIC-polyester, and acrylic. The specific uses for each chemistry are varied, and often 'cross-over' depending on customer specifications and performance criteria.

**086689 NEW FLAVEL LEISURE COMPONENT FINISHING PLANT EXCEEDS EXPECTATION.**

Major plant modifications involving refurbishment and re-equipment of the product finishing facilities were completed during the two weeks annual shut-down at Flavel-Leisure manufacturing in Royal Leamington Spa. This necessitated stripping out old pre-treatment and finishing equipment including ovens, booths and conveyors and the laying down of new production flow lines and the installation of the latest design of powder coating equipment. The Company's products include gas and electric stoves.

Anon. *Prod Finish (London)* v 41 n 8 Aug 1988 3p.

**086690 THIN FILM POWDER COATING.** The increasing worldwide demand for powder coatings is due mainly to the continuous development of products which meet more stringent environmental legislation, give greater chemical and corrosion resistance and yet show cost benefits when compared with other surface coatings. This paper deals with one aspect of product development - thin film powder coatings. The topics covered are formulation, manufacture, application and reclamation.

Ingleston, R. (Ferro Drynamels Ltd, Engl). *Prod Finish (London)* v 41 n 8 Aug 1988 p 15-16.

**086691 MANAGEMENT OF POWDER RECOVERY.** Powder coating is the fastest growing and is becoming the most technically advanced of paint finishing technologies. It is estimated that 93,000 tonnes of powder will be used in Europe in 1988 - a market of £230m, and this will increase £400m at today's prices by 1995. The largest percentage growth will take place in the UK where the tonnage will increase from 13,000 this year to 26,000 tonnes in 1995. A crucial factor in the operation of large powder coating plants is to recover oversprayed powder efficiently and reuse it. The article discusses transfer efficiency, correct jigging, computer control and cyclone separation.

Craine, Ken (Itep (UK) Ltd, Croydon, Engl). *Prod Finish (London)* v 41 n 8 Aug 1988 p 18-20, 30.

**086692 TECHNICAL NOTE: IMPROVED UNIVERSAL POWDER MASS FLOW CONTROL FOR THERMAL SPRAY APPLICATIONS.** In thermal spray, a major cause of inconsistent coating quality is the inability of the typical powder feeder to deliver powder at a constant rate. A higher degree of consistency has been achieved by monitoring powder mass flow while making adjustments via closed-loop analog control. Screw and meter-wheel powder feeders were used at powder mass flow rates from 2 to 10 lb h<sup>-1</sup> (15 to 76 g min<sup>-1</sup>). Experiments were conducted with powders having various particle size distributions, densities and morphologies. The results of the data obtained are reported using standard deviation calculations. **086698 EROSION OF HARD MATERIAL COATING SYSTEMS.** The use of coating systems to protect structural metal surfaces from elevated-temperature, small-solid-particle erosion and erosion-corrosion can extend component life and permit operation in more severe environments. The room and elevated-temperature erosion behavior of several hard material coating systems, i.e., carbides, borides and nitrides, were determined over

a range of test conditions. Particle velocities from 70 to 150 m s<sup>-1</sup> and test temperatures from 25 to 540°C were used. Mechanisms of erosion were established and related to erosion rates in a manner that defined the requirements of composition, morphology and defect levels of coating systems for long-term performance. It was determined that small grain size, low porosity and absence of cracks were the microstructural features that enhanced erosion resistance. Hardness levels and the composition and distribution of second-phase, hard particles had less effect on coating performance. (Edited author abstract) 7 refs.

**086700 MATCHING COATINGS WITH ENVIRONMENT.** Successful coating specifications are founded on a basic understanding of coatings technology. Three major categories of exposures - light, moderate, and severe - have been identified as predominant in plant environments, and a selected group of coatings have been found most suitable for these exposures. The coatings most frequently used in these environments include water-based acrylic, alkyd, silicone alkyd, chlorinated rubber, epoxy, coal tar epoxy, polyurethane, vinyl, and zinc rich. The article discusses characteristics of these coatings and factors to consider in applying them in the various environments.

Riders, Zig (Sherwin-Williams Co, Cleveland, OH, USA). *Plant Eng (Barrington Ill)* v 41 n 21 Nov 12 1987 p 92-94.

**086701 SELECTION AND USE OF PROTECTIVE COATINGS FOR WATER STORAGE AND WASTE TREATMENT FACILITIES.** A good protective coating job in a water or wastewater treatment plant requires the teamwork of several people: the engineer, the applicator, the coatings manufacturer, and the inspector. A good specification means better bidding, better job timing, and compatibility of shop coatings and field paints. Although water and wastewater plants are alike in many ways, they are quite different in their effect on a coating system. The wastewater plant is generally far more difficult to protect with a paint system. Generally speaking, any coating system that will give good service in a wastewater treatment plant will, in a similar exposure, give good service in a water treatment plant. But the reverse is not always true, because certain gases, acids, oils, greases, and soaps are present in the sewage works exposure that are not normally present in the water works.

## Silicones

**086703 PROPERTIES OF HIGH TEMPERATURE SILICONE COATINGS.** For purposes of this article, high temperature service is defined as 200 F to 1200 F. Within this extremely broad range, 12 general categories of coatings effectively meet high temperature needs and most employ silicone resins in some form. Silicone resins for high temperature coatings are usually a mixture of organic groups attached to silicone atoms. While there are many factors that can contribute to a coating's resistance to high temperatures, the primary reason why silicone atoms are effective in this service is their excellent bond energy, or energy required to break down their chemical bonds. Silicon-oxygen bonds, for example, are far superior in strength than carbon-carbon bonds, so therefore they stand up to heat and ultraviolet light for a much longer period of time before disintegrating.

**086704 AUGER ELECTRON SPECTROSCOPY AND RUTHERFORD BACKSCATTERING SPECTROSCOPY STUDIES OF TIN AND TIC COATINGS PREPARED BY THE ACTIVATED REACTIVE EVAPORATION PROCESS.** TiN<sub>x</sub> and TiC<sub>x</sub> films were deposited by the activated reactive evaporation process under different process conditions. The films were studied by Auger electron spectroscopy and Rutherford backscattering spectroscopy (RBS); standards were used for both techniques. The RBS techniques showed low sensitivity to carbon and nitrogen when 1.8 MeV He<sup>+</sup> ions were used. The sensitivity was enhanced by using 1.5 MeV H<sup>+</sup> ions, but the resulting non-Rutherford scattering necessitated the use of standards although RBS is potentially a standardless method. A correlation was found between the chemical composition of TiN<sub>x</sub> and TiC<sub>x</sub> films and the partial pressures of N<sub>2</sub> and C<sub>2</sub>H<sub>2</sub> respectively. (Author abstract) 16 refs.

**086705 CATHODIC DELAMINATION OF EPOXY/POLYAMIDE COATINGS FROM STEEL.** X-ray photoelectron spectroscopy (XPS) has been used to determine the mechanisms responsible for the debonding of epoxy/polyamide coatings from steel during cathodic delamination in 3.5% aqueous NaCl solutions. Failure always occurred near the interface between the coating and the oxide. The nitrogen content of the free surface of the as-prepared coating was about 10%. However, the nitrogen content of the free surface dropped to only 5% after exposure to 1N NaOH for four weeks and that of the coating failure surface after cathodic delamination was only about 2%, implying that the failure involved degradation of the polyamide curing agent by hydroxide ions formed at the steel surface by the reduction of oxygen. **086707 MODIFICATION OF SURFACE MORPHOLOGY OF SOLIDS BY ION-BEAM SPUTTERING.** It is the purpose of this letter to present and discuss the main questions concerning this problem, i.e. to give a relatively full picture of what author calls the modification of surface morphology of solids by ion-beam sputtering. It seems that the problem of ion-bombardment modification of surface morphology of solids with its various aspects is very interesting and important from the theoretical point of view, as well as very promising from the practical applications point of view. Therefore further studies in this field are necessary. 10 refs.

**086709 RF OSCILLATIONS IN dc PLANAR SPUTTERING MAGNETRONS.** Many types of oscillations are possible in magnetized plasmas. Two frequencies were observed corresponding to waves travelling along and across the magnetic field lines. Measurements of these frequencies gave a value for the electron density of  $2 \times 10^{15}$  m<sup>-3</sup>. The waves travelling along the field lines only occurred with low magnetic field strengths and high magnetron currents. Low magnetic field strengths should be avoided when designing magnetrons for use at high currents. (Edited author abstract). 4 Refs.

**086710 HIGH RATE REACTIVE SPUTTERING PROCESS CONTROL.** Reactive sputtering is usually a slow process because the reactive gas interacts with the target, and in this poisoned state the deposition rate drops off. Pulsing the reactive gas led to improvements in the reactive deposition rate. At fast pulsing rates (0.2 s on, 0.2 s off), the reactive deposition rate for TiN is almost the same as that for metallic titanium, but control of the process is difficult. Implementation of closed-loop feedback control systems using the nitrogen peak height (partial pressure) from a mass spectrometer as the control

signal to the reactive gas mass flow controller brought the process under control and also removed the need for pulsing. (Edited author abstract) 19 refs.

**086711 REACTIVE MAGNETRON SPUTTERING OF TIN: ANALYSIS OF THE DEPOSITION PROCESS.** The pumping speed of the vacuum system and the location of the gas inlet are two parameters which play a prominent part in the production of titanium nitride by reactive magnetron sputtering. In general it is observed that as the nitrogen flow is progressively introduced into the plasma there is an abrupt increase in the total system pressure. This disturbing, albeit slowly reversible, phenomenon, which corresponds to the rapid formation of nitride on the entire target surface, has to be minimized in order to obtain easier control of the coating process. In this transition zone it is possible to obtain a more progressive variation of the total pressure by locating the nitrogen inlet next to the pumping device and/or by increasing the pumping speed. In this way, the nitriding process appears to be rapidly reversible, and the resulting nitride composition undergoes very slow variation with an increasing nitrogen flow rate. (Edited author abstract) 6 refs.

**086713 TECHNICAL NOTE: DESIGN AND PERFORMANCE OF A MOVABLE POST-CATHODE MAGNETRON SPUTTERING SYSTEM FOR MAKING PBFA II ACCELERATOR ION SOURCES.** This paper primarily addresses the design of a post-cathode sputter deposition system designed specifically to deposit films for the PBFA II ion diode source. A post-cathode magnetron sputter deposition system is described for depositing one-, two- or three-layer coatings with uniform thickness and film properties on the inside of a cylindrical substrate. The system uses a unique movable post-cathode which allows the substrate to remain stationary during the deposition process. Film stress is controlled by cycling the sputtering pressure during the sputter deposition process. 22 refs.

**Stripping** See Also GALVANIZED METAL—Corrosion.

**086715 PLASTIC BLAST MEDIA. AN ALTERNATIVE TO CHEMICAL STRIPPING.** Of the estimated 300 million-plus tons of hazardous waste produced annually in the United States, a notable portion derives from the chemical stripping agents methylene chloride and phenol compounds, widely used by both military and commercial operations. Together, they generate one-billion gallons of wastewater and 30-million gallons of hazardous solid wastes. Some industries have been searching for non-chemical alternatives since the mid-1970's. Lasers, carbon dioxide pellets and flash lamps were explored for their possibilities as substitutes, along with the more common methods of hand and power disc sanding. To varying degrees, each method proved either overly costly, ineffective, or damaging to the substrate. Abrasive blast cleaning seemed to hold the most promise.

**Structure**

**086716 MONTE CARLO SIMULATION OF THE LAMELLAR STRUCTURE OF THERMALLY SPRAYED COATINGS.** The structure of thermally sprayed coatings is principally characterized by its lamellar nature and more or less high porosity. This structure is created by impacting molten or highly plastic particles on the substrate surface or existing partial coating. The process by which discrete molten particles impact at random points within a surface area can be simulated using the Monte Carlo method. An appropriate computation model is presented. Structural parameters such as the size of the lamellae, their orientation with respect to the substrate surface and the variation in lamellar orientation over the coating cross-section are determined using simulated coating structures. The impact energies of the spray particles at the moment of impact serve as input data to the model. The results of simulation can be used to interpret phenomena observed in real plasma-sprayed coatings such as substrate-near crack propagation in adhesive strength tests and energy-dependent adhesive strength test values. **Synthesis**

**086718 HYDROCARBON SOLVENTS IN HIGH SOLIDS COATINGS.** In this paper, alkyd and polyester

high solids coatings formulated with a combination of aromatic hydrocarbon and oxygenated solvents are compared to the same coatings formulated only with oxygenated solvents. The properties investigated were solubility, volatile organic compound (VOC) content, viscosity, rheology, sprayability, and final film properties. It was found that substituting hydrocarbon solvent for some of the oxygenated solvent reduced the viscosity and volatile organic compound content of the high solids coatings without compromising performance. The substitution also substantially reduces cost; aromatic solvents cost about \$2.00 per gallon less than the oxygenated solvents they replace. (Edited author abstract) 3 refs.

**086721 COMPARATIVE ANALYSIS OF METHODS OF DETERMINING THE SEPARATING STRENGTH BETWEEN SPRAYED-ON COATINGS AND THE SUBSTRATE.** The separating strength between a sprayed-on coating and the substrate is one of the basic indices determining the durability of coated parts under real conditions. When the adhesive strength is determined by the method of the annular layer, the stress concentration is smaller than in tests using the pin method or an annular pin. The maximal stresses in the coating arise in the layers that are farthest from the base layer of the material. In order to prevent the sprayed-on material from getting into the gap between the ring and the substrate, the taper angle has to be kept within the limits 30-60°. 7 refs.

**086722 UNLUBRICATED SLIDING WEAR BEHAVIOUR OF NICKEL DIFFUSION-COATED Ti-6Al-4V.** Electroless Ni-P alloy was deposited onto a commercial Ti-6Al-4V substrate and diffusion-treated at 1123 K for 7 h. Unlubricated sliding wear tests were

performed in air using upper and lower disk-shaped specimens both rotating in the counter-clockwise direction with a relative sliding velocity of  $0.6 \text{ m s}^{-1}$  and loads of 2.5 - 5 kgf. Coated and uncoated specimens were tested against a counterface made out of heat-treated 52100 steel. The wear rate of the coated specimens was significantly lower than that of the uncoated specimens. Examination of the wear tracks, wear debris and subsurface structure indicated that these two materials wear by entirely different mechanisms. (Edited author abstract) 13 refs.

Lu, Guang-Xi (Jilin Inst of Engineering, Changchun, China); Liu, Jing-Rong. *Wear* v 121 n 3 Feb 1 1988 p 259-269.

**086723 WEAR AND FRICTION OF POLYVINYL CHLORIDE COATINGS UNDER FRETTING CONDITIONS.** The purpose of this study was to investigate the effects and interactions of load, frequency and amplitude of slip, humidity, and film thickness on the coating life and coefficient of friction of a 52100 steel ball oscillating on polyvinyl chloride coated 1045 steel disks. A two-level, five-factor experiment with two replicates per condition was performed. An analysis of variance of the film life indicated that 26 main effects and interactions were significant at the 99 percent level. Humidity was the most significant factor; at low humidity the mean film life was 15 times that at high humidity. Load and the interaction of load and humidity were the next most significant effects. The initial and final coefficients of friction were most significantly affected by the film thickness. (Author abstract) 19 refs.

**Thermal Effects** See Also ELECTRIC CONDUCTORS, WIRE—Soldering.

**086725 EFFECT OF THE RADII OF CURVATURE OF PARTS AND THE THICKNESS OF VITREOUS-ENAMEL COATINGS ON THERMAL STABILITY.** An analysis of failures of enameled chemical units showed that they often break down because of thermal stresses. Thermal fractures appear as a result of sharp heating or cooling of the walls of the enameled unit during use. An equation is derived which can be used to determine the value of the permissible pressure drop of the enameled equipment for a preassigned number of thermal-loading cycles (not less than 100) to fracture of the unit. Test results show that an increase of the thickness of the UES-300 coating from 0.9 to 2.5 mm with a temperature drop of 120-140°C does not significantly affect the decrease of the thermal stability. This effect is more significant at 160-200°C. The curves for determination of thermal stability of the coatings make it possible to estimate the permissible temperature drop of the wall of actual units. The thermal stability of UES-300 and UES-200 coatings at 100 thermal-loading cycles corresponds roughly to the value of the permissible temperature drop of walls of actual units included in technical specifications for enameled equipment. The results were used to develop standard STP 0181-118-82. 3 refs.

**086726 TRANSIENT THERMAL LOAD EFFECTS ON COATINGS BONDED TO CYLINDRICAL SUBSTRATES AND CONTAINING CIRCUMFERENCE**

**TIAL CRACKS.** The effect of a transient thermal load on a coating which is bonded to a cylindrical substrate is analyzed using fracture mechanics by considering the presence of a circumferential edge crack normal to the inner boundary of the coating. The solution is obtained using the finite element method and is compared to the exact solution of the problem. The analysis is then used to show that smaller heat transfer rates at the boundary result in smaller stress intensity factors. For three different materials combinations, including two ceramic coatings on metal, the nondimensional stress intensity factor has a similar magnitude for short crack lengths, but varies appreciably as the crack length becomes longer. It is also determined that inner coatings result in smaller or comparable stress intensity factors than thicker ones. (Author abstract) 13 refs.

#### Thermal Properties

**086728 PARTING COATING WITH SPECIAL PROPERTIES.** The strength of molding sand in the cold and heated states according to the results of standard tests is not identical to the strength of real molds and cores. The latter depends on the degree of compaction and the properties of the antipickup coatings. Resin mixtures at low heat stability of the binder have a tendency toward cracking, which leads to the formation of notching. It follows from the cited data that during operation of the mold under extreme conditions the strength of modern molding sands is inadequate and there is a need to strengthen them with a parting paint or by impregnation. On standard specimens the authors investigated the effect of parting paint (composition, parts by weight: binder 40, filler 58 and stabilizer 2) on the strength of resin (furan) and liquid glass mixtures for 24 hours and during prolonged storage. 1 ref.

#### Vacuum Application

**086731 MANAGEMENT OF WATER VAPOR IN HIGH VACUUM SYSTEMS.** Water is the primary component of the atmosphere in almost all vacuum systems. Because of its negative effect on attainable pressure and its interference in process chemistry, it is crucial to understand the different sources of water in vacuum systems and the difficulty of removing it. In most applications, the limiting source is water adsorbed on vacuum chamber walls which clings tenaciously and evolves slowly. If atmospheric water vapor can condense and form puddles, this source may control attainable pressure and the water removal rate. In all cases, the use of high vacuum pumps with high net realized water vapor speed in the chamber is essential to improvements in both throughput and yield. 2 Refs.

**086734 TECHNICAL NOTE: OPTICAL PROPERTIES OF REACTIVELY EVAPORATED  $\text{SiO}_2$  FILMS.** In an industrial plant engineered for coating substrates  $1.8 \times 2.2$  m in size, we have evaporated  $\text{SiO}_2$  to produce interference layers and protective coatings. The distance between evaporator and substrate is 85 cm. In the residual gas the water vapor dominates as a reactive gas. Compared with arrangements with a shorter distance between evaporator and substrate, and oxygen as a reactive gas, these conditions brought about distinct variations in refractive index, ultraviolet transmission and absorption measured at a wavelength of about  $10 \mu\text{m}$  as far as their dependence on the impact ratio is concerned. These differences are attributed to chemisorption of the reactive gas component during the formation of the film. (Edited author abstract) 15 refs.

**086737 WATER-BORNE COATINGS FOR INDUSTRIAL MAINTENANCE: PART I. REVIEW OF GOVERNMENT AND INDUSTRY EVALUATIONS.** Use of water-borne coatings is one of the major approaches for complying with increasing restrictions on the use of volatile organic compounds. Water-borne coatings offer definite advantages for light to moderate duty maintenance, and show some potential for eventual use in heavy-duty maintenance application. Water-borne coatings will probably never completely afford all the advantages in terms of application and formulation latitude of solvent-borne coatings. In the last five to ten years, however, there have been enormous strides made in the application and performance properties of these systems. Similar improvements are expected in the next decade. 11 refs.

**086738 WATER-BORNE COATINGS FOR INDUSTRIAL MAINTENANCE: PART II. RECENT EXPERIENCE WITH ACRYLIC MAINTENANCE FINISHES.** In a climate of regulatory pressures, the overall balance of properties that is available from water-borne finishes is receiving much attention. Based on positive statements from end users, commercial water-borne products are a viable option to consider when specifying coatings for the protection of steel structures. While experience has demonstrated that water-borne coatings can be effective for protection of steel in mild environments, this paper presents cases suggesting that recently developed water-borne coating materials may be suitable for more aggressive environments, such as chemical exposure in industrial plants. More information is needed, of course, to verify the promise suggested in these cases, but they call attention to the need for additional assessment of the range of capability to be found in current proprietary formulations. 2 refs.

**086740 TWO BREAKTHROUGHS IN WATER-BORNE EMI/RFI COATINGS.** A breakthrough in the efficiency of waterborne conductive coatings has been reported for electromagnetic interference/radio frequency interference (EMI/RFI) applications. The innovation improves shielding at low coating thickness. The key to the breakthrough is in new proprietary ways to disperse fine powders containing nickel and other conductive materials. The high conductivity permits effective shielding with 2 mils of coating (dry film thickness). Conductivity of the coating is in the range of 0.02 to 0.9 ohm per square. Also discussed is a 'new generation' coating for EMI/RFI shielding of plastic housings containing electronic equipment.

**086741 WEAR CHARACTERISTICS OF EUTECTIC-ALLOY GASOTHERMAL COATINGS.** We present the results of a study of the structure, phase composition, and antifriction properties of gasothermal coatings consisting of iron-base eutectic-alloy powders alloyed with aluminum and titanium. We note the hereditary nature of the morphology of the eutectic colonies of the powder and coating structure. It is shown that a characteristic feature of the failure of the eutectic-alloy gasothermal coatings in boundary friction is increase of the surface porosity, the value of which is determined by the degree of heterogeneity of the structure. (Author abstract) 12 refs.

**086742 COATING WEAR IN ELASTIC JUNCTIONS WITH VARIABLE CONTACT AREA.** We study theoretically the wear of a thin elastic coating with variable contact area and examine the cases of a foundation in the form of an elastic halfplane and a circular cutout in an elastic plane (sliding bearing). We identify the existence of a steady-state wear regime, when the pressure pattern takes a very definite form. On the basis of numerical analysis we substantiate the model with a rigid

shaft and bushing. (Author abstract) 7 refs.

Soldatenkov, I.A. *Sov J Frict Wear* v 8 n 2 1987 p 8-13.

**086743 WEAR RESISTANCE OF TWO-LAYER COATINGS IN LUBRICATED FRICTION.** We present the results of studies of the wear resistance and the friction coefficients of two-layer coatings with low melting Sn, Cd, Zn sublayers at varying temperatures and loads under lubricated friction conditions. The comparative studies show that thanks to the damping capability of the low-melting sublayer increase of the wear resistance of the outer coating layer (OCL) by 20-40% is possible. This makes it possible to recommend the two-layer coatings with low-melting sublayers for wide industrial use. (Author abstract) 6 refs.

**086747 EFFECT OF PROTECTIVE COATINGS UNDER THE EFFECT OF A GAS-ABRASIVE MEDIUM.** The paper discusses the results of studies of plasma coatings M1, M2,  $\text{PN55T45}$ ,  $\text{PN65T35}$  subjected to wear under the effect of a gas-abrasive medium. Wear regularities are established for coatings under varying angle of attack of the gas-abrasive flow of particles. The wear mechanism of porous coatings is compared with that of carbon steel 45. The relation between the wear rate of gas-thermal coatings and the level of their cohesion

strength is found. Recommendations are given on application of the investigated coatings subjected to the effects of gas-abrasive media. (Author abstract). In Russian.

**086749 OPTICAL INTERFERENCE EFFECT IN THE LASER CHEMICAL VAPOR DEPOSITION OF SiC.** Because it is an attractive material for use in selected area deposition of hard and wear-resistant coatings, SiC was chosen as a model for the investigation of compound growth via laser chemical vapor deposition (LCVD). In these experiments, the reactants consisted of SiH<sub>4</sub> plus CH<sub>4</sub> mixtures with various silicon-to-carbon ratios and the substrate was made of hot-pressed SiC. A continuous wave (c.w.) line-tunable CO<sub>2</sub> laser operating at 9.27 μm (single-mode, TEM 00) provided a beam of the desired characteristics for this particular deposition system. The initial stage of the macroscopic growth is generally accompanied by the formation of some isolated droplet-shaped islands across the irradiated site. Interacting with the incident beam, these surface features generate a surface electromagnetic wave (SEW). A coupling between this SEW and the primary beam results in an interference effect. A periodic substructure appears on top of the deposited films as the growth continues. This substructure upgrades the frictional characteristics of these wear-resistant coatings. **086751 DEPOSITION AND PROPERTIES OF MULTICOMPONENT HARD COATINGS.** A systematic investigation of the properties of ternary nitrides and carbonitrides is presented. Alloys of titanium, zirconium, hafnium, vanadium, niobium, chromium and aluminum were selected for the preparation of targets. Coatings of ternary nitrides and carbonitrides, deposited by magnetron sputtering are examined. It was found by X-ray diffraction analysis that most of the deposits have cubic structures with a solid-solution distribution of the metal

atoms. Very hard coatings were obtained in the Hf-Ti-N and V-Ti-N systems. Zr-Ti-N coatings showed good resistance and performance in cutting tests. The results of the investigations show that coatings of this class of compounds exhibit properties well suited to providing cutting tools with better protection against wear. (Edited author abstract) 12 refs.

**086752 KNOWLEDGE-BASED EXPERT SYSTEMS IN SURFACE COATING AND TREATMENT SELECTION FOR WEAR REDUCTION.** Most engineering failures occur because of surface initiated effects such as wear, corrosion and fatigue. Surface coatings and treatments specified at the design stage thus offer considerable potential to prevent failure and reduce costs. However, few design engineers possess the comprehensive knowledge needed to specify optimum surface coatings and there is no recognized procedure for selection which can be universally adopted. With the advent of computer systems which can manipulate and store large amounts of data at low cost, a solution to this problem is now at hand. We report the development of a knowledge-based computer system to aid the designer in this crucial area. The paper presents the methodology behind the coating/treatment selection process, and outlines the knowledge used at the various solution stages, emphasizing wear reduction. The main selection criteria are presented and the industrial application of the system is discussed. (Author abstract) 13 refs.

**086753 PERFORMANCE OF TIN-COATED TOOLS IN WOOD CUTTING.** The possibility of using titanium nitride (TiN) as a wear-resistant coating in wood cutting was investigated. Three types of TiN-coated tungsten carbide tipped circular saws were compared by sawing under normal production conditions. The thickness of the coatings varied from 0.7 to 1.0 μm. The sawn materials were hardboard, polyvinylchloride coated particleboard, waste paper based paperboard and plywood. Coated high speed steel (HSS) cutter heads were also tested in the cutting of spruce. All coatings were deposited by reactive triode ion plating. The coating reduced the wear on the rake face about 50% when sawing hardboard. (Edited author abstract) 6 refs.

**086754 CATHODE-SPOT ARC COATINGS: PHYSICS, DEPOSITION AND HEATING RATES, AND SOME EXAMPLES.** Cathodic arc coatings have found their way into industrial applications, particularly in using a titanium cathode in a low pressure nitrogen background gas to produce hard TiN coatings, which give superior wear protection to cutting tools. This paper reviews the basic physics of the cathode-spot arc, and applies the information available to frame simple models from which the deposition rate and energy flux can be estimated. The paper concentrates on the vacuum arc for which more extensive data are available. A preliminary rough model for the less researched case of a cathode-spot arc in a low pressure background gas is also presented. The models are illustrated with reference to laboratory cathode-arc coating experiments. 34 refs.

**086755 FRICTION AND WEAR BEHAVIOUR OF**

**THERMALLY SPRAYED NICHROME-WC COATINGS.** Four types of nichrome-WC sprayed coatings (85%, 55%, 15% and 5% WC) were studied by means of Falex dry friction and wear tests. Significant sudden drops in the friction force were recorded; from the morphological study of the worn surfaces it was determined that these friction force variations correspond to the removal of WC particles. This interpretation was substantiated using a reliability model to estimate the mean lifetime of a WC particle and its surrounding media as a function of the experimentally determined frequency of the friction force drops, width of the wear scar and the diameter and density of WC particles. (Author abstract) 10 refs.

**086756 WEAR AND EROSION RESISTANCE OF HARD PVD COATINGS.** The abrasive and erosive wear behavior of titanium nitride coatings prepared using physical vapor deposition has been studied and the mechanism(s) by which the coatings fail identified and contrasted with those of uncoated material similarly treated. For abrasive wear it is not sufficient to consider only hardness as a guide to coating selection; it is also important to consider the load-bearing capacity of the coating/substrate system. Under erosion conditions it is found that thick coatings are more resistant to angular particle erosion while thin coatings have longer lifetimes when exposed to blunt erodents. (Edited author abstract) 37 refs.

**086757 MECHANICAL STRENGTH AND TRIBOLOGICAL BEHAVIOR OF ION-BEAM-DEPOSITED BORON NITRIDE FILMS ON NON-METALLIC SUBSTRATES.** An investigation was conducted to examine the mechanical strength and tribological properties of boron nitride (BN) films ion-beam-deposited on silicon, fused silica (SiO<sub>2</sub>), gallium arsenide (GaAs) and indium phosphide (InP) substrates in sliding contact with a diamond pin under a load. The results of the investigation indicate that BN films on non-metallic substrates, like metal films on metallic substrates, deform elastically and plastically in the interfacial region when in contact with a diamond pin. However, unlike metal films and substrates, BN films on non-metallic substrates can fracture when they are critically loaded. Not only does the yield pressure (hardness) of silicon and SiO<sub>2</sub> substrates increase by a factor of two in the presence of a BN film, but the critical load needed to fracture also increases. The presence of films on the brittle substrates can arrest crack formation. The BN film reduces adhesion and friction in the sliding contact. BN adheres to silicon and SiO<sub>2</sub> and forms a good quality film, but it adheres poorly to GaAs and InP. (Author abstract) 21 refs.

**086758 COATINGS FOR FRICTION AND WEAR CONTROL AT HIGH TEMPERATURES.** One way to achieve both the wear resistance of hard coat materials and low friction is to develop coating materials that are composites of hard materials for wear control and solid lubricants for friction control. Using this approach, a series of composite coatings (the PS200 series) was developed at NASA Lewis Research Center. The compositions contain chromium carbide for wear control, calcium fluoride-barium fluoride eutectic and silver for friction control, and nickel alloy binder. The optimized

coatings in this series are lubricative from room temperature (or lower) to 900°C in oxidizing or reducing atmospheres. (Edited author abstract) 4 refs.

**086759 CAVITATION-EROSION RESISTANCE OF ION PLATED Cr-TiN MULTILAYER COATING.** Ion plated Cr-TiN multilayer coatings showed good cavitation-erosion resistance. To determine the reason for this improved behavior, a detailed study of the deposition conditions was carried out. It was shown that the coating conditions for desired cavitation-erosion resistance depended on the surface roughness of the substrate, deposition temperature and substrate bias voltage. Strong adhesive force at the bonded layer, high compressive residual stress in the coating, and small grain size and proper preferred orientation of the coating were found to contribute to cavitation-erosion resistance. (Author abstract) 9 refs.

**086760 TECHNICAL NOTE: A GYRO SPIN AXIS BEARING PERFORMANCE USING TITANIUM CARBIDE COATED BALLS.** In the gyroscope bearings investigated the primary failure mode was lubricant thickening and hardening through an oxidation-polymerization process. Some of the intermediate compounds are ferro-organic, the iron being provided by the bearing balls and races from normal asperity wear. The bearing balls were replaced with balls having a titanium carbide coating applied by a chemical vapor deposition process as a means of preventing metallic wear by virtue of the high surface hardness and insolubility of TiC in iron. This scheme succeeded and wear was completely arrested thus interrupting the supply of free iron to the lubricant. Upon examination after operation for 5600 h there was no degradation of the lubricant found. (Author abstract) 3 refs.

**086761 COMPOSITION, STRUCTURE AND WEAR RESISTANCE OF Ti-6Al-4V IMPLANTED WITH CARBON OR BORON TO HIGH DOSES.** High-dose ion implantation of carbon or boron into Ti-6Al-4V alloy produced flat-topped concentration profiles indicating considerable solute redistribution. Carbon implantation produced precipitates of TiC, which became a continuous layer at the highest doses. This layer showed very high abrasion resistance, at least 70 times that of the substrate. Boron implantations generated increasingly dense layers of TiB<sub>2</sub> dispersed in amorphous titanium. Boron and lower-dose carbon provided appreciable increases in wear resistance (by about ten times). Wear of these ultra-adherent but thin layers (less than 300 nm) was not uniform. (Author abstract) 31 refs.

**086762 TRIBOLOGICAL BEHAVIOUR OF SOME ALLOYS AFTER SURFACE MODIFICATION USING ION BEAM TECHNIQUES.** Two types of ion beam surface modifications have been performed. (i) Superficial amorphization has been induced in an industrial NiTi shape memory alloy by direct ion implantation. A remarkable increase in the wear resistance and exceptional reduction in the friction coefficient has been observed for an implantation of  $3 \times 10^{17} \text{ N}^+ \text{ cm}^{-2}$ . (ii)

An FeAl coating 1  $\mu\text{m}$  thick on steel has been obtained by iron and aluminum evaporation simultaneously with argon ion irradiation. This coating significantly improves the tribological behavior of this steel and presents an exceptional adherence to the substrate, which is not so if the coating is performed without ion assistance. (Author abstract) 9 refs.

**Weathering** See Also COATINGS—Testing; CONCRETE—Protective Coatings.

**086764 NEW DEVELOPMENTS IN WEATHER RESISTANT POWDER COATINGS.** The flow of thermoset powder coatings depends on a number of factors, including the selection of suitable pigments and fillers, pigment concentration, additives such as flow agents, bake schedule, reactivity and structure of the resinous components, melt viscosity, and the viscosity profile during crosslinking. This paper reports about recently developed carboxyl terminated triglycidyl isocyanurate (TGIC) cured polyesters which result in powder coatings with remarkably improved flow properties due to the polyester's molecular structure and functionality and the viscosity profile during the curing process. These improvements have been reached without any prolongation of the gel time and without compromising the weathering resistance of the film. Such new powder coatings completely crosslink at 160°C within 15 minutes yielding films with excellent mechanical properties. (Author abstract). 5 Refs.

**086765 ROLE OF PROTEIN STRUCTURE IN CHROMATOGRAPHIC BEHAVIOR.** Chromatographic retention is determined by a relatively small number of amino acids located in a chromatographic contact region on the surface of a polypeptide. The contact area may be as small as a few hundred square angstroms in bioaffinity chromatography. In contrast, the contact region in nonbioaffinity separation modes is much broader, ranging from one side to the whole external surface of a polypeptide. Furthermore, structural changes that alter the chromatographic contact region will alter chromatographic properties. Thus, although immunosorbents can be very useful in purifying proteins of similar primary structure, they will be ineffective in discriminating between small, random variations within a

structure. Nonbioaffinity columns complement affinity columns in probing a much larger portion of solute surface and being able to discriminate between protein variants. (Edited author abstract) 38 refs.

**086766 STUDIES ON APPLICATION OF THE AVIDIN-BIOTIN HIGH AFFINITY SYSTEM.** The affinity of an egg white protein (avidin) and biotin (vitamin H) is characterized by a large value of the association constant ( $10^{15} \text{ M}^{-1}$ ). The application of this high affinity system to enzyme immobilization was investigated. Urease was immobilized on the beams of polyvinyl alcohol (Toyopearl: TPL) by means of avidin-biotin coupling. The immobilization procedure included four steps as follows: preparation of biotinyl-TPL; binding of avidin to biotinyl-TPL; preparation of biotinyl-urease; and binding of biotinyl-urease to avidin-coupled biotinyl-TPL. Immobilized urease retained enzymatic activities. (Edited author abstract) In Japanese. 3 refs.

**086767 THEORETICAL CALCULATION OF RELATIVE AFFINITIES IN PROTEIN-SUBSTRATE BINDING.** Determination of the three-dimensional structures of several binding proteins from Gram-negative bacteria has been carried out. These proteins, which are located in the periplasmic space, serve as essential components of osmotic shock-sensitive active transport systems for a large variety of carbohydrates, amino acids and ions. Several of the sugar-binding proteins also act as initial receptors for chemotaxis. With the highly refined structure of L-arabinose-binding protein (ABP) and experimental values of free energies of binding for L-arabinose and various deoxyarabinoses, an attempt is made to compute the difference in the relative free energy change for binding of different substrates using the thermodynamic cycle-perturbation method. By this technique, it becomes possible to quantitatively assess the contribution of individual hydroxyl-protein interactions to the overall binding energy of the sugar substrate.

**086768 ARIADNE: PATTERN-DIRECTED INFERENCE AND HIERARCHICAL ABSTRACTION IN PROTEIN STRUCTURE RECOGNITION.** ARIADNE was developed as a hierarchical pattern-directed inference system for the ill-structured problem area of protein structure analysis. The system (ARIADNE) identifies the optimal match between a given complex pattern descriptor and genetic (protein) sequences annotated with various inferred properties, by abstracting intermediate levels of structural organization. Inference is grounded solely in knowledge derivable from the primary sequence, and exploits such weakly inferred properties as secondary structure predictions and hydrophobicity. The proposed aminoacyl-tRNA synthetase alignment and functional domain identification is new and was found using this system with a hypothesized descriptor. 50 refs.

**086769 METHOD FOR THE RADIOHALOGENATION OF PROTEINS RESULTING IN DECREASED THYROID UPTAKE OF RADIOIODINE.** A procedure is described for the radioiodination of proteins using an iodinated derivative of N-succinimidyl 3-(tri-n-butylstannyl) benzoate (ATE). Adequate removal of unreacted ATE from [<sup>125</sup>I]ATE was necessary for optimal protein radioiodination. Labeling efficiencies of greater than 60% could be obtained after a 20 min incubation of goat IgG with [<sup>125</sup>I]ATE at 4°C. Paired-label experiments with goat IgG labeled with [<sup>125</sup>I] using ATE and [<sup>131</sup>I] using Iodogen

demonstrated that use of the ATE reagent for protein labeling significantly reduced ( $P < 0.005$ ) the thyroid uptake of radiiodine. (Author abstract) 16 refs.

**086770 RAPID AND EFFICIENT PHYSIOLOGIC CHEMICAL METHOD OF LABELING PLASMA PROTEINS WITH INDIUM-111.** A rapid physiologic chemical method had been developed for labeling plasma proteins with  $^{111}\text{In}$ . Human serum albumin, IgG, fibrinogen, transferrin, lactoferrin and the enzyme bovine thrombin had been successfully labeled with exceptionally high labeling yields of greater than 98%. In vitro bioassays confirmed that  $^{111}\text{In}$ -fibrinogen and  $^{111}\text{In}$ -thrombin retained 96-99% of their biochemical activities after labeling with the radionuclide. All radiolabeled proteins were stable at 2-8°C in excess of 3 week periods without elution of the 'label' or any significant loss of biological activity. (Author abstract) 16 refs.

**086772 MODELS FOR STRONG INTERACTIONS IN PROTEINS AND ENZYMES: 1. ENHANCED ACIDITIES OF PRINCIPAL BIOLOGICAL HYDROGEN DONORS.** The acid dissociation energies of several key biological hydrogen donors are found to fall into a narrow range,  $\Delta H^\circ_{\text{acid}} = 352\text{-}355$  kcal/mol. The strong acidities of these donor groups enhance the hydrogen bond strengths involved in the protein  $\alpha$ -helix, imidazole enzyme centers and DNA. Specifically, the peptide link is modeled by the dipeptide analogue  $\text{CH}_3\text{CO-Ala-OCH}_3$ . Its acidity is strengthened, i.e.,  $\Delta H^\circ_{\text{acid}}$  is decreased by 8 kcal/mol compared with other amides, due to electrostatic stabilization by the second carbonyl in the peptide  $-\text{CON}-\text{CH}(\text{CH}_3)\text{CO}-$  grouping. The acidity of imidazole is also strengthened by 8 kcal/mol compared with that of the parent molecule, pyrrole, primarily due to resonance stabilization of the ion. (Edited author abstract) 23 refs.

Meot-Ner, Michael (NBS, Gaithersburg, MD, USA). *J Am Chem Soc* v 110 n 10 May 11 1988 p 3071-3075.

**086773 MODELS FOR STRONG INTERACTIONS IN PROTEINS AND ENZYMES: 2. INTERACTIONS OF IONS WITH THE PEPTIDE LINK AND WITH IMIDAZOLE.** Cluster ions provide an experimental measure of ionic interaction energies in proteins. Peptide links, modeled by the alanine derivative  $\text{CH}_3\text{CO-Ala-OCH}_3$ , are strong hydrogen donors and bond by 30 kcal/mol to anions such as  $\text{RCOO}^-$  and  $\text{Cl}^-$ . The protein environment as modeled by two peptide amide groups stabilizes an anion by about 45 kcal/mol and a cation by about 50 kcal/mol. Therefore, in general, a protein backbone can stabilize a charge-separated ion pair by 90-110 kcal/mol. Applying clustering results to a specific biological system, anionic centers in the active site of serine proteases are examined. The model suggests that the aspartate carboxyl of the enzyme is solvated by four hydrogen bonds by about 65 kcal/mol, and the tetrahedral oxyanion intermediate is stabilized by hydrogen bonds to two peptide links by about 30 kcal/mol. (Edited author abstract) 18 refs.

**086774 NMR OF SILK FIBROIN. 8.  $^{13}\text{C}$  NMR ANALYSIS OF THE CONFORMATION AND THE CONFORMATIONAL TRANSITION OF PHILOSAMIA CYNTHIA RICINI SILK FIBROIN PROTEIN ON THE BASIS OF BIXON-SCHERAGA-LIFSON THEORY.** The helicity of each residue for the sequence of the alanine residues in Philosamia cynthia ricini silk fibroin protein, where the number of the alanine residues were determined as 22, was calculated by using the Bixon-Scheraga-Lifson theory for the helix-coil transition of poly(L-alanine) including the hydrophobic side-chain interactions. The NMR line shape of the carbonyl carbon of the alanine residue observed in aqueous solution was simulated on the basis of the helicity of the alanine sequence determined here. In addition, the change in the NMR spectra of the alanine carbonyl region due to the temperature-induced helix-coil transition was also interpreted in terms of the change in the statistical weight parameter  $w$ , where  $w$  is related to the formation of an intramolecular hydrogen bond. From this theoretical analysis and CD observations, the structure of P.c. ricini silk fibroin in aqueous solution was clarified. (Author abstract) 16 refs.

## Absorption

**086776 PROTEIN ADSORPTION TO HYDROGELS.** Protein adsorption is thought to be one of the more important initial events which occurs upon exposure of solid surfaces to the biological environment. Many different types of observations have contributed to this conclusion, but it derives most fundamentally from the fact that the rapid formation of a relatively tightly held layer of protein prevents direct contact of cellular elements with the surface. Thus, all of the situations in which solid surfaces interact with biological systems actually involve interactions between the adsorbed protein layer present at the interface and the various other biological elements. As will be seen, measurements of adsorption isotherms, competitive adsorption studies from simple protein mixtures, studies of the types and amounts of protein adsorbed from blood plasma, and characterization of the desorption/exchange reactions all reveal significant differences between hydrogels and nonhydrogels. 68 refs.

**086777 ADSORPTION OF PROTEINS AND HYDRODYNAMIC FLOW OF SOLUTIONS IN THIN CAPILLARIES.** The hydrodynamic rate of flow of a liquid in a flat slot or a cylindrical capillary has been calculated for a two-layer model of flow, in which one layer determines the hydrodynamics of the flow in an

adsorbed protein layer, and the outer layer determines the hydrodynamics in the solution. The resistance created by segments of adsorbed macromolecules can cause a decrease in the flow rate of a liquid through a capillary in comparison to the classical Poiseuille formula in a number of situations. Such a decrease in the experimental flow rate may be interpreted as an apparent increase in viscosity, and thus the main relationships obtained in this work make it possible to explain the Copley-Scott-Blair effect and to propose a quantitative description for it. (Author abstract) 16 refs.

**086779 PROTEIN ADSORPTION AND MATERIALS BIOCOMPATIBILITY: A TUTORIAL REVIEW AND SUGGESTED HYPOTHESES.** A comprehensive review of protein adsorption at solid-liquid interfaces is presented, including a brief review of protein structure and the principles of protein adsorption. Adsorption-based biocompatibility hypotheses and correlations are discussed, including surface charge, interface energetics, passivation, protein-resistant surfaces, and the role of adsorbed immunoglobulins and complement. New methods for the study of protein adsorption are discussed, including total internal reflection techniques (absorbance, fluorescence, and raman) and ellipsometry. Qualitative 'rules of thumb' of protein adsorption are also presented. (Author abstract) 193 refs.

**086780 ADSORPTION DISPLACEMENT OF PROTEINS BY SURFACTANTS IN OIL-IN-WATER EMULSIONS.** The adsorption displacement of  $\beta$ -lactoglobulin and  $\beta$ -casein by water- and oil-soluble surfactants in 50% oil-in-water emulsions was studied with the depletion method. Not only the surface concentration of the protein was measured, but also that of the surfactant. The surfactants may partly or even completely displace the protein from the droplet surface, depending on surfactant concentration and type. This phenomenon is independent of protein type and the way in which the surfactant is added to the system (before or after emulsification) and only slightly depends on the type of oil. Displacement occurs by water-soluble as well as by oil-soluble surfactants. (Edited author abstract) 33 refs.

**086783 PROTEIN ADSORPTION ON FUNCTIONALIZED AND ESCA-CHARACTERIZED POLYMER FILMS STUDIED BY ELLIPSOMETRY.** In a recent ESCA study of protein adsorption we found very low adsorption of bovine serum albumin (BSA) on photopolymerized monoacrylated polyethylene oxide (PEO) films as compared to films of charged hydrophilic films or hydrophobic PVC films. This indicates the importance of both polar/ionic and hydrophobic interactions in protein adsorption. In this paper we have used ellipsometry to investigate the adsorption of BSA,  $\gamma$ -globulin (IgG), fibrinogen, and poly-L-lysine (PLL) to silicon wafers, which were surface modified by attaching PVC, a methacrylic acid/methacrylate copolymer (PMA), or PEO films all of which were characterized by ESCA. 45 refs.

**086785 MOLECULAR AND SUPRAMOLECULAR STRUCTURE OF ADSORBED FIBRINOGEN AND ADSORPTION ISOTHERMS OF FIBRINOGEN AT QUARTZ SURFACES.** The process of protein adsorption to solid surfaces is an important step in the physiological function of plasma proteins in surface induced thrombosis. Fibrinogen adsorbed at solid surfaces has been shown to promote platelet adhesion. The adsorption of fibrinogen to quartz surfaces was measured by ellipsometry, ELISA, and electron microscopy. The initial adsorption at low concentrations was diffusion rate limited as determined by the ELISA and by counting the number of adsorbed molecules at electron micrographs. At a hydrophilic quartz surface a plateau level of the adsorption isotherm was found at a surface concentration of  $0.1 \text{ pmol/cm}^2$  where adsorbed molecules had a mean intermolecular distance of  $10 \pm 5 \text{ nm}$ . At higher surface concentrations the molecules were densely packed and formed a layer where single molecules could not be identified. Adsorbed fibrinogen showed different structure at hydrophobic and hydrophilic quartz surfaces. (Edited author abstract) 20 refs.

**086786 USE OF AN ENZYME LINKED IMMUNOSORBENT ASSAY (ELISA) FOR QUANTIFICATION OF PROTEINS ON THE SURFACE OF MATERIALS.** This study demonstrates the usefulness of an enzyme linked immunosorbent assay (ELISA) for detection and quantification of protein on the surface of materials. Bovine serum albumin (BSA) and bovine gamma globulin (BGG) were the proteins used. Titanium and stainless steel were the materials tested. The proteins were detected with the use of rabbit antiserum specific for BSA and for BGG. This reaction was quantitated by the use of horseradish peroxidase conjugated goat anti-rabbit gamma globulin. The technique is described in detail. The technique was demonstrated to be suitable for quantitation of protein from  $0.01 \text{ mg/mL}$  to  $0.1 \text{ mg/mL}$  on the surface of  $3 \text{ mm} \times 10 \text{ mm}$  materials. The technique was also demonstrated to be suitable for determining the surface area of solid materials. It is a simple technique and suitable for most biomaterials laboratories. (Author abstract) 10 refs.

**086787 ADSORPTION OF  $\alpha$ -LACTALBUMIN AND  $\beta$ -LACTOGLOBULIN ON METAL SURFACES VERSUS TEMPERATURE.** The heating of biological fluids in the food industry often causes deposition (fouling) on the processing equipment. This study is part of a research program directed toward a better understanding of fouling associated with the heat treatment of milk. The adsorption of  $\alpha$ -lactalbumin and  $\beta$ -lactoglobulin on a hydrophilic chromium surface was followed in situ, using ellipsometry. The experiments were performed at temperatures up to and exceeding (in the case of  $\alpha$ -lactalbumin) the thermal denaturation temperatures of the proteins. The two proteins exhibit quite different properties, which makes it interesting to compare their behavior at the solid/liquid interface. 21 refs.

**086788 ADSORPTION KINETICS OF PROTEINS ONTO SOLID SURFACES IN THE LIMIT OF THE INTERFACIAL INTERACTION CONTROL.** We have developed an experimental set-up using radiolabeled proteins for the continuous measurement, as a function of time, of the excess concentration of superficial protein at a solid/liquid interface. The experimental conditions were designed in order to minimize the coupling of the interfacial interaction with bulk diffusion, and therefore to work within the limit of the interfacial interaction control. Chemical kinetics were assumed to follow a Langmuir equation. The adsorption ( $K_a$ ) and desorption ( $K_d$ ) rate constants have been evaluated in the case of fibrinogen and albumin adsorption, onto glass beads and synthetic hydroxyapatite powder, respectively. (Edited author abstract) 38 refs.

**086789 ADSORPTION OF INSULIN ON METAL SURFACES IN RELATION TO ASSOCIATION BEHAVIOR.** The adsorption of insulin on metal surfaces from aqueous solutions was monitored by in situ ellipsometry. Clean (hydrophilic) chromium and titanium surfaces as well as chromium surfaces treated to be hydrophobic were used. The adsorbed amount was found to be higher on the hydrophilic than on the hydrophobic surfaces. The presence of the divalent metal ions zinc and calcium increased the adsorbed amount and also the fraction desorbable upon rinsing. This was related to the behavior in the bulk solution, where zinc and calcium increase the association. The increase in adsorbed amount was observed also when zinc was added to an adsorbed layer of Zn-free insulin in contact with insulin solution. Addition of citrate to an adsorbed layer of insulin from a solution containing four zinc ions per hexamer had an effect similar to that of rinsing, indicating a removal of

zinc in both cases. The effect of the pH was investigated in the range from pH 7 to pH 8. (Author abstract) 40 refs.

**086790 EFFECT OF SURFACE CHARGE ON ADSORPTION OF BOVINE SERUM ALBUMIN: 2. INTERACTION OF PROTEIN MOLECULES WITH AN ANIONIC MONOLAYER, AS STUDIED BY ELLIPSOMETRY, RADIOTRACER AND SURFACE TENSION MEASUREMENTS.** The adsorption of bovine serum albumin (BSA) onto an anionic monolayer of sodium dodecylsulfate (SDoS) spread at the air/water interface was studied by ellipsometry. The adsorption behavior of BSA was estimated from the observed changes in phase differences and in the ratio of reflection coefficients. The dynamic process of BSA adsorption was measured after the injection of BSA solution into the aqueous substrate of SDoS monolayer. The gentle stirring of the substrate solution for 10 min was found to be enough to make the solution homogeneous without damaging the monolayer. The adsorption characteristics of BSA onto a negatively charged surface was compared with that onto a positively charged surface previously reported. The amount of adsorption depended on time and showed a maximum with an initial rapid rise, followed by gradual decrease toward the ultimate equilibrium value. The amount and time of the maximum adsorption depended on the concentration of BSA added to the aqueous substrate. Separate radiotracer measurement, using  $^{35}\text{S}$ -labeled SDoS monolayer, which is insoluble by itself, revealed that SDoS is solubilized into the bulk solution when BSA is added to the aqueous substrate. (Author abstract) 29 refs.

Watanabe, N. (Toyo Ink Mfg Co, Tokyo, Jpn); Shirakawa, T.; Iwahashi, M.; Seimiya, T. *Colloid Polym Sci* v 266 n 3 Mar 1988 p 254-260.

**086791 FLUORESCENCE EMISSION FORM ADSORBED BOVINE SERUM ALBUMIN AND ALBUMIN-BOUND 1-ANILINONAPHTHALENE-8-SULFONATE STUDIED BY TIRF.** Total internal reflection fluorescence (TIRF) spectroscopy was used to analyse the conformational changes of bovine serum albumin (BSA) upon adsorption to silica surfaces. The intrinsic fluorescence emitted by BSA tryptophans and the fluorescence of BSA-bound ligand 1-anilino-naphthalene-8-sulfonate (ANS) were analysed prior to and after the removal of nonadsorbed protein. It was found that the irreversibly adsorbed BSA emits a blue-shifted intrinsic fluorescence (11 nm) and that the surface-adsorbed BSA-bound ANS fluorescence emission is red-shifted (12 nm). It was concluded that the conformational change in adsorbed BSA involves the whole BSA molecule: tryptophans become exposed to a less polar environment while the binding site polarity is increased. (Edited author abstract) 25 refs.

**086792 STUDY OF THE ADSORPTION OF ALBUMIN ON A PLATINUM ROTATING DISK ELECTRODE USING IMPEDANCE MEASUREMENTS.** The study of the adsorption of albumin on a platinum rotating disk electrode was performed using impedance measurements. The kinetics of the adsorption was investigated by recording, during 15 min after protein addition, the variation with time of the electrochemical double layer capacitance,  $C_d$ . The resulting curve was computed and a model of two consecutive reactions occurring at the interface was proposed to describe the adsorption reaction. The corresponding theoretical equation used to fit the data showed five parameters: three capacitances (of the bare surface, of the surface covered with the reversibly

adsorbed proteins, and of the surface covered with the irreversibly adsorbed proteins) and two time constants. (Edited author abstract). 33 Refs.

**086793 PHYSICO-CHEMICAL AND BIOCHEMICAL ASPECTS OF FIBRINOGEN ADSORPTION FROM PLASMA AND BINARY PROTEIN SOLUTIONS ONTO POLYETHYLENE AND GLASS.** The adsorption of fibrinogen to polyethylene and glass from plasma and binary protein solutions was measured using baboon fibrinogen radiolabeled with  $^3\text{H}$ . The effects of plasma dilution, shear rate contact time, and plasma fibrinogen concentration were examined. Fibrinogen adsorption to polyethylene passed through a maximum at times dependent upon the plasma dilution, shifting from 1 h to 10 s as the plasma concentration varied from 0.01 to 100%. Fibrinogen adsorption to glass from solutions containing either albumin or hemoglobin was maximal at intermediate mixture concentrations. The maximum shifted to smaller concentrations as the ratio of competing protein to fibrinogen increased. The effect is similar to that caused by plasma dilution and suggests that the observed fibrinogen displacement phenomenon occurring with plasma results from numerous proteins expressing their stronger affinity for a finite number of adsorption sites. (Edited author abstract). 45 Refs.

Slack, Steven M. (Univ of Washington, Seattle, WA, USA); Horbett, Thomas A. *J Colloid Interface Sci* v 124 n 2 Aug 1988 p 535-551.

**086794 IMMOBILIZATION OF PROTEINS ON ORGANIC POLYMER BEADS.** A new method is described for the immobilization of biologically active proteins onto several types of organic polymer beads. First, the soluble protein is modified by reaction with an excess of a hydrophobic imidoester. Excess imidoester and side products resulting from imidoester hydrolysis are separated from the hydrophobic protein derivative by exclusion chromatography or dialysis. A suspension of polymer beads (e.g. Amberlite XAD-7) is then added to a solution of the modified protein at room temperature or below and stirred gently for 1-2 h. The polymer beads are allowed to settle, separate from the solution by decantation or filtration, washed, and resuspended in an appropriate buffer. Quantitative adsorption of protein to the polymer beads is observed under such conditions. The synthesis of seven hydrophobic imidoesters and their use for the immobilization of trypsin onto several types of porous polymer beads is described. (Edited author abstract). 38 Refs.

Ampon, Kamaruzaman (Ohio State Univ, Columbus, OH, USA); Means, Gary E. *Biotechnol Bioeng* v 32 n 5 Aug 20 1988 p 689-697.

**086795 PROTEIN ADSORPTION ON POLYMERIC BIOMATERIALS I. ADSORPTION ISOTHERMS.** The equilibrium adsorption of seven purified human proteins to four different biomaterials was studied at different protein concentrations under in vitro conditions. The proteins studied were albumin, transferrin, three monoclonal antibodies of different net charge, fibrinogen, and  $\alpha_2$ -macroglobulin. The biomaterials used in the adsorption studies included a polyether urethane urea, polyethylene, silicone rubber, and plasticized polyvinyl chloride. The equilibrium adsorption data for these protein-biomaterial combinations could be fit by a protein adsorption model assuming two or more adsorbed protein layers. The monolayer concentrations of adsorbed protein agreed closely with the theoretical monolayer concentrations based on the macromolecular dimensions of the proteins. From these studies, it is apparent that the magnitude of the binding forces at the liquid-polymer interface is a function of both the biomaterial composition and the individual protein. (Edited author abstract). 37 Refs.

**086796 KINETIC ANALYSIS OF PROTON TRANSPORT IN BACTERIORHODOPSIN-LIPIDOMES BASED ON BILATERAL pH DETERMINATIONS.** Simultaneous changes of pH in the inner and outer liquids of proteoliposomes, the membrane of which consisted of asolectin and bacteriorhodopsin (BR), were determined during transient states after a shift from the light to the dark and the reverse. Some mathematical equations of a model characterizing the mechanism of the proton transport through the proteoliposome membrane were developed by considering the proton pump of BR, light-dependent and light-independent proton leaks from the liposomes, and buffering capacities of the intra- and extra-vesicular liquids. The model equations (equations 8(A) and 8(B)) could assess the effect of concurrent change of the bilateral proton concentrations on the rate of proton transport and could simulate well the dynamic aspect of pH changes within the internal and external liquid of the proteoliposomes. 22 refs.

**086797 PROTEINS AND CARBOHYDRATES AS ALTERNATIVE SURFACTANTS FOR THE PREPARATION OF STABLE MAGNETIC FLUIDS.** A one-stage preparation of table aqueous magnetic fluids is reported, whereby colloidal  $\text{Fe}_3\text{O}_4$  particles are dispersed using naturally occurring polymers and their derivatives (e.g. gelatine, polygalacturonic acid, carboxymethyl-cellulose and succinylated gelatine) as surfactant materials. Low-toxicity materials have been used to permit possible medical use of the fluids. Using a variety of surfactant concentrations at the time of particle formation, control of particle size has been achieved, and particles as small as 3.0 nm in diameter obtained. Stable fluids with up to 6%  $\text{Fe}_3\text{O}_4$  content can be produced, having magnetizations of 2  $\text{JT}^{-1}\text{Kg}^{-1}$  (20 Gauss). Fluids diluted 30-fold remain stable colloids. 13 refs.

**086798 EFFECT OF SUGARS ON  $\beta$ -LACTAMASE AGGREGATION IN ESCHERICHIA COLI.** Overproduction of the secreted protein  $\beta$ -lactamase was inhibited when non-metabolizable sugars, such as sucrose and raffinose, were added into the growth medium. A four-fold increase in the amount of soluble protein was obtained under optimal conditions. The mechanism for the inhibition of protein aggregation was investigated. Addition of 0.3M sucrose decreased the rate of processing of the  $\beta$ -lactamase precursor, causing its transient accumulation within the cell. (Author abstract). 16 Refs.

**086800 LIGHT- OR OXIDANT-INDUCED GENERATION OF FREE RADICALS IN HEMOPROTEINS.** Upon reactions with oxidants, hemoproteins retain their oxidizing equivalents not only in the heme iron, but also in the porphyrin or amino acid residues. HRP has a protein structure that stabilizes the porphyrin  $\pi$ -cation radical, which can easily be formed through various reactions. CCP reacts with  $\text{H}_2\text{O}_2$  to form free radicals in amino acid residues as a catalytic intermediate species, which is stable in the absence of added electron donor. Ferric myoglobin apparently behaves as CCP, but its amino acid free radicals are unstable. These properties seem to be reflected on photooxidation of these hemoproteins. (Author abstract). 27 Refs.

**086802 SYNTHESIS AND CHARACTERIZATION OF 2- $\mu\text{m}$  WIDE-PORE SILICA MICROSPHERES AS COLUMN PACKINGS FOR THE REVERSED-PHASE LIQUID CHROMATOGRAPHY OF PEPTIDES AND PROTEINS.** Silica microspheres have been prepared with wide (200 Å) pores for the high-speed separation of biomacromolecules. These 1-2- $\mu\text{m}$  particles are synthesized in a narrow particle-size distribution at relatively high yield by significantly modifying the coacervation reaction used to produce Zorbax (Du Pont) chromatography packings. Reversed-phase columns prepared from 2- $\mu\text{m}$  particles exhibited > 130,000 plates/m with good permeability and peak symmetry. Separations of the multicomponent peptide and protein mixtures were performed in less than a minute with good recoveries of such solutes. (Author abstract) 23 refs.

**086803 FAST AFFINITY CHROMATOGRAPHY USING SMALL PARTICLE SILICA-BASED PACKING MATERIALS.** Affinity chromatography is one of the most powerful techniques for the purification of biologically active proteins available. The ability of this method to purify proteins is based on highly specific, selective or characteristic interactions with immobilized ligands. The criteria for developing a general, derivatizable, high performance support for high performance affinity chromatography are discussed. The step-by-step examination of these criteria and experimental evidence for determining parameters such as ligand density, non-specific adsorption and column lifetime for such a system are described. Chromatographic results are shown

for preparative separations of (i) receptor proteins, (ii) antibodies and (iii) active enzymes. (Edited author abstract) 12 refs.

Hollis, Donald F. (Smith Kline & French Lab, Philadelphia, PA, USA); Ralston, Steven; Suen, Eric; Cooke, Nelson; Shorr, Robert G.L. *J Liq Chromatogr* v 10 n 11 1987 p 2349-2368.

**086804 HIGH-PERFORMANCE AQUEOUS SIZE-EXCLUSION CHROMATOGRAPHY USING DIOL-BONDED POROUS GLASS PACKING MATERIALS. RETENTION BEHAVIOR OF SOME PROTEINS.** This paper is concerned with the observation of the effects of the concentration, the type and pH of buffer solutions used as the mobile phase and the concentration of added neutral electrolytes on the retention volume. Elucidation of the various contributions from non-size-exclusion effects to the retention volume of proteins was attempted. It is shown that potassium thiocyanate showed a different action for retention of proteins compared to other neutral electrolytes and acted like sodium dodecyl sulphonate. (Edited author abstract) 8 refs.

**086805 DIRECT COMBINATION OF A HIGH PERFORMANCE LIQUID CHROMATOGRAPH AND A CIRCULAR DICHROISM SPECTROMETER FOR SEPARATION AND STRUCTURAL ANALYSIS OF PROTEINS.** Basic studies of the combined system of a high performance liquid chromatograph (HPLC) and a circular dichroism (CD) spectrometer for separation and analysis of proteins are described. The HPLC-CD measurement of standard protein mixture was easily carried out by using a micro flow-cell device with a beam condenser and with a thin cell of a 1 mm-optical path. The effluent was firstly monitored at 280 nm by using an UV detector and subsequently monitored at 220 nm by using a CD spectrometer. The CD spectrum at each chromatographic peak by CD was measured in the wavelength region of 250-195 nm by a stopped flow method. (Author abstract) 16 refs.

## Coagulation

**086807 CASEIN MICELLES: STRUCTURE, PROPERTIES AND ENZYMIC COAGULATION.** It is necessary to understand the effects of micelle size, chemical and physical structure and the electrostatic, hydrophobic and steric forces acting between micelles if realistic explanations of the coagulation process are to be developed. This paper reviews the developments in the literature that contribute to such an understanding. The literature suggests that prediction of coagulation should be possible once the forces that impact micelle coagulation

are understood. (Edited author abstract) 84 refs.

**086810 ANTHEPROT: A PACKAGE FOR PROTEIN SEQUENCE ANALYSIS USING A MICROCOMPUTER.** A simple microcomputer package is described to make the theoretical analysis of protein sequences. Several methods designed to compare two sequences, to model proteolytic reactions and to predict the secondary structure, the hydrophobic/hydrophilic regions and the potential antigenic sites of proteins have been included in an Apple II microcomputer software. The package comprises 21 programs as well as the secondary structure database of W. Kabsch and C. Sander. (Author abstract). 25 Refs.

Deleage, Gilbert (CNRS, Villeurbanne, Fr); Clerc, Francois F.; Roux, Bernard; Gautheron, Daniele C. *Comput Appl Biosci* v 4 n 3 Aug 1988 p 351-356.

**086811 SIMPLE METHOD FOR PREDICTING THE SECONDARY STRUCTURE OF GLOBULAR PROTEINS: IMPLICATIONS AND ACCURACY.** A method is presented for predicting the secondary structure of globular proteins from their amino acid sequence. It is based on a rigorous statistical exploitation of the well-known biological fact that the amino acid compositions of each secondary structure are different. Also proposed is an evaluation process that allows us to estimate the capacity of a method to predict the secondary structure of a new protein which does not have any homologous proteins whose structure is already known. This evaluation process shows that the method has a prediction accuracy of 58.7 percent over three states for the 62 proteins of the W. Kabsch and C. Sander (1983a) data bank. This result is better than that obtained by the most widely used methods. A simple Pascal implementation of the method prediction algorithm is given. (Edited author abstract). 23 Refs.

**086812 USE OF VARIOUS PROPERTIES OF AMINO ACIDS IN COLOR AND MONOCHROME DOT-MATRIX ANALYSES FOR PROTEIN HOMOLOGIES.** Software has been developed to allow the

use of a number of parameters in the comparative representation of proteins in color and monochrome dot matrices. The problem of scoring matched identities is addressed. The PAMs matrix has been incorporated in such a way to allow the user to stipulate various PAM's values or estimated percentage difference between two peptide sequences, and converting to log odds values. In addition, the similarity ring developed by R. Swanson and the matrix proposed by D.J. Bacon and W.F. Anderson have been adapted for use in the program. Color indices have been utilized to give a 'third dimension' to the projections, allowing the user to judge the degree of similarity of different regions which are represented. (Edited author abstract). 8 Refs.

**086813 SIGSEQX: A COMPUTER PROGRAM FOR PREDICTING SIGNAL SEQUENCE CLEAVAGE SITES.** In the Signal hypothesis a signal sequence is that sequence of a protein which initiates the export of a growing protein chain across a membrane. Subsequently the signal sequence is cleaved from the mature protein. There has been significant correlation of cleavage site with molecular structure. A computer program to predict the signal sequence cleavage site, based on the G. von Heijne's method, has been implemented in the C language. The program is run interactively with options specified in the program run command line or entered at program prompts for information. Typical processing times are in the order of a few tenths of a second of CPU time. 6 Refs.

## Condensation

**086815 NOVEL CONDENSATION SYSTEM FOR AQUEOUS SOLUTIONS OF PROTEINS. FACILITATED PERMEATION OF PROTEINS THROUGH A POROUS MEMBRANE PREPARED FROM A BLOCK COPOLYMER CONSISTING OF HYDROPHILIC POLYAMIDE AND POLYOXYETHYLENE SEGMENTS.** A new porous membrane was prepared from a block copolymer consisting of hydrophilic polyamide as outer segments and polyoxyethylene as an inner segment by casting a mixture of the block copolymer with polyoxyethylene glycol and drying it at room temperature, followed by immersion and rinsing in water. In the solute rejection test for some proteins, the concentration of the permeate was found to be much higher than that in the feed. This peculiar condensation was highly dependent not only on the casting conditions for the porous membrane, but also on the permeation conditions, such as the pressure difference, mechanical stirring, and the initial concentration of the protein solutions. The present transport system is presumed to result from a delicate combination of the rapid adsorption of proteins onto the porous membrane and their transport driven by the lower pressure. (Edited author abstract) 16 refs.

## Cooling

**086816 STABILIZATION OF LABILE BIOCHEMICALS BY UNDERCOOLING.** The problems relating to the stabilization of isolated biochemicals are discussed, with special emphasis on proteins. A novel process for the preparation of products with long shelf-lives is described. It relies on undercooling, as distinct from freezing, and does not require the use of protectant additives. Isolated proteins can be formulated to any desired concentration and can be stored in a freezer ( $-12$  or  $-20^{\circ}\text{C}$ ) for extended periods without loss of activity. (Author abstract) 26 refs.

## Degradation

**086817 BARLEY PROTEIN DEGRADATION: MECHANISM OF PROTEIN SOLUBILIZATION DURING BARLEY MASHING WITH NEUTRAL PROTEINASE.** Kinetics of protein solubilization during barley mashing with neutral proteinase were studied. By plotting the kinetics data in Foster-Niemann coordinates for barley concentration range of 10-30% linear relationships with high correlation coefficients ( $r \geq 0.999$ ) were obtained. The slopes of straight lines were very close to corresponding reciprocal initial insoluble nitrogen concentrations. Barley proteolytic inhibitors affected the ordinate intercept; by their addition the values of ordinate intercept decreased. The data suggest that the modified Foster-Niemann equation can be proposed to interpret kinetics of insoluble barley protein degradation. The proteolytic activity decay was studied as well. The enzyme decay was faster in buffer solution than during barley mashing, but in both cases first-order kinetics can be applied. A mathematical model describing protein solubilization and enzyme decay kinetics were developed. The results of computer simulation were in good agreement with experimental data. (Author abstract) 35 refs.

## Desorption

**086818 DESORPTION OF SPREAD MONOLAYERS OF  $[^{14}\text{C}]$  METHYLATED AND COLD BSA FROM THE AIR-AQUEOUS INTERFACE.** Compression-expansion cycles on spread monolayers of BSA (Bovine Serum Albumen) and  $[^{14}\text{C}]$  methylated BSA at the air/phosphate buffer interface at  $20^{\circ}\text{C}$  showed that irreversible losses in area occurred after films were held at surface pressure greater than  $18 \text{ mN m}^{-1}$ , although the compressibility was unchanged. The rates of desorption of BSA and of a 2:1 mixture with radiolabelled BSA were similar at  $\Pi = 21, 24$  and  $30 \text{ mN m}^{-1}$ , and increased with increasing surface pressure. The surface concentration of protein obtained after successive cycling, from the activity of the labelled monolayer transferred onto plates by the Langmuir-Blodgett technique, was constant within experimental error, indicating that area losses were caused by desorption. (Edited author abstract). 15 Refs.

## Differential Thermal Analysis

**086819 THERMOANALYTICAL INVESTIGATIONS OF EXTENDED AND ANNEALED KERATINS.** DSC (differential scanning calorimetry) investigations have been used to characterize the microfibril-matrix complex of wool and hair keratins consisting of helical low-sulfur microfibrils in a nonhelical high-sulfur matrix. The corresponding DSC curves display one or two endothermic peaks in the temperature range  $230^{\circ}$ - $255^{\circ}\text{C}$ . The first peak is a microfibrillar peak and the second one a matrix peak (cystine decomposition peak). DSC investigations of extended keratins have shown that the microfibrillar peak is a helix peak. DSC investigations of annealed keratins confirm an earlier assumption that the helix peak is an irreversible helix unfolding, superimposed by various decomposition reactions. The matrix peak is less reproducible than the corresponding helix peak and cannot be used for further characterization studies of keratins. (Author abstract) 11 refs.

## Extraction See Also WOOL—Cleaning.

**086822 PROTEIN EXTRACTIONS WITH HOLLOW FIBERS.** Differential protein extractions were measured with two types of extractants: inverted micelles and two-phase aqueous systems. The results show that hollow-fiber extractions are substantially faster than those possible in conventional equipment. The extractions are not compromised by loading or flooding because the flows of extractant and raffinate are almost completely independent. Mass transfer coefficients inferred from the measurements both support and extend design equations for these contactors. (Author abstract) 25 refs.

Dahuron, Lise (Univ of Minnesota, Minneapolis, MN, USA); Cussler, E.L. *AIChE J* v 34 n 1 Jan 1988 p 130-136.

**086823 EXTRACTION OF  $\beta$ -GALACTOSIDASE FUSED PROTEIN A IN AQUEOUS TWO-PHASE SYSTEMS.** A method for the purification of proteins hybridized with  $\beta$ -galactosidase and produced in *Escherichia coli* is suggested. The method is based on the dominating properties of the  $\beta$ -galactosidase part of the molecule that are utilized for extraction in a poly(ethylene glycol) 4000/potassium phosphate aqueous two-phase system. The purification of the hybrid protein *Staphylococcal* protein A-*Escherichia coli*- $\beta$ -galactosidase (SpA- $\beta$ gal) produced in *Escherichia coli* is described. The partitioning of the cell debris and SpA- $\beta$ gal depended on the distance to the critical point, i.e., the length of the tie line. A poly(ethylene glycol) top phase and an interface

free from cell debris were obtained for a composition close to the binodal with a relatively short tie line. At this composition no SpA- $\beta$ gal was caught by the interface. The partitioning of SpA- $\beta$ gal to the top phase was also affected by the salts present during the extraction. The utilization of SpA- $\beta$ gal for affinity extraction has been investigated. Experiments with SpA- $\beta$ gal and fluorescence-labeled human IgG(higG-F) in a poly(ethylene glycol) 4000/potassium phosphate aqueous two-phase system showed that the complex SpA- $\beta$ gal-higG-F was partitioned to the interface, probably as a precipitate. (Author abstract) 32 refs.

Veide, Andres (Royal Inst of Technology, Stockholm, Sweden); Strandberg, Lars; Enfors, Sven-Olof. *Enzyme Microb Technol* v 9 n 12 Dec 1987 p 730-738.

**086824 LIQUID-LIQUID EXTRACTION OF LOW MOLECULAR-WEIGHT PROTEINS BY SELECTIVE SOLUBILIZATION IN REVERSED MICELLES.** The effects of pH and salt concentration on the solubilization of ribonuclease-a, cytochrome-c and lysozyme in Aerosol OT/isooctane reversed micelle solutions have been studied to explore the potential for employing this solvent system in the large-scale recovery and concentration of proteins using liquid extraction. For pH values below the isoelectric point, pI, of the protein, solubilization was high, probably owing to strong electrostatic interactions between the positively charged proteins and the anionic surfactant heads forming the inner micelle wall. (Edited author abstract) 18 refs.

Goklen, Kent E. (MIT, Cambridge, MA, USA); Hatton, T. Alan. *Sep Sci Technol* v 22 n 2-3 Feb-Mar 1987, Fourth Symp on Sep Sci and Tec for Energy Appl, Knoxville, TN, USA, Oct 20-24 1985 p 831-841.

## Filtration See Also BIOLOGICAL MATERIALS—Blood.

**086825 POLARIZATION AND ADSORPTION EFFECTS ON SIEVING IN MEMBRANE PROTEIN FILTRATION.** The authors have developed a theoretic model to predict both the measured sieving coefficient and the ultrafiltrate flux in an unstirred batch filtration cell. Model predictions are in good agreement with experimental data, providing quantitative evidence for the effects of protein polarization on flux and sieving. In addition, results indicate that protein adsorption plays an important role in membrane filtration. The model for the unstirred cell permits very accurate evaluation of intrinsic membrane sieving coefficients for highly rejected proteins. These results are critical in the design and analysis of selective protein filtration devices, e.g., cascade filtration for separation of albumin from immunoglobulins. 10 refs.

Robertson, Bruce C. (Univ of Delaware, Newark, DE, USA); Zydney, Andrew L. *ASAIOTrans* v 33 n 3 Jul-Sep 1987 p 118-122.

**086826 MICROFILTRATION OF PROTEIN SOLUTIONS: EFFECT OF FOULING ON REJECTION.** In cross-flow microfiltration of proteins both flux and protein transmission decline over time as proteins adsorb onto the membrane. It was found that protein-membrane interaction is a consequence of charge effects in the double-layer of the membrane and the charged ion. Whey protein solutions of different pH in the presence of salt and without salt were filtered to investigate this interaction. Addition of 100 mM NaCl to water which has been pretreated by reverse osmosis increased the water flow. (Author abstract) 7 refs.

Heinemann, P. (Univ of Bath, Bath, Engl); Howell, J.A.; Bryant, R.A. *Desalination* v 68 n 2-3 Mar 1988, Proc of the 5th Symp on Synth Membr in Sci and Ind, Tuebingen, West Ger, Sep 2-5 1986 p 243-250.

## Fractionation

**086827 CONTINUOUS FRACTIONATION OF HUMAN PLASMA PROTEINS BY PRECIPITATION FROM THE SUSPENSION OF THE RECYCLING STREAM.** The conventional cold-ethanol batch fractionation method of human plasma is converted to an

automatically controlled continuous fractionation process. The selected protein fractions are precipitated by mixing in the recycled product stream of the suspension. Compared to the batch process, the continuous fractionation process generates less coprecipitation and less spontaneous nucleation, allowing efficient centrifugation of precipitates, and the yield and purity of albumin in the final fraction is significantly increased. (Author abstract) 12 refs.

**Hydrolysis** See Also ALGAE—Industrial Applications; AMINO ACIDS—Production.

**086828 SPECIFIC LIMITED HYDROLYSIS AND PHOSPHORYLATION OF FOOD PROTEINS FOR IMPROVEMENT OF FUNCTIONAL AND NUTRITIONAL PROPERTIES.** Limited specific hydrolysis of casein by *Staphylococcus aureus* V8 protease was used to produce 2% and 6.7% hydrolysates (2 and 6.7% of the peptide bonds hydrolyzed), each containing five polypeptides (by gel filtration) ranging in size from approximately 16,000 to approximately 1,000 daltons. The mixtures of polypeptides had substantially increased solubilities at pH 4.0-4.5, near the isoelectric point of casein. Phosphorylation of zein markedly increased the water solubility of zein above and below pH 4. All the modified zeins had improved emulsifying activity indices. (Edited author abstract) 50 refs.

Chobert, Jean-Marc (Univ of California, Davis, CA, USA); Sitohy, Mahmoud; Whitaker, John R. *JAOCs J Am Oil Chem Soc* v 64 n 12 Dec 1987 p 1704-1711.

**086829 ENZYME HYDROLYSIS OF PLASMA PROTEINS IN A CSTR ULTRAFILTRATION REACTOR: PERFORMANCES AND MODELING.** By investigating the effects of four operating variables - volume (V), ultrafiltration flux (J), enzyme concentration (E), and substrate concentration (S) - on capacity (K) and conversion rate ( $\epsilon$ ) of a hollow fiber CSTR, the performances of the CSTR and the kinetic constants of the reaction were determined. A model which takes into account the course of fractional conversion (X) according to the modified space-time parameter,  $\tau$  (integrated form of V, J, S, and E), was devised by employing the relationship to integrate the equation for the reaction rate of the CSTR and the expression of the modified space time. Correlation of this model and the experimentally obtained results demonstrates that the characteristics for an ultrafiltration membrane reactor for enzymatic hydrolysis by alcalase of plasma proteins are close to those of an ideal CSTR. Optimal scaling up, however, remains dependent on the compromise which may be obtained between capacity and the conversion rate. (Author abstract) 29 refs.

**086830 APPLICATION OF ULTRAFILTRATION TO THE PREPARATION OF DEFINED HYDROLYSATES OF BOVINE HAEMOGLOBIN.** Many uses of protein hydrolysates have been developed and applied to areas such as nutritional therapy, culture media, and the isolation of biologically active peptides. All these applications need carefully controlled and characterized hydrolysates. In order to produce such a type of hydrolysate, it is possible to use haemoglobin which is a very well defined and constant protein source. Enzymic hydrolysis of haemoglobin by pepsin was carried out at pilot-plant scale in an ultrafiltration reactor with mineral membranes. The object was to obtain a reproducible, decolorized, salt-free enzymic hydrolysate. Two types of membranes were tested having 10,000 dalton (M5 type) and 20,000 dalton (M4 type) cut-offs. Little significant difference was observed in the final products when both types of membranes were used. Reproducibility of hydrolysates was verified by amino acid analysis and gel filtration chromatography. The haemoglobin hydrolysates produced contained more than 90 percent protein and are especially

suitable for fine applications. (Author abstract) 14 Refs.

**Manufacture** See Also GENETIC ENGINEERING—Applications.

**086831 TOXICOLOGIC AND HYGIENIC APPRAISAL OF YEAST-LIKE FUNGI AS INDUSTRIAL PRODUCERS OF FODDER PROTEIN.** Yeast-like protein-producing fungi are nontoxic, have low toxicogenicity and weak virulence. Sensitizing activity of yeast-like fungi is a major factor contributing to their negative body effect. When introducing microorganisms as fodder protein producers into the manufacture process it is necessary to take account not only of their virulent but also allergic nature. Yeast strain for DA<sub>50</sub> less than 10<sup>3</sup> cells per animal under intracutaneous administration should not be allowed to be used in the manufacture process. Taking into account the obtained sensitizing characteristics the analyzed strains are attributed to the second risk class. Maximum allowable concentration of yeast-like fungi for the work zone air should be set at 460 cells per 1 m<sup>3</sup>. (Author abstract) 2 refs. In Russian.

**086832 EFFECT OF THE GLUCOSIDASE INHIBITOR 1-DEOXYNOJIRIMYCIN ON PROTEIN SECRETION FROM SACCHAROMYCES CEREVISIAE.** 1-Deoxynojirimycin (dNM), an inhibitor of the trimming enzymes glucosidase I and II, increased secretion of a cloned human peptide hormone, somatomedin C, about fourfold. The stimulation was reversible and directly dependent on dNM concentration. The effect was observed with cells grown in batch or with immobilized steady-state cultures. Most likely, dNM affected processing of N-linked glycans, since it reduced the catalytic activity of external yeast invertase even in low concentrations. This could be attributed to preventing the outer chain glycosylation of the surface exposed glycans. (Author abstract) 38 refs.

## Measurements

**086833 LOW COST NUCLEAR TECHNIQUE FOR THE RAPID DETERMINATION OF THE PROTEIN CONTENT OF RICE.** An attempt has been made to use the 10.82 MeV  $\gamma$  rays emitted in the prompt <sup>14</sup>N (n,  $\gamma$ ) reaction to investigate the feasibility of determining the content of nitrogen in bulk samples of rice using a <sup>252</sup>Cf source. Gamma ray spectra of samples of urea (H<sub>2</sub>NCONH<sub>2</sub>) irradiated with thermal neutrons from a <sup>252</sup>Cf source with a yield of  $3.0 \times 10^5$  neutrons/s clearly showed the full energy peak and escape peaks due to  $\gamma$ -rays from neutron capture in nitrogen. A  $3 \times 3$  in. NaI(Tl) crystal was used as the detector and the neutrons were thermalized in paraffin before their capture. The 10.82 MeV  $\gamma$ -rays from neutron irradiated rice have been detected using the weak neutron source. It appears that the method should be useful for rapid determination of the nitrogen content in rice if a stronger californium source were employed. This should enable a rapid determination of the protein content, as this is correlated with the amount of nitrogen in the rice. (Author abstract) 6 refs.

## Microstructure

**086834 NEW GRAPHIC REPRESENTATION OF STRUCTURAL PARAMETERS OF PROTEINS.** A computer program is described that is designed to make the visual inspection of classical plots of protein properties

(e.g. hydrophobicity, volume, etc.) as a function of sequence easier. An algorithm written in BASIC language has been used in order to generate a pseudo-tridimensional representation of the desired protein property. The data utilized by the program are arithmetic averages of the selected parameter obtained by using a five-residue window as a shuttle along the given amino acid sequence. (Author abstract) 7 refs.

**Modification** See Also WOOL FIBERS—Crimping.

**086835 CHEMICAL AND PHYSICAL LIPOPHILIZATION OF PROTEINS.** With a view to enhance the amphipathic nature of food proteins, chemical and physical modification were carried out. Soy glycinin and  $\alpha_{s1}$ -casein were lipophilized by chemically attaching naturally occurring fatty acids to them. The covalent attachment of fatty acyl residues to these proteins caused an increase in their emulsification activity. Soy proteins and the maize protein, zein, were associated with soy lecithin and phosphatidate, respectively, by sonication. The emulsification activity of phospholipid-protein complexes was greatly increased after they were treated with 50% ethanol or enzyme digestion. (Author abstract) 13 refs.

Kito, Makoto (Kyoto Univ, Uji, Jpn). *JAOCs J Am Oil Chem Soc* v 64 n 12 Dec 1987 p 1676-1681.

**086836 CHEMICAL INACTIVATION OF SOY-BEAN TRYPSIN INHIBITORS.** Sodium metabisulfite and glutaraldehyde were used alone and in combination to inactivate Kunitz trypsin inhibitor (TI) in model systems and TI in lyophilized alkaline soy meal extract. Reaction of glutaraldehyde (0.1 to 3.0%, based on total volume of the reaction mixture) with Kunitz TI (3 mg/ml buffer) at 25 C resulted in 60-75% reduction in activity. Treatment of soy meal extract containing 0.08 mg TI/mg at a concentration of 10 mg sample/ml buffer under similar reaction conditions reduced TI activity only 40%, however. A reaction temperature of 75 C had little additional effect on TI inactivation. (Edited author abstract) 29 refs.

**086837 COMPARATIVE NUTRITIONAL VALUE FOR AMINO ACIDS, OLIGOPEPTIDES AND SOY-BEAN PROTEIN.** It has been hypothesized that partial protein hydrolysates or oligopeptide mixtures are nutritionally superior to corresponding amino acid mixtures. With this consideration for a background, the authors developed a sophisticated technique of protease-catalyzed modification of soy protein to produce enzymatically modified proteins (EMP) having different levels of covalently attached methionine. Discussions stress the importance of applying such a technique to production of an oligopeptide rather than a free amino acid nitrogen source as a foodstuff for therapeutic use. (Edited author abstract) 25 refs.

Arai, Soichi (Univ of Tokyo, Tokyo, Jpn); Kimura, Hiroko. *JAOCs J Am Oil Chem Soc* v 64 n 12 Dec 1987 p 1692-1696.

**086838 EFFECTS OF LIMITED PROTEOLYSIS ON FUNCTIONAL PROPERTIES OF OVALBUMIN.** The authors examined the limited proteolysis of ovalbumin by pepsin and its effect on the functional properties of the ovalbumin. Pepsin hydrolyzed only the single peptide bond of ovalbumin between His-22 and Ala-23. This provided a large intermediate (MW 42,500), P-ovalbumin. A P-ovalbumin solution gave a transparent gel when heated. Under the same conditions, an ovalbumin solution gave a turbid gel. The authors studied the

physicochemical properties of P-ovalbumin and the formation of the transparent gel. (Edited author abstract) 14 refs.

**086839 FUNCTIONAL PROPERTIES OF CHEMICALLY MODIFIED EGG WHITE PROTEINS.** Functional properties of egg white proteins can be altered through selected chemical reactions. Acylations with acid anhydrides have received the greatest amount of attention. Oleic acid and sodium dodecyl sulfate (SDS) have also been used to affect function of egg white proteins. The altered ionic properties have been shown to affect the optical properties of protein sols, heat stability, foaming, performance in angel cakes, initiation of gelation, ultimate strength and freeze-thaw stability of heat-set gels. (Edited author abstract) 33 refs.

Ball, Hershell R. Jr. (North Carolina State Univ, Raleigh, NC, USA). *JAOCs J Am Oil Chem Soc* v 64 n 12 Dec 1987 p 1718-1725.

**086840 FUNCTIONAL PROPERTIES OF OAT PROTEINS MODIFIED BY ACYLATION, TRYPSIN HYDROLYSIS OR LINOLEATE TREATMENT.** Proteins extracted from defatted oats were chemically modified by acylation (succinylation and acetylation), potassium linoleate treatment or partial hydrolysis with trypsin. Total essential amino acid content was slightly lowered by acetylation, but unaffected by succinylation. Gel filtration chromatography showed some dissociation of oat polypeptides by succinylation, while trypsin hydrolysis caused considerable breakdown of the protein. When compared to the unmodified oat protein, succinylation led to an improvement in performance in an emulsified meat system. (Edited author abstract) 17 refs.

**086841 MODIFICATION OF ARACHIN - EFFECT OF CITRATE IONS - STRUCTURAL IMPLICATIONS.** The effect of the anion citrate on the subunit structure of arachin has been monitored by velocity sedimentation, viscosity and circular dichroism techniques. The results indicate that as the concentration of citrate ion increases from 25 mM to 150 mM, arachin dissociates progressively to the low molecular weight 2S component. This dissociation is not accompanied by any conformational changes or denaturation as revealed by the far ultraviolet circular dichroic spectra and viscosity results, respectively. The results are explained by direct anion binding and changes in the solvent structure. (Author abstract) 17 refs.

Prakash, V. (Central Food Technological Research Inst, Mysore, India); Appu Rao, A.G.; Rajagopal Rao, D. *JAOCs J Am Oil Chem Soc* v 64 n 12 Dec 1987 p 1732-1735.

**086842 GENETIC MODIFICATION OF FOOD PROTEINS.** Directed alterations in the genome of food-producing organisms by deletion or addition of selected nucleic acid bases can lead to changes in the primary sequences of individual food proteins. Resulting modifications in the physico-chemical properties or enzymatic susceptibility of the altered gene product are superimposed on the endogenous normal proteins. If sufficient quantities of the novel protein are synthesized and become admixed with the basal levels of protein in the food, the functional properties of the food system (emulsification, foaming, gelling, etc.) may become enhanced. Alternatively, the modified protein might be isolated for use separately as a food ingredient. Thus genetic engineering techniques may provide the basis for production of higher quality and novel food products. (Author abstract) 19 refs.

## Molecular Structure

**086843 STRUCTURE OF CASEIN MICELLES II.  $\alpha_{s1}$ -CASEIN.** Static and dynamic light scattering measurements were performed in a concentration range from 0.5 to 6.0 mg/ml at  $T=35^\circ\text{C}$ . A constant apparent molecular weight of  $3.4 \times 10^6$  daltons was found over the whole range. The apparent radii of gyration and the diffusion coefficients also show no detectable concentration dependence. The ratio of the two radii  $\rho \equiv R_g/R_H = 2.78 \pm 0.21$  is characteristic of extended rigid structures.  $R_g$  is the radius of gyration and  $R_H$  the hydrodynamic radius extended via the Stokes-Einstein relationship from the translational diffusion coefficient. This is in agreement with the analysis of the pronounced angular dependence of the scattered light, which leads to the conclusion that  $\alpha_{s1}$ -casein forms very long worm-like micelles. The contour length of one cylinder was found to be  $L \approx 1600$  nm and the chains appear to be composed of about 12 Kuhn segments. (Edited author abstract) 9 refs.

**086844 PROTEIN STRUCTURE DETERMINATION BY NMR.** For soluble proteins below about 10 kDa, nuclear magnetic resonance (NMR) now offers a route to obtaining a 3-D structure. The method is illustrated with work on human epidermal growth factor. The significance for biotechnology is that for the first time there is now an alternative to X-ray crystallography. Once a structure is solved by NMR methods, a relatively rapid examination of minor variants produced by recombinant DNA methods then becomes possible. (Author abstract) 26 refs.

## Physical Properties

**086846 INTERFACIAL INTERACTIONS BETWEEN PROTEINS AND MAMMALIAN LIPASES.** The effects of proteins, both endogenous and exogenous, on the activity of lipases against water soluble and water insoluble substrates have been reviewed. The enzymes considered are pancreatic and gastric lipases, and lipoprotein, bile-salt-stimulated human milk and pancreatic carboxyl ester lipases. This discussion gives consideration to association of the proteins with the enzyme or the interface and to whether the interactions with specific binding sites or interfacial inactivation are responsible for the observations. However, the effect of proteins on lipases acting against water soluble substrates varies from protein to protein. (Edited author abstract) 131 refs.

**Precipitation** See Also DRUG PRODUCTS—Chromatographic Analysis.

**086847 POLYMER DOSAGE CONSIDERATIONS IN POLYELECTROLYTE PRECIPITATION OF PROTEIN.** The properties of aggregates formed by the precipitation of egg white proteins by carboxymethyl cellulose (CMC) were examined. Both the final level and the number of incremental additions of the polyelectrolyte were varied. The protein and lysozyme recoveries, particle zeta potential, and protein composition of the precipitate were found to vary with only the final CMC level. Particle size and size distributions were dependent on both the polymer dosage and manner of addition. Overdosed systems, or systems in which the CMC dosage exceeded that required for optimal total protein removal, produced the smallest particles, with size increasing as the number of incremental polymer additions increased. Optimally dosed systems produced the largest particles. (Author abstract) 31 refs.

Clark, K.M. (Iowa State Univ, Ames, IA, USA); Glatz, C.E. *Biotechnol Prog* v 3 n 4 Dec 1987 p 241-247.

**086848 PROTEIN PRECIPITATE RECOVERY USING MICROPOROUS MEMBRANES.** The use of microporous membranes has been examined for the recovery of precipitated protein suspensions and related soluble protein. Membrane flux rates and soluble protein transmissions are reported for unstirred batch-cell studies and cross-flow experiments. The unstirred batch-cell gave soluble protein transmissions in the range 80-100% for feeds containing either soluble protein or a mix of soluble and isoelectrically precipitated protein. In all cases a sharp decline in flux was observed which was, for example, considerably greater for soluble protein at its isoelectric point, pH 4.6, than at pH 8.8. The presence of precipitated protein led to a further decrease in flux rate. In cross-flow studies, flux decline was eventually accompanied by a significant decline in soluble protein transmission. The flux protein-transmission characteristics of microporous membranes are discussed in terms of the interaction of the soluble and precipitated protein with the membrane. (Author abstract) 22 refs.

**086850 PRODUCTION OF PROTEIN BY THERMOPHILIC FUNGI FROM SUGAR-BEET PULP IN SOLID-STATE FERMENTATION.** Conversion of lignocellulosic plant materials into protein by microorganisms is a process of increasing importance for the future. The organic biomass produced by photosynthesis is estimated at  $163 \times 10^9$  tons annually, and over half of this is in the form of cellulose and hemicelluloses. Management of these raw materials is difficult, however, because of the seasonal variation in plant vegetation and its territorial dispersion. For these reasons, waste materials from agriculture and forestry are attractive, such as cereal

straw, bagasse, sugar-beet pulp, residual plant materials, and wastepaper. Sugar-beet pulp was chosen as a cellulosic substrate as its physicochemical structure was considered suitable for the SSF process. The widespread production of sugar beets in some countries and the current high level of stock in the sugar industry suggest the possibility of real industrial applications. 5 refs.

**086853 PURIFICATION OF PROTEINS BY AQUEOUS TWO-PHASE PARTITION IN NOVEL ACRYLIC CO-POLYMER SYSTEM.** Polyampholytic acrylic co-polymers have been shown to form two-phase systems with polyvinyl alcohol under appropriate conditions of pH, ionic strength and temperature. These novel systems have been used for the purification of a number of proteins from crude extracts. The partition behavior of proteins appeared to be influenced predominantly by electrostatic interactions and could be manipulated by including electrolytes in the systems. Human serum albumin could be purified to apparent homogeneity (2.2-fold) in a single extraction step from plasma while partial purifications of trypsin (3.4-fold) and carboxypeptidase G2 (3.5-fold) were also obtained. In contrast to conventional PEG/dextran two-phase systems, quantitative protein recovery from liquid phases containing polyampholytes could be achieved simply by iso-electric precipitation of the polymer. (Author abstract) 19 refs.

Hughes, Peter (Univ of Cambridge, Cambridge, Engl); Lowe, Christopher R. *Enzyme Microb Technol* v 10 n 2 Feb 1988 p 115-122.

**086854 REMOVAL OF NUCLEIC ACID CONTAMINANTS USING NUCLEASE ENZYMES DURING PROTEIN ISOLATION.** An immunogenic subunit of the Plasmodium falciparum circumsporozoite protein confers immunity against the sporozoite stage of malaria. This antigen has a molecular weight (MW) of 17,254 and is composed of 163 amino acids, including 32 randomly repeated tetrapeptides fused to a 32 amino acid sequence derived from the tetracycline resistance region (tet32) of pBR322. The tet32 gene fragment is read out of frame, yielding an amino acid sequence containing 12 arginines and 6 histidines at the C-terminus. This highly cationic tet32 tail results in a theoretical pI for the antigen of 12.8. Conventional isolation techniques initially failed to yield a product substantially free from nucleic acids. This communication presents evidence for the formation of a nucleic-acid-antigen complex to account for the copurification of these two species during isolation and describes

a process to degrade this complex enzymatically using commercially available phosphodiesterases. 9 refs.

Zabriskie, D.W. (Smith Kline & French Lab, Swedeland, PA, USA); DiPaolo, M. *Biotechnol Bioeng* v 32 n 1 Jun 1988 p 100-104.

**086855 LARGE-SCALE ELECTROPHORESIS FOR PROTEIN PURIFICATION: EXPLOITING ISOELECTRICITY.** Preparative electrophoresis methods (including isoelectric focusing in immobilized pH gradients) in gel phases are characterized by low loading (barely a few mg protein per ml matrix), low recoveries (rarely exceeding 70%), and heavy contamination from neurotoxic gel materials (the unreacted gel monomers and ungrafted oligomers). These drawbacks can be minimized by a version of isoelectric focusing in which the need for protein of interest to pass the gel is eliminated: only the contaminants traverse the gel. This is achieved by circulating a liquid sample between two gels held at controlled pHs. The method can provide: (1) high rate of sample processing (up to 1 g h<sup>-1</sup>); (2) high purification (in general to charge homogeneity) and (3) high recoveries (>95%). A large-scale membrane apparatus has been built, with a cross-sectional diameter of 9 cm. Large Pt electrode disks provide even current flow. In this electrolyser, 10 g of Eglin C (produced by recombinant DNA technology) have been purified to homogeneity in around 10 h from 1 l of a partially enriched preparation. (Author abstract) 18 refs.

Righetti, Pier Giorgio (Univ of Milan, Milan, Italy); Barzaghi, Barbara; Faupel, Michel. *Trends Biotechnol* v 6 n 6 Jun 1988 p 121-125.

**086856 DUAL-FUNCTIONAL AFFINITY PROTEIN PURIFICATION.** A rapid, single stage purification scheme for the enzyme pyruvate kinase (PK), overproduced by a genetically altered strain of *Saccharomyces cerevisiae*, is presented. A single affinity adsorption, washing and elution stage using a novel dual-functional polyacrylamide affinity gel produces 60 percent recovery of PK and purification to near homogeneity within a few hours. A second elution step increases the recovery to 77 percent, but does not enhance purification. The novel dual-functional polyacrylamide affinity gel is a crosslinked matrix containing both Cibacron Blue F3G-A and carboxylic acid groups, resulting in a higher fraction of accessible Cibacron Blue F3G-A groups than Blue Sepharose CL-6B. The significant purification achieved in a single stage is due in part to the large initial PK concentration in the recombinant yeast. However, the unique dual-functional interaction between PK and the support surface greatly facilitates the one-step purification. PK interacts with the pseudo-affinity ligand, Cibacron Blue F3G-A, as well as the carboxylic acid groups on the gel support. This dual functional binding increases the strength of the PK-gel binding and the selectivity for PK when binding is carried out below the pI of PK. Elution is accomplished under mild conditions, by raising the pH above the isoelectric pH of PK, making the interaction between PK and the carboxylic acid groups repulsive.

**086860 DEOXYMYOGLOBIN MODEL WITH A STERICALLY UNHINDERED AXIAL IMIDAZOLE.** With use of an  $\alpha, \alpha, \alpha, \alpha$ -tetra-*o*-amido functionalized tetraphenylporphyrin having trans-dipivalamido pickets and a trans-NH-C(O)-(CH<sub>2</sub>)<sub>6</sub>-C(O)-NH- strap, a single-face hindered porphyrin is produced. Its iron(II) complex attains only five-coordination with the unhindered axial ligand 1-methylimidazole. The product has been isolated as a toluene solvate and characterized by magnetic susceptibility. Mossbauer spectroscopy and single-crystal X-ray structure analysis as a five-coordinate high-spin iron(II) complex. The structure is compared to other five-coordinate imidazole-ligated metalloporphyrin species reported in the literature. Of greatest interest is the comparison with previously characterized five-coordinate 2-methylimidazole-ligated iron(II) complexes where the 2-methyl substituent on imidazole is the means used to attain five-coordination. (Edited author abstract) 57 refs.

**086863 RESEARCH REPORT ON PROTEINS IN REVERSE MICELLES. STRUCTURAL ASPECTS AND ENZYMOLOGY.** In this research report we present various aspects of our basic investigations on proteins solubilized in AOT reverse micelles. In a first section, we present data on the rate of formation of water pool of reverse micelles: the time course of water solubilization is biphasic and it is often accelerated by the presence of proteins. In another section, kinetic studies of trypsin in reverse micelles are presented with the aim of a comparison with  $\alpha$ -chymotrypsin. In contrast to the latter protease, trypsin solubilized in AOT/isooctane did not show 'superactivity' at the pH optimum of the reaction. Finally, preliminary solubilization studies with lecithin as the surfactant in organic solvents are presented. (Edited author abstract) 44 refs.

## Rheology

**086864 THERMOTROPIC GELATION OF OVALBUMIN 1. VISCOELASTIC PROPERTIES OF GELS AS A FUNCTION OF HEATING CONDITIONS AND PROTEIN CONCENTRATION AT VARIOUS pH VALUES.** The present paper deals with the influence of pH on formation and viscoelastic properties of ovalbumin thermotropic gels. By a systematic approach, using the shear modulus as indicator of the degree of conversion during gelation, optimal gelation conditions were determined, i.e. temperature and heating time, for each pH value. Relaxation properties of thermotropic gels at various pH, obtained under optimal conditions, have also been compared. 20 refs.

**086865 SORPTION PROPERTIES OF A COMPOSITE SORBENT BASED ON AN ALUMINOSILICATE MATRIX.** The purpose of this work is to study the acid-base and sorption characteristics of KAS-1M sorbent. Serum albumin and proteins from milk serum were used as sorbates. The sorption characteristics of vermiculite itself with respect to the same protein macromolecules were studied for comparison. The results of potentiometric titration of KAS-1M sorbent without preliminary acid treatment, and of vermiculite, which is the aluminosilicate matrix for production of the carbonized sorbent, are given. By using solutions of serum albumin,  $\alpha$ -lactalbumin, and  $\beta$ -lactoglobulin, it is possible to study the sorption

relationships of proteins differing in molecular weight on KAS-1M sorbent. The results of this work show that carbonization of an organic component in the aluminosilicate structure is a significant factor for increasing the sorption capacity and raising the selectivity of native materials for protein macromolecules. 13 refs.

**086866 ISOLATION OF PROTEINS FROM WHEY WITH A NEW STRONGLY ACIDIC SILICA-BASED ION EXCHANGER.** A new type of strongly acidic ion exchanger based on macroporous silica coated with a thin layer of hydrophilic copolymer with sulphonic acid groups has been evaluated. The coating is crosslinked and covalently linked to the silica surface via diol groups. The performance for isolation of proteins from whey of the new ion exchanger and Spherosil S were compared using both batchwise adsorption and column operations with reconstituted whey. Higher breakthrough capacities were observed for the new ion exchanger than for Spherosil S. Excellent column operational lifetimes were found for the new product. (Edited author abstract) 17 refs.

**086867 PARAMETRIC EVALUATION OF FLUX DECLINE DURING ULTRAFILTRATION OF PROTEIN SOLUTIONS.** The authors investigated the application of ultrafiltration for the concentration and separation of protein solutions. Flux decline, varying both initial fluid properties and operating conditions, was experimentally studied using cellulose acetate hollow fiber modules. In addition, some methods for reducing flux decline, including backwash, backflush and chemical cleaning have been tested. Results indicate that flux decline is mainly due to macrolutes from the feed. However, moderate ultrafiltration pressure may lead to a slow flux decline in spite of low initial permeation rates. The use of chemical cleaning agents, especially sodium hypochlorite, proved to be highly effective in increasing the permeation rate to almost initial levels. Process design and scaling-up conditions are discussed. (Edited author abstract) 10 refs.

**086868 CORRELATION OF AQUEOUS TWO-PHASE PARTITIONING OF PROTEINS WITH CHANGES IN FREE VOLUME.** Phase separation and protein partitioning in polymer-salt aqueous two-phase systems have been correlated with changes in free volume. Both solute partitioning and phase stability are proposed to be related to those changes in liquid structure that can be described by measurements of the free volume of the mixture upon phase splitting. (Author abstract) 18 refs.

**086869 RESTRICTED DIFFUSION EFFECT ON THE BINDING OF PROTEINS TO POROUS POLYMER RESINS AS STUDIED BY REPETITIVE INJECTION METHOD.** A solution of bovine serum albumin (BSA) is repeatedly injected into a column packed with highly porous and hydrophobic polymer resins at appropriate intervals. The injected BSA is thoroughly retained in the column for 10 injections and, afterwards, starts to be eluted from the column gradually. Taking into consideration the restricting effect of already bound BSA upon the diffusion of newly injected BSA into the pores of the polymer resins, we can interpret the BSA elution profile from columns packed with polymer resin of various pore sizes and porosities. The effects of the binding rate constant and BSA concentration upon the elution profiles of BSA are also analyzed. Formyl groups are introduced into the polymers as a binding site with proteins, and the elution profiles of BSA from the column

packed with the formylated resin are also analyzed. (Author abstract) 19 refs.

**086871 LEAKAGE STABILITY OF LIGAND-SUPPORT CONJUGATES UNDER OPERATIONAL CONDITIONS.** Leakage of ligands bound either monovalently or polyvalently to Eupergit C and macroporous glass was followed spectrophotometrically in a recirculation reactor up to 2 months under continuous operation. The data revealed a very stable fraction of bound protein desorbing only slowly from saturable noncovalent binding sites. Once this fraction was removed (which takes at least 3 days of continuous washing) conjugates with practically unlimited leakage stability were obtained. (Author abstract) 10 refs.

**086872 CONTINUOUS SEPARATION OF PROTEIN FROM COLLOIDAL SOLUTION CONTAINING SEVERAL KINDS OF PROTEINS WITH ISOELECTRIC FOCUSING.** The continuous separation of each protein from a colloidal solution containing several kinds of proteins was investigated by isoelectric focusing. A separation device comprising three separation cells divided by semipermeable Teflon membranes and two electrode compartments was used in this experiment. A colloidal solution containing bovine serum albumin and bovine hemoglobins was used as a sample and ampholytes were used as a buffer reagent. The costly ampholytes were recovered from effluent by ultrafiltration for reuse as buffer solution. The equation for separation efficiency was analyzed semi-theoretically and the adaptability of the equation was examined experimentally. A separation efficiency of over 95 percent was obtained. (Author abstract). 6 Refs.

**086873 LIQUID-LIQUID EXTRACTION FOR PROTEIN SEPARATIONS.** The liquid-liquid extraction of proteins directly from fermentation media or cell homogenates is an attractive primary purification process and can be used both to remove cell debris and to provide some initial purification and concentration of the desired products. Suitable solvents for this extraction process are the two-phase polymer systems and reversed micellar organic phases, both of which offer moderate to high selectivities and capacities for the proteins to be recovered. Protein partitioning to the extractants can be controlled in a number of ways, including the changing of pH conditions, varying the ionic strength and salt type, and changing polymer or surfactant concentrations. Affinity partitioning has also been found to be effective in enhancing the selectivity of the extraction for specific proteins. 38 refs.

**086874 ANALYTICAL AND PROCESS CHROMATOGRAPHY IN PHARMACEUTICAL PROTEIN PRODUCTION.** Liquid chromatography can be used to separate proteins in the production of drug products. Some of the topics discussed include the protein structure of recombinant DNA-derived plasminogen activator; purification techniques; and product quality control. 7 refs.

Builder, Stuart E. (Genentech Inc, South San Francisco, CA, USA); Hancock, William S. *Chem Eng Prog* v 84 n 8 Aug 1988 p 42-46.

**086875 SEPARATION OF PROTEIN MIXTURES BY BIORAN POROUS GLASS MEMBRANES.** Glass as a membrane material has interesting features which contrast with the properties of the polymers employed conventionally, for example its rigid structure and its resistivity to aggressive media. Such membranes have been developed in the form of capillaries for the ultrafiltration of protein solutions. Possible applications include membrane plasmapheresis for medical purposes and fractionation in downstream processing of fermentation reactors. The physical, chemical and mechanical properties of glass membranes, and demonstration of their use in separation experiments of protein mixtures are described. Cut-off behaviour, influence of various process parameters and fouling problems as well as cleaning procedures and steam sterilization treatment is discussed. (Edited author abstract) 5 refs.

**086876 REDUCTION OF PHYTIC ACID CONCENTRATION IN PROTEIN ISOLATES BY ACYLATION TECHNIQUES.** The interaction of phytic acid (PA) with proteins is dependent on the charges and conformation of the proteins and the ionic strength of the solution. Hence, changes in these parameters brought about by acylation could change the extractability, precipitation and interactions of PA with protein and minerals and consequently the PA concentration of protein isolates from phytate-containing foods. This paper summarizes studies in rapeseed and navy bean flours which demonstrate that a high degree of succinylation or acetylation can be used to separate the proteins from the PA and to prepare low phytate protein isolates of good functional properties. (Edited author abstract) 27 refs.

**086878 NATURE OF THE LAYERS ADJACENT TO THE SURFACE OF A BALL OF FAT AND THE CHANGES IN THEM DURING ITS MOTION.** As a ball of fat moves, a cone containing layers forms in front of it. The formation of the layers occurs as a result of a redistribution of the components of the solution (proteins, phospholipids) close to the surface of the fat ball. It is

proposed that the redistribution is due to the oscillation generated by the surface of the fat ball as the liquid impinges against its surface. (Author abstract) 13 refs.

**086879 SURFACE PRESSURE, SURFACE POTENTIAL AND ELLIPSOMETRIC STUDY OF CYTOCHROME C BINDING TO DIOLEOYLPHOSPHATIDYLCHOLINE MONOLAYER AT THE AIR-WATER INTERFACE.** The binding of soluble cytochrome c to an insoluble monolayer of dioleoylphosphatidylcholine was studied. Surface pressure, surface potential and ellipsometric isotherms show that (i) cytochrome c is not adsorbed on a phosphatidylcholine monolayer compressed at 20 mN m<sup>-1</sup>, (ii) gradual incorporation of cytochrome c takes place as surface pressure decreases, and (iii) on recompression, the adsorbed protein is desorbed from the monolayer. In order to determine if the results can be explained by intrinsic interfacial properties of phosphatidylcholine and cytochrome c taken separately, we measured surface pressure, surface potential and ellipsometric-area isotherms of pure cytochrome c which had been (i) deposited from crystals, (ii) deposited from ethanol:H<sub>2</sub>O solution (2:1, v/v), and (iii) adsorbed at the air-water interface after injection into the subphase. (Edited author abstract) 25 refs.

**086880 MYOTOXIN  $\alpha$ -PHOSPHOLIPID INTERACTIONS, AN ATTEMPT BY INTRINSIC FLUORESCENCE TO DEFINE A POSSIBLE MODE OF ACTION FOR THE TOXIN ON MEMBRANES.** Intrinsic fluorescence of myotoxin  $\alpha$  from *Crotalus viridis* viridis has been proved to be due to tryptophan residues, and this knowledge allows one to detect, for the first time, an interaction of the toxin with phospholipids. The formation of lipid-protein species is followed by a blue shift of about 8 nm and a quenching of up to 50% of the emission of tryptophans. These changes could result from the positioning of Trp 32,34 residues at the lipid interface and/or a local conformational change of the toxin. In the  $\mu$ M range, complexes are formed only with charged lipids; charge complementarity of two partners is needed regardless of the physical state of the lipids. (Edited author abstract) 34 refs.

**086882 SPECTROSCOPIC QUANTITATIVE ANALYSIS OF STRONGLY INTERACTING SYSTEMS: HUMAN PLASMA PROTEIN MIXTURES.** Blood plasma protein infrared spectra, while qualitatively similar, display differences in the frequencies and intensities of absorption bands. These differences are sufficient to permit an accurate quantitative analysis of mixtures of

these proteins. The authors examine the performance of some alternative methods of spectroscopic quantitative analysis in determining the concentrations of proteins in aqueous solutions. The widely-used K matrix method, using sloping baselines and intercept functions, was found to be inadequate for these determinations. In contrast, a method based on the Q matrix approach, augmented by a robust equation solver, yielded results with a sufficient degree of accuracy to make it a viable tool for use in the study of proteins at solid interfaces and for more general applications in the field of protein chemistry. (Edited author abstract) 14 refs.

**086883 MASS SPECTROMETRY OF NATURAL AND RECOMBINANT PROTEINS AND GLYCOPROTEINS.** Most modern protein sequence analysis is carried out using classical, wet-chemical Edman degradation technology. However, an increasing number of studies on both natural and recombinant genetically engineered proteins demands the use of new technologies capable of assigning structural features such as glycosylation, which cannot be assigned by Edman sequence analysis. The most important alternative and complementary procedure at present is the use of high-mass mass spectrometry. This brief article introduces some of the principles and applications of the technique. Protein research laboratories, both academic and industrial, will make increasing use of these techniques to complement classical gas phase sequencing, and to identify post-translational modifications including glycosylation, phosphorylation, S-S bridge assignment and processing events, including the formation of 'ragged ends'. (Author abstract) 34 refs.

**086884 NMR OF SILK FIBROIN. 9. SEQUENCE AND CONFORMATION ANALYSIS OF THE SILK FIBROINS FROM BOMBYX MOTI AND PHILOSAMIA CYNTHIA RICINI BY <sup>15</sup>N NMR SPECTROSCOPY.** <sup>15</sup>N NMR spectra of the silk fibroin proteins from Bombyx mori and Philosamia cynthia ricini are reported. The silk fibroins were labeled biosynthetically with [<sup>15</sup>N]glycine or [<sup>15</sup>N]alanine. In the glycine resonance region, there are roughly three peaks for B. mori silk fibroin and four peaks for P. c. ricini silk fibroin. These peak splittings reflect the amino acid sequences in the main chain. There are two peaks in the alanine resonance region of the P. c. ricini silk fibroin spectrum. The higher field peak is assigned to the sequence of only alanine residues, where fast interconversion between  $\alpha$ -helix and random coil forms occurs, and the lower field peak to the random coil form. (Edited author abstract) 21 refs.

**086885 FOURIER DECONVOLUTION OF THE AMIDE I RAMAN BAND OF PROTEINS AS RELATED TO CONFORMATION.** Fourier deconvolution has been employed to enhance the resolution of the amide I Raman band of nine proteins found in milk and/or other foods. The broad band was resolved into several components. The overall shape of the amide I Raman band of proteins was found to be nearly Gaussian or to be composed of components. A Gaussian function was therefore used for deconvolution. The results obtained were more detailed than those obtained with the Lorentzian approximation usually employed. The resolved band components were assigned to specific conformations. The frequencies and assignments are in good agreement with previous Raman work based on entirely different procedures. The band areas of the resolved components appear to reflect the fraction of any given conformation in a protein. Semiquantitative estimations of protein confor-

mation are in reasonable agreement with data obtained by x-ray diffraction and by infrared methods. (Author abstract). 22 Refs.

**086887 VIBRATIONAL ENERGY RELAXATION PROCESSES IN HEME PROTEINS.** Vibrational energy relaxation pathways from optically excited heme proteins are studied using a transient thermal phase grating technique which monitors the solvent lattice temperature. Vibrational energy transfer from the porphyrin ring to the protein backbone leads to extensive delocalization of the energy in the protein helix which is efficiently transferred to the water interface in less than 20 psec. A slower relaxation process on the nanosecond time scale is also observed. The slow relaxation component is attributed to slow conformational relaxation processes of high potential energy states of the heme proteins accessed during the high internal energy conditions of the optically excited molecule. (Author abstract) 2 refs.

## Stability

**086891 STABILITIES OF LANTHANIDE-PROTEIN COMPLEXES.** After incubation of both serum and HSA solutions with radioactive lanthanide complexes the binding constants of the corresponding lanthanide-protein complexes formed in the protein solutions under physiologic conditions, pH: 7.4, temperature: 310 K, isotonic ionic strength: 0.15 mol/L, were determined. The association constants of the lanthanide-protein complexes formed both in serum and HSA-solutions are equal within the experimental error. In conclusion, serum albumin binding predominates for the radiolanthanides. With the decrease of the ionic radii from 1.034 Å (Ce) to 0.858 Å (Yb) the association constants increased by five orders of magnitude from  $\lg K_{pr} = 4.90$  (Ce) to  $\lg K_{pr} = 9.54$  (Yb). Further, a serum fractionation with alcohol was carried out to prove that the albumin fraction of serum is responsible for the lanthanide binding in blood. (Author abstract) 12 refs.

## Structure See Also GENETIC ENGINEERING.

**086892 PROTEUS: A SUITE OF PROGRAMS FOR PREDICTION OF STRUCTURAL FEATURES OF PROTEINS USING AN APPLE IIe.** We have implemented several algorithms, developed by various authors for predicting structural features of proteins from their primary structure, on an Apple IIe and collected them in a suite, named PROTEUS. This suite incorporates: (i) methods for predicting secondary structure; (ii) the algorithm for computing the hydropathy profile using one out of five available sets of parameters; (iii) the algorithms for calculating the hydrophobic moment plot; and (iv) for performing the amphipathic analysis using one out of four available sets of parameters. The suite has a utility program for storing on a disk the sequence to be analyzed. As an example, we applied some of the methods included in PROTEUS to predict the structure of a mitochondrial leader peptide. The results suggest the occurrence of structural features possibly related to the import of proteins into mitochondria. (Author abstract) 24 refs.

Pascarella, Stefano (Univ La Sapienza, Rome, Italy); Bossa, Francesco. *Comput Appl Biosci* v 3 n 4 Nov 1987 p 325-331.

**086893 PROTEIN ENGINEERING.** The techniques of protein engineering are proving to be a revolutionary experimental tool for understanding protein structure-function relationships. Even at this early stage, proteins of improved characteristics for specific industrial and therapeutic uses have already been produced. Tailoring enzymatic properties for non-physiological substrate conditions, altering pH optima, changing substrate specificity, and improving stability have already been demonstrated to be feasible. Nevertheless, the ability to make useful proteins which radically differ from a natural structure or designing altogether new structures exceeds present understanding. (Author abstract) 41 refs.

Bryan, Philip N. (Genex Corp, Gaithersburg, MD, USA). *Biotechnol Adv* v 5 n 2 1987 p 221-234.

**086894 FLEXIBILITY AND RIGIDITY OF PROTEINS AND PROTEIN-PIGMENT COMPLEXES.** Proteins may be rigid or flexible to various degrees as required for optimal function. Flexibility of large parts of a protein, which rearrange or move are discussed. The author differentiates between several categories, although

the boundaries between them are diffuse: flexibility of peptide segments, order-disorder transitions of spatially contiguous regions, and domain motions. The domains may be flexibly linked to allow rather unrestricted motions or the motions may be constrained to certain modes. The various categories of large-scale flexibility are illustrated with examples. (Edited author abstract) 71 refs.

## Suspensions

**086895 STUDIES OF CAMEL CASEIN MICELLES: TREATMENT WITH SOLUBLE AND IMMOBILIZED NEURAMINIDASE.** Camel casein micelles were obtained from raw uncooled skim milk by ultracentrifugation, washing and then resuspending in UF-skim milk permeate. They were treated with neuraminidase, in both soluble and immobilized forms, to study the location and distribution of the glycosylated portion of camel casein micelle. Kinetic release of sialic acid, soluble in 12% TCA, was studied. Camel casein micelle contains 7.35 mg sialic acid per g casein; 99.3% of it was released with soluble neuraminidase, whereas only 90% was released with immobilized neuraminidase. This implies that about 90% of the glycosylated portion of camel casein micelle (glyco-k-casein-like component) is on the surface of the micelle. (Author abstract) 31 refs.

## Synthesis See Also BIOLOGICAL MATERIALS—Cartilage.

**086896 SYNTHESIS USING POLYMERIC REAGENTS.** It is shown that convenient and highly efficient condensation reactions take place by transferring polymer-bound electrophiles, the active esters, via a mediator, shadchan, to polymer-bound nucleophiles, the amines. On-line monitoring can be achieved - a most essential feature in planning a fully automatic, self-controlled machine for multistep syntheses. To widen the application scope of PRs (Polymeric Acyl-Transfer Reagents), we have also developed additional simple, convenient methods for preparation of polymers. Now we are able to maximize the loading of the PRs with protected amino acid and other reactive species, which should greatly expand the use of these methods. We believe that the mediator methodology is not limited to acylation and related processes but is also applicable to other chemical processes that involve the formation of activated intermediates. 23 refs.

**086897 PREPARATION OF  $^{15}\text{N}$ -LABELED L-ALANINE BY IMMOBILIZED L-ALANINE DEHYDROGENASE: DIFFERENTIAL INCORPORATION OF  $^{15}\text{N}$  IN BACTERIAL PROTEINS.** This paper describes a system for continuous synthesis of  $^{15}\text{N}$ -labeled L-alanine from lactic acid,  $^{15}\text{NH}_4\text{Cl}$  and NADH, which uses immobilized alanine dehydrogenase and soluble lactate dehydrogenase as enzyme sources. Lactic acid acts both as hydrogen donor for the regeneration of NADH and as pyruvate source, thus providing the carbon skeleton of L-alanine. *Citrobacter freundii* grown on synthetic media containing 17 unlabeled amino acids and L- $(^{15}\text{N})$ alanine as nitrogen source, incorporated 66% of  $^{15}\text{N}$  into alanine found in bacterial proteins. When  $^{15}\text{N}$ -labeled glutamic acid, aspartic acid or glycocol were added to the synthetic growth media, their  $^{15}\text{N}$  was 'diluted' among different amino acids of bacterial proteins. Isotope enrichment of L- $(^{15}\text{N})$ lysine found in newly

synthesized proteins of *C. freundii* was practically unchanged as compared to the isotope content of free amino acid in the growth medium. (Author abstract) 33 refs.

**086899 ROLE OF LYS SIDE CHAIN IN THE STABILIZATION OF  $\beta$ -TURN STRUCTURE.** Peptides containing Lys and Orn were synthesized to study the role of side chains in the formation of the  $\beta$ -turn structure. In contrast with peptides having a -Lys-Asp- sequence, peptides containing an -Orn-Asp- sequence do not adopt a  $\beta$ -turn structure. Analysis of the side chain rotamers shows that in Boc-Gly-Lys-Asp-OMe the Lys side chain can interact with the side chain of the neighboring Asp residue and this interaction contributes to the stabilization of the  $\beta$ -turn structure. The Orn side chain, instead of side chain-side chain interactions, interacts with the peptide backbone. (Author abstract) 19 refs.

**086900 PROTEIN ENGINEERING: METHODOLOGY, APPLICATIONS AND STATUS.** Developments in recombinant DNA (rDNA) technology have made selective alteration of primary amino acid sequences of proteins possible. Such manipulation using genetic engineering techniques has been referred to as protein engineering. Although this technology has seen only limited application in food research to date, this emerging and rapidly expanding technology offers exciting approaches to protein/enzyme modification studies, and may aid in the development of novel processes and/or more functional and nutritious proteinaceous foods. This review outlines some basic protein engineering methodology and strategies. In addition, examples are provided in which site-directed mutagenesis has been used advantageously in the specific modification of the enzymes subtilisin, lysozyme and chymosin, and of the casein proteins in milk and the storage proteins of potato tubers. These examples indicate the potential of protein engineering technology in investigations of structure-function relationships, stability, protein folding and conformation. (Author abstract) 128 refs.

**086901 PROCEDURES AND A COMPUTER PROGRAM FOR THE DETERMINATION OF FRACTIONAL PROTEIN SYNTHETIC RATES BY NUMERICAL SOLUTION OF AN IMPLICIT EQUATION.** Fractional protein synthetic rates may be determined in vivo by infusion with a labelled amino acid and measurements of the specific radioactivities of the free and protein-bound amino acid. The calculation requires the solution of an implicit equation which is usually done by the laborious and inaccurate method of interpolation from a series of standard curves. In this report a BASIC computer program (PROSYN) is given which enables a quick and accurate solution by a numerical method. The basis of several solution methods is described; the PROSYN program is capable of using either of two (bracketing and the secant method) of these procedures. (Author abstract). 11 Refs.

## Testing

**086902 FLUORESCENCE LIFETIME MEASUREMENTS OF MERCURY/PROTEIN COMPLEXES.** Fluorescence lifetime and steady-state fluorescence measurements are used to characterize various mercury/protein and mercury/protein/EDTA complexes. The proteins studied are ovalbumin,  $\alpha$ -chymotrypsinogen, and acid phosphatase. Mercury quenches fluorescence in ovalbumin with a change in lifetime, while in  $\alpha$ -chymotrypsinogen quenching occurs without a change in lifetime. No quenching by mercury is observed for acid phosphatase. EDTA causes a further small decrease in fluorescence for both mercury/ovalbumin and mercury/ $\alpha$ -chymotrypsinogen, while no change is observed for mercury/acid phosphatase. In all cases the decrease in fluorescence intensity is consistent with a static quenching mechanism. (Edited author abstract) 21 refs.

**086903 DYNAMIC NMR STUDY OF THE INTERFERENCE BETWEEN CYCLIC PROTON EXCHANGE, SELFASSOCIATION AND HINDERED ROTATION OF DIPHENYLFORMAMIDINE IN TETRAHYDROFURAN.** By measuring proton lifetimes as a function of concentration and of the deuterium fraction in the labile proton sites, it was established that two protons are transferred in every exchange process. Thermodynamic data of the association process obtained by the analysis of the chemical shifts, of the A/B populations and the proton lifetimes as a function of concentration agreed very well. These results are evidence that A forms only self-associated hydrogen bonded dimers with a cyclic structure in which the double proton transfer takes place. The observation of a kinetic HH/HD isotope effect of 20 at 178 K establishes this transfer as the rate limiting step of the overall proton exchange. (Edited author abstract) 71 refs.

**086904 MEASUREMENT OF  $^4\text{He-p}$  RECOIL CROSS SECTIONS.** The recoil cross sections of protons induced by  $^4\text{He}^+$  particles were experimentally determined in an energy range of 1.3-2.1 MeV at recoil angles of  $20^\circ$  and  $30^\circ$ . The angular dependence of the recoil cross section at 2.0 MeV was also measured. By using the principle of detailed balance, a calculation of S+ $^4\text{He-p}$  recoil cross sections were calculated from p- $^4\text{He}$  phase shift data. Good agreement between the experimental data and theoretical values was found. The results show that recoil cross section at low energies are non-Rutherford and are larger than the Rutherford value by approximately a factor of 2 at 2.0 MeV. (Author abstract). 9 Refs.

**086907 LOW-FIELD PROTON GYROMAGNETIC RATIO  $\gamma_p$  EXPERIMENT AT THE ETL.** The low-field proton gyromagnetic ratio  $\gamma_p(\text{low})$  experiment at the Electrotechnical Laboratory (ETL) has been continued with the construction of a nonmagnetic building, precision solenoid, and dimensional measuring apparatus. A tentative value of  $\gamma_p(\text{low})_{\text{ETL86}}$  and its uncertainty are given:  $\gamma_p(\text{low})_{\text{ETL86}} = 2.6751289(59) \times 10^8 \text{ s}^{-1} \text{ T}^{-1}$  (ETL 2.2 ppm). The sources of uncertainty have been carefully investigated. The irregularity of the solenoid diameter and the resistance calibration mainly caused the large uncertainty. In order to reduce the uncertainties, some improvements have been made and others are planned. 13 refs.

**086909 TOPOGRAPHICAL EFFECTS OF ROUGH SAMPLES ON GRAZING ANGLE PROTON SCATTERING.** Experimental results for proton scattering from rough Al samples are presented. The spectra are different from those of polished samples; the peaks are wider and sometimes present a double distribution with an abrupt change at low energy. In addition changes in energy spectra are observed with sample rotation. Some of the experimental results are compared with those predicted by a theoretical model but the fitting is not as good as with polished samples. (Author abstract) 12 refs.

**086910 ELASTIC SCATTERING OF PROTONS BY BERYLLIUM.** A new experimental technique has been developed to measure excitation functions for the  $^9\text{Be}(p,p)$  reaction. This technique uses thick targets and applies the elastic backscattering method. The angular distribution was measured for scattering angles from  $142^\circ$  to  $165^\circ$  in the proton energy region between 2300 and 2700 eV. Elastic scattering data were analyzed and fitted in terms of a combination of Breit-Wigner resonant cross sections and a constant background. The differential cross-section measurements were compared where possible to previous data using thin targets. Analysis of the present data indicates that the scattering is probably not s-wave but a mixture of p- and d-wave. The experimental technique is simple in practice and very time efficient. It can be used to make absolute measurements of the nuclear reaction or elastic scattering cross sections for many other projectile-target combinations. (Author abstract) 11 refs.

**Spectrum Analysis** See Also ACCELERATORS, CYCLOTRON—Applications; CAST IRON—Microanalysis; SPECTROMETERS.

**086916 ENERGY DEPENDENT PHASE SHIFT ANALYSIS OF PROTON-PROTON SCATTERING BETWEEN 700 AND 1300 MeV.** An energy dependent pp—pp phase-shift analysis for elastic proton-proton scattering is reported in the energy range between 700 to 1300 MeV. Almost all phase shifts smoothly connect with the previous results of the Saclay-Geneva phase shift analysis below 800 MeV. Due to recent Saturne II results the data base is now sufficiently abundant to perform such an analysis. Present results strongly disagree with the predictions of Arndt et al., for most phase shifts. Argand diagrams suggest a non-resonant behavior of the  $^3\text{F}_3$  partial wave and a resonance-like behavior for the  $^1\text{G}_4$  partial wave. (Author abstract) 69 refs.

Lehar, F. (CEN, Gif sur Yvette, Fr); Lechanoine-Leluc, C.; Bystricky, J. *J Phys (Paris)* v 48 n 8 Aug 1987 p 1273-1290.

**086917 DYNAMIC NUCLEAR POLARIZATION AND SPIN-LATTICE RELAXATION OF THE PROTON SPINS IN  $\text{Ca}(\text{OH})_2$ .** The dynamic nuclear polarization (DNP) of the proton spins in  $\text{Ca}(\text{OH})_2$  doped with  $\text{O}_2$ —centers was studied experimentally. The protons in the neighborhood of the  $\text{O}_2$ —centers which do not cross-relax with the other protons in the sample, due to their large hyperfine interaction with the  $\text{O}_2$ —centers, were identified. Using the position of the diffusion barrier, resulting from this identification, the spin-lattice relaxation process in  $\text{Ca}(\text{OH})_2$ : $\text{O}_2$  can be understood quantitatively. Also the shifts of the ESR-lines used for DNP, due to the demagnetizing field of the proton spins, can be calculated using the diffusion barrier. These shifts were

also observed experimentally and found to be in agreement with these theoretical calculations. (Author abstract) 17 refs.

Van der Zon, C.M.B. (Rijksuniversiteit Leiden, Leiden, Neth); Marks, J.; Wenckebach, W.Th.; Poulsen, N.J. *Physica B & C* v 145 n 2 May-Jul 1987 p 153-164.

**086918 RELATION BETWEEN DEPTH AND ENERGY IN CHANNELING EXPERIMENTS.** Spectra of protons backscattered from a silicon single crystal were measured at a bombarding energy of 2300 keV. A narrow resonance in the elastic scattering cross sections of protons from  $^{28}\text{Si}$ , at 2090 keV, shows up as a peak in the spectra. The position and the shape of this peak were found to vary when the beam alignment was changed from a random to an axial or planar crystal direction. These effects are attributed to a different energy loss distribution of the incoming protons in these three cases. The measured spectra were compared with spectra obtained from Monte Carlo simulations in which the dependence of the energy loss on the impact parameter of the collision is taken into account. The measured and simulated spectra were found to agree qualitatively. By analyzing the energy loss of the simulated trajectories, conclusions are drawn about the influence of the reduced energy loss in channeling directions on the energy to depth conversion in channeling experiments. (Author abstract) 17 refs.

## Theory

**086919 THEORY OF ADIABATIC PROTON TRANSFER IN HYDROGEN-BONDED COMPLEXES IN SOLVENTS OF LOW POLARITY.** The transfer of the proton from fragment A to fragment B is attended, not only by a displacement of ion  $\text{C}^-$  from A to B but also by a change in medium polarization. The authors adopt a simplified model for the calculation. The authors describe the medium polarization by the single effective dimensionless coordinate  $q$  and effective frequency  $\omega$ , and the ion  $\text{C}^-$  by the coordinate  $R$  and frequency  $\Omega$ . We shall simulate the adiabatic potential-energy surface of the reaction complex as a function of the classical reaction coordinates  $R$  and  $q$ . It is shown that even in the case of adiabatic reactions the medium will not set up a Frank-Condon barrier for ion  $\text{C}^-$  in its displacement to the transition configuration ( $R_{\text{eq}} \rightarrow R^*$ ). Medium reorganization occurs in configuration  $R^*$ , and corresponds to a redistribution of charge in the system in this configuration which is due to the proton jump from fragment A to fragment B. However, in contrast to nonadiabatic reactions, the relaxation characteristics of the medium do influence the dynamics of motion of the systems toward the transition configuration via the attenuation constant  $\Gamma_{\text{min}}$  which depends on to interaction constants of the ion and medium reaction modes with the thermostat. 4 refs.

**086920 ON THE ACCURACY OF MEASURING PROTON FLUENCE BY BEAM INTEGRATION, FOR THE DETERMINATION OF STOPPING POWER.** The energy dependence of the stopping power can be determined from the height of backscattering spectra when for different energies the fluence of the projectiles is measured. We list the possible errors when the number of protons hitting the target is deduced from the integrated beam current. It is shown, e.g., that a proper correction for dead time in the multichannel analyzer requires a stable beam current. Taking account

of all effects discussed, we find that for proton energies larger than 60 keV the fluence can be determined with a precision better than 1%. This is confirmed by comparing the calculated and the measured backscattering yields from a Au- and a Ta-target. To facilitate the determination of the backscattering cross section of the shielded target nuclei we use a fit formula applicable to all atoms heavier than Al, which was obtained from calculations using the scattering integral. (Author abstract) 16 refs.

**086921 CROSS SECTION OF PROTON RETARDATION OVER A BROAD ENERGY RANGE.** In describing the cross section of proton retardation, three energy ranges are isolated. At high velocities (proton energy > 1.2 MeV), the Bethe-Bloch formula may be successfully used. The theory is used to describe the low velocity region (proton energy < 50-100 keV). The most difficult region to describe is that of intermediate energy, where there is a maximum in the curve of the retardation cross section as a function of the energy. In this case, empirical and semiempirical expressions are used. In each of these energy ranges, a different parameterization is used, and it is difficult to cross from one region to another. In connection with this, the problem of modifying the Bethe-Bloch expression so as to be applicable for the regions of low and intermediate energy is posed. 7 refs.

**086922 METHOD FOR THE DETERMINATION OF PROTON ENERGY LOSS IN INTERMEDIATE THICKNESS SAMPLES BY PIXE MEASUREMENTS.** The proton energy loss in an intermediate thickness sample is determined from the decrease in the x-ray intensity of a reference element after the passage of the proton beam through the sample to be analyzed by PIXE. Using this method we have determined proton energy loss in superchlorine filter-paper (4 mg/cm<sup>2</sup>), which is used at the filtering stage of the single orifice cascade impactors. The results show good consistency for the several elements used in our experiment. The selection for the reference element is also discussed. (Author abstract) 11 refs.

**Earthquake Resistance**

**086927 SAN SALVADOR EARTHQUAKE OF OCTOBER 10, 1986 - PERFORMANCE OF LIFELINES.** Although the October 10, 1986 San Salvador earthquake was only a moderate event of magnitude 5.4 and the recorded ground motions had a relatively short duration, the high recorded peak accelerations caused substantial damage to lifelines. There was significant and widespread damage to buried lifelines. Long-distance telecommunications facilities were reportedly undamaged, but there was substantial loss of local phone service caused by damage to buildings, failures of equipment racks, and loss of emergency power (tilting of batteries). Power generating facilities (hydroelectric and geothermal) that supply electricity to San Salvador are located too far from the city to have been affected by the earthquake. As has been observed in past earthquakes, control and instrumentation systems and low-voltage power-supply equipment displayed an ability to withstand high ground accelerations. (Edited author abstract) 2 refs.

**Maintenance**

**086928 COMPUTER SYSTEM CONTROLS ALL MAINTENANCE ACTIVITIES.** Lynn Haven, Florida, a city of 9,000 residents has created a system to monitor and control all maintenance activities throughout the public works department. The system monitors and

controls all activities. Every scheduled maintenance action is approved by issuing a work-order to the responsible department and is monitored through to completion. The system is also used to capture all those citizens' requests for service. If a call is received to pick up trash, an unscheduled work order is issued after the request is entered in the computer and it is monitored until the work is completed.

Hartenstein, Alan (Pitman-Hartenstein & Ashe Inc, Jacksonville, FL, USA). *Public Works* v 119 n 1 Jan 1988 p 60.

**086929 PROCEDURES AND DEVICES FOR UNDERWATER CLEANING OF CIVIL WORKS STRUCTURES.** Civil works structures must be continually evaluated for structural safety, stability, and operational adequacy. Proper inspection and evaluation of them to identify deficiencies will usually require some type of cleaning of the structure. A wide variety of underwater cleaning tools and methodologies have been developed and are currently in use in the offshore oil industry and by the US Navy. These tools range from hand-held scrapers to powered tools and high-pressure waterjets. Several tools have been specifically designed for removal of underwater debris. These tools include jet educators, dredges, and air lifts. This report summarizes underwater cleaning procedures and devices that are appropriate for use on civil works structures. The application, advantages, disadvantages, and operation of each type of equipment are discussed, along with recommendations for those tools best suited for specific conditions. (Author abstract) 16 refs.

**086930 EXCELLENCE THROUGH MANAGEMENT LEVERAGE: AN ALTERNATIVE TO AMERICA IN RUINS.** Public institutions are in a state of crisis in their attempts to render basic services. The Pennsylvania Department of Transportation is a case in point that management performance is integral to a sound public organization. Public sector management is an important business. It represents roughly one-third of our economy. What public sector managers do is to provide the lubricants to a civilized society, a society in which private, social and economic aspirations can be realized. And finally, the public sector is not a place where the benefits of intelligent management are lost. On the contrary, the public sector fields are ripe for harvest using the tools of enlightened management. It is possible to achieve public sector excellence through management leverage. 10 refs.

Larson, Thomas D. *Civ Eng Pract* v 2 n 2 Fall 1987 p 25-34.

**086931 COST COMPARISON MODEL FOR CONTRACTING OUT GOVERNMENT SERVICES.** Faced with significant funding shortfalls for the construction, repair, maintenance, and operations of public infrastructure and delivery of public services, governments have searched for strategies to alleviate the funding shortages. Privatization has emerged as a promising alternative to traditional service-delivery approaches. Contracting out the operations of public services, a subset of privatization, offers significant cost savings through competitive bidding for public services. A model that provides a method for making valid cost comparisons between the total costs of private and public performance of public services is presented. Special attention is given to the computation of the additional costs of contract performance. A case study involving solid waste collection and disposal is provided to demonstrate the use of the cost comparison model. (Author abstract) 5 refs.

## Productivity

**086932 PUBLIC WORKS PRODUCTIVITY: BEYOND CUTBACK TO CREATIVITY.** This technical note is based on extensive research and interviews with public works directors in the USA. It examines the rapidly evolving field of public works productivity and reflects state-of-the-art management practices, such as the modernization of public works procedures and operations and increased inter-governmental co-operation among public agencies in North America. The topics examined include ways to better manage existing resources, programs to increase productivity, ways to raise revenues without increasing taxes and the use of more sophisticated financial techniques. Twenty-eight public works productivity trends now being used in local governments throughout the country are described.

## PULP

## Additives

**086933 MECHANISM OF FINES AND FILLER RETENTION IN NEWSPRINT FURNISHES: CHEMICAL ADDITIVES AND PAPER MACHINE WHITE WATER.** Pulp samples from various locations of a newsprint mill were treated with a number of chemical additives. Bentonite proved to adsorb the inorganic contaminants such as sodium silicate coming from the bleaching operation. Chemical additives such as bentonite, microtalc, and zirconium oxychloride were found to be effective in reducing the TOC, soluble lignin, and turbidity of the pulp slurry. X-ray diffraction analysis indicated that bentonite underwent lattice expansion, which could be the fundamental reason for its capability of adsorbing the contaminants in the white water, making it an effective retention aid in combination with polyacrylamide. Coflocculation of fines and filler with a suitable retention aid proved to be effective in improving retention. Cationic starch in combination with an anionic silicic acid colloid was able to produce clay-filled sheets with minimum loss in strength properties. (Author abstract) 18 refs.

## Analysis

**086934 SOLID-PHASE EXTRACTION TECHNIQUES IN THE PULP AND PAPER INDUSTRY.** Solid-phase extraction cartridges are an aid in the separation of organic species commonly found in pulp and paper mill systems. Defoamers, rosin sizes, deposits, and black liquor samples can be analyzed with these cartridges. The advantages of using these cartridges include smaller sample and solvent requirements, less labor per sample, and simpler use than with conventional solvent extraction techniques. (Author abstract) 12 refs.

Sweeney, Kevin M. (Int Paper Co, Mobile, AL, USA). *Tappi J* v 71 n 1 Jan 1988 p 137-140.

**086935 DISPERSED RESIN IN BLEACHED KRAFT PULP MILLS.** Several properties of the dispersed resin in bleached kraft pulp mills have been investigated. Average concentrations of resin particles in filtrates of pulps from various points along the process stream are reported. For each sampling location, the change in particle concentration with time of pulp sample storage at 5°C has been determined. In the future, this will enable rough estimation of original concentrations when samples must be measured a few days after collection. Size distributions of resin particles were the same at all sampling points, from which it follows that, in practice, the relationship between concentration and deposition rate is relatively unaffected by size distribution. Dispersed resin particles were negatively charged throughout the mills. The low charge observed in C-stage pulps was insufficient to confer stability, which further supports the hypothesis that the dispersed resin is heterocoagulated

with the fibers in this acidic stage. (Author abstract). 11 Refs.

## Applications See MORTAR—Fiber Reinforcement.

**Bleached** See Also PAPER AND PULP MILLS—Modernization; PAPERMAKING; PULP MANUFACTURE—Bleaching.

**086936 EXTENDED DELIGNIFICATION, AND ALTERNATIVE TO CONVENTIONAL KRAFT PULPING.** Mill and pilot plant data for market-grade bleached pulp were evaluated. The pulp quality was equivalent to or better than that of bleached pulps obtained by conventional kraft pulping and bleaching techniques. However, operating parameters favored extended cooking in the rapid displacement heating process. These parameters were lower active alkali consumption, lower bleaching chemical demand, and lower bleach plant effluent liability. (Author abstract) 8 refs.

Mera, Fernando E. (Beloit Corp, Portland, OR, USA); Chamberlin, Jeffrey L. *Tappi J* v 71 n 1 Jan 1988 p 132-136.

**086937 RAPID CAUSTIC EXTRACTION OF CHLORINATED PULP.** Up to 94% of the lignin that can be removed in the first caustic extraction stage of a conventional process can be removed rapidly from well-chlorinated pulp with two countercurrent displacements with caustic. The time per displacement can be as short as 1.7 s. A slight loss in extraction efficiency is more than made up by improved washing efficiency. On a commercial scale, the chlorinated pulp can be formed into a sheet, washed, extracted twice, and washed three times on a six-stage horizontal washer. Caustic requirements are 2/3 that of a conventional extraction. Energy requirements are lower than in a conventional bleaching. This technology also presents an opportunity to lower the capital cost of a bleaching. (Author abstract) 13 refs.

Histed, J.A. (CIP Research Ltd, Hawkesbury, Ont, Can); Canovas, R. Vega. *Tappi J* v 71 n 3 Mar 1988 p 157-161.

**086938 PHOTOYELLOWING SIMULATION OF BLEACHED HIGH YIELD WOOD PULP BY LIGNIN MODELS INCLUDED IN A SOLID CARBOHYDRATE MATRIX.** A series of lignin model molecules was prepared, adsorbed and grafted (for the most appropriate one) on to bleached chemical pulp. The rates of brightness reversion of these solid materials under simulated solar light exposure were established and compared to that of bleached mechanical pulp (containing lignin). 4-hydroxy-3-methoxy acetophenone (acetovanillone or acetosyringone) 1 and 3, 5-dimethoxy-4-hydroxy acetophenone (acetosyringone) both incorporating  $\alpha$ -carbonyl and phenolic functions which have been claimed essential for an efficient coloration, did not prove to be very active in the solid state. In contrast,  $\alpha$ -carbonyl  $\beta$ -0-4 and  $\beta$ -1 structures with whether phenolic function or not, display an intense yellowing in this medium, and mimic well the brightness reversion of bleached mechanical pulp (especially the non phenolic  $\beta$ -0-4 chromophore adsorbed and grafted). These results are in contrast with those found in liquid ethanolic solution where acetovanillone 1 (conc. =  $10^{-2}$  M) and the  $\alpha$ -carbonyl 4-0-methylated  $\beta$ -0-4 dimer 3 (conc. =  $3.7 \times 10^{-3}$  M) were shown to undergo a similar yellowing. (Edited author abstract) 22 refs.

## Chemical

**086939 SODA ASH - THE PAPERMAKER'S ALTERNATIVE TO CAUSTIC SODA.** When caustic soda is unavailable or its price versus soda ash increases sharply, soda ash becomes an excellent alternative and a source of potentially significant savings. When making an economic comparison of the two products for kraft

pulping, calculate the prices on an equivalent sodium oxide product. In this case, it requires 1.31 times more dry soda ash than liquid caustic soda (dry bases) to obtain an equivalent sodium oxide content. In addition to the chemical's costs, the installation of soda ash storage and handling equipment must be considered. To facilitate handling, soda ash is often stored as a solution or as a slurry. Recently, an efficient hydrator, called the General Chemical Hydrator System, has become available, allowing a mill to convert dry soda ash on-site to either a liquid or a slurry. This system greatly simplifies the transfer of soda ash from rail hopper cars to storage.

Wortley, Barbara (General Chemical Corp). *PIMA Mag* v 70 n 7 Jul 1988 p 40-41.

## Chromatographic Analysis

**086940 CLASSAGE DES FIBRES PAPETIERES PAR CHROMATOGRAPHIE HYDRODYNAMIQUE CAPILLAIRE.** [Classification of Pulp Fibers by Capillary Hydrodynamical Chromatography]. The classification of pulp fibers with capillary hydrodynamic chromatography was studied quantitatively. With a tube of sufficient length and with the hypothesis that in the tube of diameter D the velocity distribution is parabolic, the mean radial position of fibers of mean length verifies a provided relation (a). The observed selectivity of classification depends on Reynolds number in the flow and on the constant K. For all experiments performed the selectivity followed a second provided relation. With a given set of experimental conditions the axial dispersion is the lower and the selectivity the higher is the value of K. (Author abstract) In French. 14 refs.

Elie, Pascale (CNRS, St. Martin D'Heres, Fr); Renaud, Maurice. *Entropie* v 23 n 136 1987 p 33-40.

## Cleaning

**086941 OPTIMIZED PULP CLEANING TAKES DISCIPLINE, ORGANIZATION.** Cleaning systems are designed for specific quality and tonnage requirements. The goal is to produce acceptable quality with the lowest possible energy consumption and minimal sewer loss. Cleaning systems are made up of successive stages of hydrocyclones. All hydrocyclones operate on a percentage basis. None removes all the contaminants, but most of the time, cleaning systems do an adequate job in producing quality paper. Probably the most common inefficiency of cleaning systems in the paper industry is wasting energy. Pumps, driven by electric motors, move pulp through pipes, valves and cleaners. The energy losses can occur throughout the system, or in one or more stages. Keeping a cleaning system operating at peak performance is a necessity. What is required to get the most out of a cleaning system on an ongoing basis is the organization and discipline to keep optimization a top priority.

**Composition Effects** See PAPERMAKING MACHINERY—Protection.

## Contamination

**086942 PLASTIC CONTAMINATION IN THE PULP MILL: AN OVERVIEW.** Plastic contaminants create serious quality problems for the papermaker. Major sources of plastic in the pulp mill are the chip supply, construction materials and consumer plastics. After proper identification the contaminants can then be traced back to source. An effective control program requires strong management commitment to succeed. This can be followed by the formation of a steering committee, education of mill personnel and installation of new cleaning systems if necessary. (Author abstract) 8 refs.

## Flocculation

**086943 FIBER FLOCCULATION IN PULP SUSPENSION FLOW: PART 2. EXPERIMENTAL RESULTS.** The purpose was to quantify the primary effects and the interaction effects of selected factors on floc size distribution and, hence, on the uniformity of fiber dispersion. Factors studied include consistency, velocity in turbulent flow, temperature, and fiber surface characteristics. Fiber dispersion is enhanced as consistency, fiber length, and temperature are decreased, with the first two variables being dominant. Velocity has a complex influence, but flocculation is generally minimized by increasing velocity in turbulent flow. Electrostatic field effects have a strong influence on the floc size distribution. These results are based on coupling the theoretical model of Part 1 with experiments using digital signal analysis of light transmission through flowing pulp. (Author abstract) 6 refs.

## Grafting

**086944 XANTHATE METHOD OF GRAFTING. X. GRAFTING OF ACRYLAMIDE ONTO VERY-HIGH-YIELD CHEMITHERMOMECHANICAL BIRCH AND ASPEN PULPS.** Hardwood pulp (birch: Betula Papyfera Marsh, and aspen: Populus Tremuloides Michx) has been copolymerized with acrylamide using the xanthate grafting method. Grafting has been initiated using a redox system of ferrous ion and hydrogen peroxide. The effect of operating conditions on grafting parameters was also investigated. The factors studied were initial pH, time, and concentrations of hydrogen peroxide and acrylamide. When birch was used as a substrate, grafting parameters were as follows: grafting efficiency 82%, degree of conversion 35%, and polymer loading 60%. In the case of aspen, the maximum level of grafting efficiency, i.e., 87%, was reached with a polymer loading of 60%. Nevertheless, as in the case of birch, the conversion reached a rather low-level reading, i.e., 50%. Finally, some mechanical properties of paper sheets obtained through grafted pulps (dry and wet breaking lengths, dimensional stability, modulus, and extension at break) are compared to those of standard paper sheets. (Author abstract) 11 refs.

**Kraft** See Also PULP MANUFACTURE; PULP MANUFACTURE—Mathematical Models.

**086945 INFLUENCE OF OXYGEN DURING PRE-TREATMENT OF KRAFT PULP WITH NO<sub>2</sub>.** Large additions of O<sub>2</sub> during the pretreatment of modified or industrial kraft pulp with NO<sub>2</sub> under conditions which favored an autocatalytic generation of NO<sub>2</sub> from produced and added HNO<sub>3</sub> led to a decreased viscosity after a subsequent oxygen bleaching, if the comparison was made at high kappa numbers. The difference was less apparent when the oxygen bleaching was extended. The yield of pulp at a given kappa number was reduced by large O<sub>2</sub> additions. An increased yield of nitric acid contributed to these effects. (Edited author abstract) 11 refs.

Kalen, Gunnar (Mo och Domsjö AB, Örnsköldsvik, Sweden); Samuelson, Olof; Svedmark, Gunnar. *J Wood Chem Technol* v 7 n 2 1987 p 245-258.

**086946 OXYGEN BLEACHING OF KRAFT PULP: HIGH CONSISTENCY VS. MEDIUM CONSISTENCY.** An advantage with oxygen bleaching is that oxygen is cheap and that little electricity is needed for the production of the oxygen compared with the electricity requirement for other bleaching chemicals. Because organic chlorinated components are harmful to organisms living in water, the restrictions on the discharge of these components will probably become stricter. A big step forward to reduce such components is the introduction of

oxygen bleaching. In most cases, medium-consistency oxygen bleaching will probably be installed because the selectivity is slightly better than that of high-consistency oxygen. With pre-stages under development, such as that using nitrogen dioxide, PRENOX, the selectivity can be even better, and this improvement can be used for further delignification in the oxygen stage. Pulp viscosity at a given degree of delignification is slightly higher for medium-consistency bleaching than for high-consistency oxygen bleaching. 5 refs.

**086947 RESIDUAL LIGNIN IN UNBLEACHED KRAFT PULP. PART I - ALKALI-EXTRACTION OF RESIDUAL LIGNIN FROM UNBLEACHED KRAFT PULP SOLUTION.** Unbleached kraft pulp containing 4.7% Klason lignin has been found to dissolve completely in several nonaqueous cellulose solvents. Extraction of the residual lignin in the unbleached kraft pulp from these solutions was attempted using several kinds of solvents for kraft lignin and hemicelluloses. When the solvents for only kraft lignin were used, a small amount of the residual lignin (< 7% of the original residual lignin) was extracted. On the other hand, 24% sodium hydroxide solution extracted approximately one-half of the residual lignin together with polysaccharides. These results indicate that the residual lignin has some chemical linkages with some polysaccharides. (Author abstract) 15 refs.

## Leaching

**086949 MOLECULAR WEIGHTS OF LIGNOSULPHONATE AND CARBOHYDRATE LEACHED FROM SULPHITE CHEMIMECHANICAL PULP.** The molecular weights of both the lignosulphonate and carbohydrate fractions leached from sulfite chemimechanical pulps increased as the leaching proceeded. Lignosulfonate molecular weights rose from 1100 to 6100. Values for the carbohydrate fractions were lower, ranging from 6000 to 17000. For the lignin, the diameter of the equivalent sphere corresponding to the whole sample leached was considerably higher than the medium-pore diameter of the fiber. This discrepancy indicated that the lignosulfonate macromolecule in the fiber wall adopted a flat conformation. (Author abstract) 13 refs.

**086950 CHARACTERIZING MECHANICAL PULPS FOR PAPERMAKING.** The works surveyed here demonstrate that: direct measurement of pulp-slurry properties can be used in place of handsheets as process control tests; a range of slurry tests utilizing filtration resistance and physical separation of pulp into particle-size classes have been and are being developed for on-line use; efforts directed at characterization of the fines fraction would be worthwhile; pulp-slurry tests based on optical and acoustical principles are developed to greater or lesser degrees; test equipment now being marketed can measure several pulp properties in concert; and better

instrumentation of mechanical pulping processes will enable better control of pulp quality through manipulation of process variables. 48 refs.

Veal, M.A. (Weyerhaeuser Co, Tacoma, WA, USA); Jackson, M. *Tappi J* v 70 n 10 Oct 1987 p 88-90.

**086951 USING THE DRAINAGE TIME TO EVALUATE MECHANICAL PULPS.** In most research papers on the characterization and evaluation of mechanical pulps, the characterization factors correspond to the average fiber length and shape of the particles in the pulp. Taking into account that the drainage behavior is important in evaluating a pulp, the authors studied the drainage phenomenon as it occurs in the standard sheet machine. They found that the drainage behavior can be characterized by only one parameter, the 'resistivity' (R) which can be readily determined from the drainage time test by using any sample weight within a wide range and using running water with no temperature requirements. 4 refs.

## Microscopic Examination

**086953 LASER TECHNOLOGY OFFERS NEW WAY TO MEASURE FURNISH COMPONENTS.** The basic principle of operation of the scanning laser microscope is presented. The light output from a laser diode is focused down to a diffraction-limited beam spot. At the focal point the light beam is very intense (light density greater than 1 MW/in<sup>2</sup>) and is able to pick up even smaller filler particles down to 1 micron in size. The size of an individual particle is determined by measuring how long it takes for the scanned beam to sweep across it. The laser beam is scanned at a fixed velocity so that the width of each backscattered light pulse (transit time) is a direct measurement of the size of that individual particle. The beam is scanned rapidly to make the device insensitive to variations in particle flow velocity. The device classifies particles into eight different size fractions, from 1 to 250 microns. To make sure the result are repeatable, each test sequence was repeated at least twice. Test results clearly show that the laser back-scattering technology is a very powerful tool to make measurements on pulp slurries that have not previously been possible with other kinds of devices.

Hanseler, Jamie (Univ of Washington, Seattle, WA, USA); McKean, William. *Pulp Pap Can* v 89 n 9 Sep 1988 6p.

## Mixing

**086954 SYSTEMS APPROACH TO CONSISTENCY CONTROL AND DRY STOCK BLEND.** A process control strategy to blend pulp on a fiber weight basis was developed for the wet end of the paper machine. There are several problems with conventional consistency control that adversely affect this strategy. These difficul-

ties include control loop interaction between furnish flow and consistency; variable process gain arising from changes in furnish flow and storage tank consistency; and variable process dead time also caused by changes in furnish flow. These problems can be solved with a new method for consistency control and a continuous self-tuning algorithm that uses only process data to adapt controller gain and reset. The benefits of using this system can include a reduction in furnish costs and blend variability, enhanced quality machine runnability, and a more uniform sheet. (Edited author abstract).

Dumdie, Dan P. (Daishowa America Co, Port Angeles, WA, USA). *Tappi J* v 71 n 7 Jul 1988 p 135-139.

## Moisture Effects

**086955 MEASUREMENT OF THE ELECTRICAL SPECIFIC CONDUCTIVITY OF A WET PULP WEB.** Wood pulp fibers generally contain electrolytes and dissociative groups, such as the carboxyl group. The dissociation of these groups depends on the physical state of water within the pulp web. Therefore, the relationship between the electrical conductivity and the amount of water in the wet pulp web can be expected to characterize the state of the water in the pulp web. This article describes the measurement of the electrical specific conductivity of wet pulp webs with water contents (g water/g fiber) ranging from about 30% to about 400%. The method used is one that was developed primarily for electrolyte solutions. This method uses an alternating-current bridge and is suitable for wet pulp webs because it avoids polarization at the electrodes. The experimental results show that specific conductivity can be used to evaluate the degree of pulp beating. 6 refs.

Yamauchi, T. (Kyoto Univ, Kyoto, Jpn); Murakami, K. *Tappi J* v 71 n 3 Mar 1988 p 177-178.

**Physical Properties** See Also PULP MANUFACTURE—Waste Liquor Utilization; PULP MATERIALS.

**086956 FIBRE-TO-FIBRE BONDS IN PAPER. PART I. MEASUREMENT OF BOND STRENGTH AND SPECIFIC BOND STRENGTH.** A technique has been developed for the determination of fiber-to-fiber bond strength and specific bond strength, i.e., bond-breaking energy per unit of sample area and bond-breaking energy per bond-broken optical surface area, respectively. The technique is based on the controlled delamination of the sample using a specially designed free-rotating wheel to maintain the same geometry throughout the whole measurement under slow, quasistatic conditions. Results obtained on a series of handsheets of bleached kraft pulp of different bonded area prepared under various beating and wet pressing conditions indicate clearly that bond strength increases with an increase of total bonded area while the specific bond strength remains nearly constant. (Edited author abstract) 23 refs.

## Spectroscopic Analysis

**086958 STUDY OF BEATEN PULPS BY MICRO-WAVE SPECTROMETRY.** The new technique of micro-

wave spectrometry has been used to study the hydration of beaten and unbeaten pulps - both kraft and sulphite. The aim is to clarify the concept of hydration in terms of the greasy or slippery feeling of beaten pulp suspensions. The authors describe their research methods and conclude that it is possible to quantify the term of hydration by the measurement of the dielectric properties of a sample of pulp. (Author abstract) 13 refs.

Henry, F. (Cent Technique du Papier, Grenoble, Fr); Brandt, A.; Noe, P. *Pap Technol Ind* v 28 n 9 Dec 1987 p 722-726.

**086959 ESTIMATION OF LIGNIN IN WOOD PULP BY DIFFUSE REFLECTANCE FOURIER-TRANSFORM INFRARED SPECTROMETRY.** A method has been developed for estimating lignin in unbleached pulps using diffuse reflectance Fourier-transform infrared spectrometry. The procedure is based on linear relationships found to exist between the area of the 1510-cm<sup>-1</sup> infrared band, measured on diffuse reflectance difference spectra, and kappa number and Klason lignin. These relationships, which serve as calibration lines for lignin estimation, apply to a range of hardwood and softwood pulps from high-yield and conventional kraft processes (1-20% lignin, 10-120 in kappa no.) and from the alkaline sulfite anthraquinone process. An unknown sample's 1510-cm<sup>-1</sup> band area is referenced against the calibration line to estimate its lignin content. This method is nondestructive, it requires no sample preparation other than drying, it employs no calculations, and it may be used on samples as small as 0.05 mg. (Author abstract) 13 refs.

**Sulfate** See PULP MANUFACTURE.

## Sulfite

**086960 PRESSURIZED GRINDING OF CHEMICALLY TREATED WOOD.** Mild sulfonation of softwood prior to mechanical defibration yields pulp with enhanced strength properties. Development of the chemi-groundwood process has been hampered by the dimensions of the raw material to be impregnated. This study shows that impregnation with sodium sulfite solutions at elevated temperature is successful at short impregnation times. Pressure grinding of the mechanically treated wood did produce CPGW pulps that in many respects are comparable to CTMP. Compared to the reference PGW pulps, the CPGW pulps had a higher long fiber content and 50-100% higher tensile and tear strengths, but optical properties suffered, as expected. (Author abstract)

## Suspensions

**086962 THEORETICAL ASPECTS OF A PULP SUSPENSION FLOWING IN A CONVENTIONAL HYDROCYCLONE.** Industrial hydrocyclones separate dispersed dense material from a fluid of lower density. The presence of fibers impairs the separating efficiency by reducing the spin velocity in the main flow. In this study, a viscosity model for a pulp suspension in a hydrocyclone is used to obtain a numerical solution for the spin velocity. Calculated efficiency curves depend on the geometry and operating conditions of the hydrocyclone and on a parameter contingent on the concentration of the pulp suspension. (Author abstract) 12 refs.

v 71 n 1 Jan 1988 p 125-128.

**086963 FIBER FLOCCULATION IN PULP SUSPENSION PART 1: THEORETICAL MODEL.** A theoretical model has been developed to provide quantitative relationships describing flocculation in pulp suspension flow. This model is based on the mass-action law and on the energy spectrum of the turbulent flow. Electrostatics contributions are calculated by minimizing the free energy of bound counterions using the Poisson-Boltzmann field. The model is supported by an experimental study based on digital signal analysis using light transmission through the flowing pulp. (Author abstract) 8 refs.

**Testing** See Also PULP MANUFACTURE—Kraft Process.

**086964 STFI OPTI-KAPPA ANALYZER.** The content of lignin in the pulp is a very important parameter for the operation and control of the cooking and bleaching processes. One way of estimating the lignin content is through chemical determination of kappa number in the laboratory. The laboratory method measures the demand for potassium permanganate during oxidation of the pulp under certain standardized conditions, and thus provides an indirect determination of the lignin content. The STFI optical method, based on the ultraviolet (UV) light absorption by the lignin in the pulp, provides an alternative method of indirectly determining the lignin content.

**086965 VARIABLES IN CHEMI-THERMOMECHANICAL PULPING OF NORTHERN HARDWOODS.** In Mead's two-stage CTMP process, varying the caustic charge in the first stage had the greatest impact on refining energy and on pulp optical and physical properties, while the effect of sulfite in the second stage was also significant, especially at higher cooking temperatures. Main objective in this study of the two-stage process was to determine quantitative relationships between the major operating variables and the corresponding pulp properties obtained. 5 refs.

**086966 USING CTMP FLUFF PULPS IN NONWOVEN PRODUCTS.** A new generation of CTMP fluff pulps has been developed for use in hygiene products. In laboratory tests, the FPPRI compared a 100% CTMP pulp with two Scandinavian and two North American kraft pulps. The results show significant improvements in quality and suggest that if pulp producers and converters co-operate, greater improvements and much wider uses are possible. It seems that proper shedding is the key - the converter can improve the quality of his products and save energy and raw material if his shredding system is right. (Author abstract)

**086967 REFINER HYDROGEN PEROXIDE BLEACHING OF THERMOMECHANICAL PULPS.** The feasibility of the simultaneous pulping and bleaching of Norway spruce wood chips in the Kumagai Riki Kogyo (KRK) experimental pressurized laboratory refiner was investigated. Bleaches were made in both the primary and secondary stages of the TMP thermomechanical pulping process. All experimental work was aimed at developing operating parameters for refiner bleaching that do not require the use of scale-forming sodium silicate. Second-

ary-stage refiner bleaching using diethylenetriamine pentamethylene phosphonic acid (DTPMP) as a peroxide stabilizer produced comparable brightness gains (10.40%) with methods simulating tower bleaching at a much shorter reaction time, therefore avoiding the use of sodium silicate and expensive bleaching towers. (Author abstract) 6 refs.

Sharpe, Patrick E. (Sprout-Bauer Inc, Muncy, PA, USA); Rothenberg, Samuel. *Tappi J* v 71 n 5 May 1988 p 109-113.

**086968 APPROACH TO THE MEASUREMENT OF PULP RESIDENCE TIME IN A CHIP REFINER.** A method has been devised for measuring the residence time of pulp in a chip refiner. It is based on determining the mass of pulp between the bars of the refiner at a given time. This is done by deriving the stress/strain curve in compression of the pulp mat in the refiner and then matching the curve to an appropriate curve from a set obtained by compressing pulp pads of differing mass concentrations in a laboratory press. The compressive stress in the refiner is obtained by measuring the axial thrust, and the compressed thickness by measuring the true plate clearance. A preliminary application of the technique has indicated that an atmospheric chip refiner was operating at 16% of bar capacity during first-stage refining and at 5% during second-stage refining. The average radial velocity of the pulp, the number of bar impacts, and the average specific energy transfer have been calculated for each stage from these results. (Edited author abstract) 6 refs.

**Unbleached** See Also LIGNIN—Analysis.

**086970 STRENGTH POTENTIAL OF UNBLEACHED KRAFT PULPS.** Unbleached, bleachable-grade softwood kraft pulps made in a pilot plant were 20 to 40% stronger in tear-tensile performance than pulps made in mills from the same chips under similar pulping conditions. Unbleached hardwood kraft pulps, compared in the same way, showed no strength differences. Of the factors which might explain the softwood 'strength gap', one of the most likely is that after cooking is complete, the fibers are damaged physically as they are transferred from the pressure vessel to the atmospheric side of the mill. (Author abstract) 13 refs.

**PULP DIGESTERS** See Also PULP MANUFACTURE—Cooking.

**086971 BASKET CASES: KRAFT PULPS INSIDE DIGESTERS.** The hanging of baskets in batch digesters has a long history in the chemical pulping industry, but the record of results is largely relegated to the private files of pulp and paper companies. This paper reviews the results of many such basket experiments in a variety of mills. What emerges is a comprehensive picture of the physical quality of pulp inside digesters at the end of kraft cooking, and a realization that the strength loss problem demands a solution. Never-blown 'basket' pulps from

kraft batch digesters processing softwoods are considerably stronger than the corresponding pulps blown from these digesters. This generality holds true across a range of softwood species and is not affected by whether the digester is heated directly or indirectly. The pulp inside many continuous digesters is probably also much stronger than the pulp which reaches the washers. The chemistry of cooking is generally satisfactory, but the physics of blowing is not. The strength loss problem caused by blowing will be solved only by finding an appropriate means to transport cooked material out of the digesters at the end of kraft pulping. 13 refs.

## Control

**086972 DISTRIBUTED CONTROL SYSTEM APPLICATIONS.** A dual vessel, hydraulic, continuous digester has been installed at Longview Fibre Company, Longview, Washington. The controls for the digester have been implemented in a microprocessor-based distributed system utilizing proven computer-based strategies. Such functions as production change, alkali-wood ratio, digester level, and diffuser control were included. Sensors were used to measure properties such as white liquor and cooking liquor strengths. The system was initially used extensively in a freestanding emulation mode for operator training. Examples of selected control functions are detailed to illustrate the ability to configure logic and calculation intensive strategies. (Author abstract) 4 refs.

Glenn, M. (Longview Fiber Co, Longview, WA, USA); Kurth, T.; Farrar, D. *Process Technol: A Compil of Rec Eng Conf Pap on Process Control and Simul Publ by TAPPI Press, Atlanta, GA, USA, 1985* p 15-17.

**086973 APPLICATION OF DISTRIBUTED CONTROL TO BATCH/KAMR DIGESTER OPERATION.** In 1981, James River Corporation converted twenty year old instrumentation on six batch and one Kamr digester to modern digital distributed control. Two geographically separated control rooms were combined and located next to existing washer and bleaching control rooms to achieve centralized control of pulp mill operations. CRT based regulatory controls were installed to interface directly with the process, and a supervisory host computer used to implement model based, advanced controls. Motor control and safety interlocking is all solid state programmable logic (PLC) - communicating with regulatory and supervisory controls on a common data highway. The conversion has been highly successful, resulting in a streamlining of pulping operations, implementation of more effective pulping control strategies and significant savings in energy, chemicals, higher yields and increased throughput. (Author abstract)

## Energy Conservation

**086974 MILL EXPERIMENTS WITH DISPLACEMENT HEATING.** Digester steam savings of up to 45% were achieved from a displacement heating technique in an experimental digester. Digester heat was recovered by displacing the hot cooking liquor with brown stock washer filtrate. This hot liquor was used to pre-heat the white liquor charge and to be the black liquor charge. In order to reduce rejects and improve yield, the chips were steam packed and pre-steamed. The displacement heating would result in further energy savings at the deaerator and evaporators. (Author abstract)

**086976 PRETREATMENT OF KRAFT PULP WITH NO<sub>2</sub> IN A TWO-STAGE PROCESS.** Pulps with kappa number 3.5 and an intrinsic viscosity of 950 dm<sup>3</sup>/kg were produced from industrial kraft pulp (softwood) by oxygen bleaching following pretreatment with 2% NO<sub>2</sub>. After treatment with NO<sub>2</sub> at 12% consistency without oxygen addition at modest temperature, the pulp was diluted with acid sodium nitrate solution to 5% consistency and kept at high temperature for 90-180 min in stage 2. The generation of NO<sub>2</sub> from HNO<sub>3</sub> is a most important reaction in this stage. Reactions between HNO<sub>3</sub> and the lignin explain the effects of dilution, temperature and oxygen addition. (Edited author abstract) 8 refs.

**086977 ORGANOSOLV PULPING - METHODS AND PULP PROPERTIES.** Potential benefits of using organic solvents for the delignification of lignocellulosic materials are discussed. Main characteristics of organosolv pulping methods published in the literature are presented and softwood pulp yields and strengths are compared with corresponding values of Kraft and sulphite pulps. Yields of organosolv softwood pulps can be higher than yields of conventional pulps at equal kappa number. Tensile and tear strengths of softwood organosolv pulps fall between the corresponding values of Kraft and sulphite pulps. The published data shows that organosolv pulping methods have considerable potential in terms of delignification selectivity and papermaking quality. It is postulated that a more systematic research to reveal the relationships between the physical and chemical characteristics of organosolv fibres and pulp quality is needed so that the pulping methods can be modified and the full potential of organosolv processes utilized. (Author abstract) 143 refs.

**086979 ANALYSIS OF A PART OF THE RECOVERY SYSTEM OF THE SULFATE PULP PROCESS.** A system analysis has been performed on a part of the chemical recovery system of the sulfate pulp process. This part begins with the smelt from the recovery boiler and ends with white liquor ready to use in the pulp digester. The analysis can be divided into three parts. In the first part the status of the present process was investigated. In the second part the principle design of the process of tomorrow was evaluated. Finally, in the third part the role of the returned lime and the produced lime mud were investigated. (Edited author abstract) 25 refs.

**086980 REPAP'S ALCELL PROCESS: HOW IT WORKS AND WHAT IT OFFERS.** According to Repap, the Alcell pulp can be bleached to 90 ISO and the only effluent from the pulping process has a BOD content that is easily treated. Capital costs for a fully-commercial system would be low compared with a kraft mill because it does not require a recovery boiler, brownstock washer or a lime cycle. Production costs in an Alcell mill would be 85% of those in a kraft mill. By selling the lignin recovered a producer could further reduce costs.

Williamson, Peter N. (Pulp & Paper Canada, Don Mills, Ont., Can.). *Pulp Pap Can* v 88 n 12 Dec 1987 p 47-49.

**086981 ALCELL OFFERS SAVINGS WITH QUALITY PULPS, BY-PRODUCTS.** By using alcohol, Alcell eliminates odors and other environmental problems, normally associated with kraft pulping. Alcell pulps from hardwood are stronger than sulfite pulps, superior to TMP and comparable in strength to kraft pulp. Paper-making trials have shown that hardwood Alcell pulps can replace hardwood kraft pulp in furnishes that rely on softwood for their strength.

Pye, Kendall (Repap Technologies). *PIMA Mag* v 69 n 11 Nov 1987 p 21-23.

**086982 REVIEW OF THE PRODUCTION AND PROPERTIES OF ALPHABET PULPS.** The proliferation in recent years of new types of mechanical pulps which use mechanical energy and chemicals to transform wood chips to fibers has led to the popular term alphabet pulps. Each process has been assigned an alphanumeric designation to describe and distinguish it from others. This paper provides a general account of the history and rationale behind their developments and attempts to define and characterize the various processes and products in this spectrum and how they relate to the manufacture and printing properties of newsprint. (Author abstract) 29 refs.

**086983 FORMATION OF ISOEUGENOL AND EUGENOL DURING THE CLEAVAGE OF  $\beta$ -ARYL ETHERS IN LIGNIN BY ALCOHOL-BISULFITE TREATMENT.** Treatment of guaiacylglycerol- and guaiacylpropanediol- $\beta$ -(2-methoxyphenyl) ethers at 160°C in 50% alcohol containing magnesium bisulfite was found to cleave the  $\beta$ -aryl ether linkages in these compounds to form isoeugenol and/or eugenol in up to 60% yield as well as comparable yields of guaiacol. The linkage in a nonphenolic model was not cleaved to a discernible extent. Both an alcohol and bisulfite were essential for this reductive cleavage which proceeded efficiently in ethanol and isopropanol but not efficiently in methanol, t-butanol or dioxane. Magnesium was a better base than sodium for the reaction. Ferriyl alcohol was proposed to be an intermediate compound of this cleavage reaction which reasonably explains the formation of isoeugenol and eugenol from wood during the alcohol bisulfite pulping process. (Author abstract) 20 refs.

**086984 APPROACH TO MACERATION MECHANISM IN ENZYMATIC PULPING OF BAST FIBERS BY ALKALOPHILIC PECTINOLYTIC ENZYMES PRODUCED BY ERWINIA SPECIES.** Tissue maceration was generally elucidated by the action of endopolygalacturonase and endo-pectate or -pectin lyase (endo-PAL or -PNL). In a process of screening of *Erwinia* and *Pseudomonas* strains for enzymatic pulping of pectocellulosic bast fibers, it was found that their PAL productivity was not completely related with defibrillation activity, i.e., the fact that an *E.chrysanthemi* strain showed high PAL productivity but possessed rather low defibrillation activity. Moreover, defibrillation activity was parallel to the amount of neutral sugars released during pulping. Based on these facts, the maceration or enzymatic pulping of basts was estimated to proceed not only by cleavage of interfiber bonding caused by PAL action but also other factors. Among three possibilities proposed on the maceration mechanism of basts, it was elucidated by a concerted action of PAL and PNL with an aid of xylanase. In addition, a quantitative determinative method of maceration activity toward basts was also presented. (Author abstract) 25 refs.

**086985 ORGANOSOLV DELIGNIFICATION OF SOUTHERN PINE - AN ALTERNATIVE PULPING PROCESS.** Aqueous ethylenediamine-ethanol-anthraquinone (EDA-EtOH-AQ) pulping of Southern Yellow Pine was studied for lignin removal and pulp yield. Temperature, time and ethylenediamine concentration in the solvent solution were studied and equations for lignin content and lignin-free yield were developed. Lignin content is decreased by an increase of temperature, time or EDA concentration. Lignin-free yield of pulp decreased with an increase in temperature or time, but increased with increasing EDA concentration. Overall, the solvent is selective, that is, large quantities of lignin are removed while the retention of cellulose remains high. (Author abstract) 9 refs.

**086988 EFFECT OF GRAFTING ON THE PAPER PROPERTIES OF WOOD PULP.** Acrylate monomers (such as methyl, ethyl, butyl, and epoxypoly) were grafted onto chemithermomechanical pulps (aspen) by using the xanthate method of grafting. The grafted pulps and the mixture of grafted and nongrafted pulps were

formed in sheets that were hot pressed. The properties of the paper sheets of the resulting pulps - dimensional stability, porosity, water retention value, breaking length at dry and wet states, folding tension, tear and burst indices, elongation, energy, and Young's modulus were evaluated. Most of the paper properties deteriorated as a result of the grafting of hydrophobic monomers. But a special treatment, such as using acetone with grafted fibers, showed a positive effect over the nongrafted fibers. (Author abstract). 15 Refs.

Bioconversion See Also WOOD—Decay.

**086989 BIOLOGICAL TREATMENTS OF PULPS.** This is a brief review which highlights the current research on applications of biotechnology to the upgrading of unbleached kraft and mechanical pulps. The potential applications include biological beating, biological treatment for dissolving pulp, and biological bleaching and brightening of pulps. The use of fungi and the enzymes cellulase, xylanase, and glucose oxidase for biological treatment of pulps is discussed. (Edited author abstract). 14 Refs.

Jurasek, L. (Pulp & Paper Research Inst of Canada, Pointe Claire, Que, Can); Paice, M.G. *Biomass* v 15 n 2 1988 p 103-108.

**086990 RECENT DEVELOPMENTS IN BIOTECHNOLOGY IN THE PULP AND PAPER INDUSTRY.** Biotechnology implies a technical utilization of biological processes. One of the most important biological processes in nature is the conversion of lignocellulosic materials (wood, straw, bagasse, etc.) to carbon dioxide, water and humic substances. The strategy at STFI has been to develop and achieve a thorough knowledge of the enzyme mechanisms employed by the white-rotters, particularly *Phanerochaete chrysosporium* (Syn. *Sporotrichum pulverulentum*) for the degradation of wood and wood components. Such basic knowledge now exists and forms a reasonably well established base for our biotechnical process developments. Two examples of biotechnical process developments for the forest industries are presented; one, biological pulping and delignification, entirely based on white-rot fungi and mutants thereof; and the other, purification of waste bleach waters, based on a mixture of fungi able to live on the organic materials in such waters. (Edited author abstract).

Eriksson, Karl-Erik (Swedish Pulp & Paper Research Inst, Stockholm, Sweden). *Biomass* v 15 n 2 1988 p 117-119.

**086991 IMPLICATIONS OF BIOTECHNOLOGY IN THE PULP AND PAPER INDUSTRY FROM THE MANAGEMENT PERSPECTIVE.** Biotechnology can be applied in both the manufacture of pulp and the treatment of the waste products produced. Some of the topics discussed are the selection of fungi for lignin degradation; bleaching water treatment; and water pollution control. The management aspects are also discussed. 4 Refs.

Koning, John (Univ of Wisconsin, Madison, WI, USA). *Biomass* v 15 n 2 1988 p 127-131.

## Biopulping

**086992 FUNGAL PRETREATMENT OF ASPEN CHIPS IMPROVES STRENGTH OF REFINER MECHANICAL PULP.** Pretreatment of wood chips with lignin-degrading fungi can improve the strength properties of unbleached refiner mechanical pulps. We studied the effect of two white-rot fungi (*Phanerochaete chrysosporium* and *Dichomitus squalens*) prior to refiner mechanical pulping. Strength and optical properties were compared in handsheets prepared from mechanical pulp of treated and untreated wood chips. Both fungal pretreatments resulted in handsheet strength properties better than the control when compared at an equivalent freeness. Fungal pretreatment decreased brightness and light-scattering.

tering coefficients but did not adversely affect opacity. Brightness of fungus-pretreated pulps was restored to that of the control by use of hydrogen peroxide bleaching. Lignin content of the chips was reduced by the fungal pretreatments. (Author abstract) 32 refs.

**Bleaching** See Also CELLULOSE—Viscosity; LIGNIN—Nitration; PAPER AND PULP MILLS—Effluents; PAPER AND PULP MILLS—Optimization; PULP—Kraft; PULP—Sulfite; PULP—Thermomechanical.

**086993 BENEFITS OF BETTER MIXING.** The importance of better mixing and of measuring mixing efficiency in industrial chlorine dioxide bleaching is discussed. The conclusions are based on mill-scale measurements on tower and high intensity mixers and computer simulations. The computer is based on kinetic equations for chlorine dioxide bleaching. Brightness, shive content and chlorine dioxide consumption is affected by the width as well as the shape of the chlorine dioxide distribution. (Author abstract) 12 refs.

Backlund, B. (STFI, Stockholm, Swed); Bergnor, E.; Sandstrom, P.; Teder, A. *Pulp Pap Can* v 88 n 8 Aug 1987 p 62-68.

**086994 IMPACT OF THE CHLORINATION STAGE IN SHORTENED SEQUENCES.** The influence of chemical charge on bleachability and the potential for shortening sequences was investigated for softwood kraft pulps. An increase in the chlorination stage charge results in a lowering of the CE Kappa Number and an increase in the CE brightness. This, in turn, reduces the chlorine dioxide demand of the pulp necessary to reach a given final brightness. A benefit in brightness with added caustic in an E<sub>0</sub> stage as well as the opportunity for bleaching to high brightnesses in as few as three stages are also described. (Author abstract) 12 refs.

Kronis, J.D. (C-I-L Research Cent, Mississauga, Ont, Can); Young, J.J. *J Pulp Pap Sci* v 13 n 5 Sep 1987 p 135-144.

**086995 INTERSTAGE PEROXIDE BLEACHING-DERESINATION OF THERMOMECHANICAL PULP.** A novel process is proposed for the concurrent peroxide bleaching and deresination of refiner pulps in the interstage mode. Pilot scale trials of the process with a softwood TMP showed that the brightness gain, measured after secondary refining, was about equal to that achieved in conventional post-secondary peroxide bleaching. More than 50% of hexane-soluble extractives, including free fatty and resin acids, were removed by the interstage treatment. Tensile strength of interstage bleached TMP after secondary refining was 27% higher than that of unbleached control pulp and 22% higher than that of post-secondary bleached pulp at the same total specific refining energy. (Author abstract) 5 refs.

**086996 REACTION KINETICS IN OXYGEN BLEACHING.** The oxygen bleaching of wood pulp takes in an heterogeneous system involving oxygen (Gas), water (liquid), and fiber (solid). Inconsistent effects of process variables (reaction temperature, alkali concentration, and oxygen pressure) on the overall oxygen delignification rate of wood pulp in various reacting systems have been reported in the literature. An apparent intrinsic reaction rate model, excluding the interphase mass transfer effects, has been developed based on oxygen bleaching experiments in an agitated and ultralow-consistency (solids content) reactor. The apparent intrinsic reaction rate model shows a faster delignification rate than those reported in the literature. (Edited author abstract) 25 refs.

Hsu, C.L. (Georgia Inst of Technology, Atlanta, GA, USA); Hsieh, J.S. *AIChE J* v 34 n 1 Jan 1988 p 116-122.

**086997 COMPARISON BETWEEN BLEACHING SEQUENCES WITH ALKALINE EXTRACTION IN THE PRESENCE OF OXIDIZING AGENTS.** Sulfate pulp was bleached by CEH, CED and CEDED sequences, with a low charge of chlorine followed by an oxidative extraction stage, using either hydrogen peroxide or oxygen. Pulp and alkaline effluents resulting from the different procedures were evaluated and compared. E/P filtrate was less colored, but no other improvement in quality was detected. The bleached pulps showed similar values for brightness and strength. SEM revealed fiber damage to occur in E O, but without effect upon macroscopic properties. (Author abstract) 10 refs.

**086998 OXYGEN-BLEACHING PRACTICES AND BENEFITS: AN OVERVIEW.** Oxygen bleaching or delignification was developed as a commercially feasible process during the late 1960s and early 1970s in Sweden and South Africa. The use of oxygen delignification systems is increasing throughout the world. Experience has shown these systems can be used successfully to delignify kraft softwood and hardwood pulps, sulfite softwood and hardwood pulps, and specialty pulps. Oxygen-bleached pulps are used in a wide variety of products, including newsprint and writing papers, copy paper, grease proof paper, paper board, tissue, and diapers. The discharge of bleach plant pollutants and the operating cost of bleaching are reduced by use of an oxygen delignification system. The technology is compatible with new developments aimed at reducing the discharge of bleach plant effluents, such as extended delignification, NO<sub>2</sub> pretreatment, and ozone and peroxide bleaching. Oxygen delignification is expected to play a major role in the industry's efforts to develop an effluent-free bleached pulp mill. A list of oxygen delignification installations worldwide is presented here, and the experience gained to date is summarized. 12 refs.

**086999 BLEACHING AND BRIGHTNESS STABILIZATION OF HIGH-YIELD PULPS BY SULFUR-CONTAINING COMPOUNDS.** The stabilization against photo-induced discoloration of high-yield unbleached and peroxide-bleached chemimechanical pulps was studied. Various organic sulfur compounds initially bleached the pulps and subsequently retarded yellowing. The stabilizing activity of the sulfur compounds is strongly influenced by molecular structure. Particular thiols, such as 1-thioglycerol and glycol dimercaptoacetate, provided both bleaching and stabilization effects, whereas thioethers generally exhibited only a stabilizing action. Disulfides, sulfoxides, and sulfones were ineffective additives. (Author abstract) 10 refs.

**087000 LABORATORY STUDIES OF CHLOROFORM FORMATION IN PULP BLEACHING.** The effects of C-, E-, and H-stage bleaching parameters on chloroform production were studied in the laboratory for both softwood and hardwood kraft pulps. D-stage chloroform production was found to be minimal. The H stage is by far the largest chloroform producer (about 5-15 times the C, E, and D stages combined). The magnitude of the hypochlorite charge is the dominant factor affecting the amount of chloroform produced in the H stage. Although it is normally small, the C-stage chloroform production increases at a high temperature. Besides the C-stage temperature, C-stage chlorine charge and C-stage chlorine dioxide substitution are the primary factors affecting C- and E-stage chloroform production, which increases with the charge and decreases with the substitution. (Author abstract) 4 refs.

**087001 RECOMMENDED METHOD FOR DESIGNATING BLEACHING STAGES.** The practice of designating bleaching stages and sequences using a symbolic shorthand has evolved through the years. Variations, combinations, and complexity in bleaching practices, however, coupled with variations in symbolism, have caused misunderstanding and errors regarding bleaching practices. This ambiguity has created the need for a common method of designating pulp bleaching stages. This paper gives recommendations to establish a coherent method for representing bleach plant stages and sequences. To facilitate clarity in communication, industry-wide adherence to these guidelines is urged.

**087002 DISSOLVING PULPS FROM WHEAT STRAW BY SODA-ANTHRAQUINONE PULPING.** Dissolving pulps are obtained by subjecting prehydrolyzed Egyptian wheat straw to soda-anthraquinone pulping. The pulps obtained are satisfactorily bleached by the CEH sequence, while in the absence of anthraquinone an additional chlorite step should be applied to raise the degree of whiteness. A very important effect of anthraquinone takes place in the fine structure of the pulp whereby it increases the affinities toward water and alkali, lowers the crystallinity, and results in considerable improvement in the reactivity toward xanthation. Soda-anthraquinone pulps with suitable  $\alpha$ -cellulose content can be obtained by using the appropriate concentration of acid in prehydrolysis to hydrolyze a greater amount of the lower molecular weight carbohydrates before the soda-anthraquinone pulping. (Author abstract) 24 refs.

**087003 ROLE OF SILICATE IN PEROXIDE BRIGHTENING OF MECHANICAL PULP. PART II: THE EFFECTS OF RETENTION TIME AND TEMPERATURE.** The effects of retention time and temperature on the ability of silicate to improve the peroxide brightening of black spruce groundwood pulp were examined. The conditions were carefully optimized for each set of conditions. It was found that the maximum brightness obtainable is highest at low temperatures with long retention times. The optimum alkalinity does not differ with temperature over the range 25°C to 90°C. The amount of silicate required does not change with temperature, however the benefit derived from using silicate does decrease with increasing temperature. (Author abstract) 15 refs.

**087004 COMMUNICATIONS TO THE EDITOR: VISCOSITY-ENHANCING BLEACHING OF HARDWOOD KRAFT PULP WITH XYLANASE FROM A CLONED GENE.** We have produced clones of *E. coli* capable of endoxylanase or  $\beta$ -xylosidase production in the absence of cellulase, which could find potential application in lignincarbohydrate cleavage, especially for hardwood kraft pulps where xylan is the predominant hemicellulose, and can even be redeposited on the pulp during cooking. We now describe experiments which demonstrate that lignin removal can, indeed, be aided by treatment with xylanase from a cloned system, and that the resulting pulp retains viscosity as well as the required strength properties. Fragments of DNA containing the structural genes were inserted into the EcoRI site of the expression vector pKK 233-3 (Pharmacia P.L. Biochemicals) to give new plasmids named pKK 223-200 and pKK 233-300 for the endoxylanase and  $\beta$ -xylosidase. The expression vector contains a combined trp-lac promoter and an ampicillin resistance gene. The recombinant plasmids were introduced by transformation into *E. coli*

JM105, a thiamine proline-less mutant. The new clones, in the presence of isopropyl- $\beta$ -D-thiogalactoside (IPTG) produced more enzyme than the originals. 15 refs.

**087005 DTPMPA: POLYAMINO POLYPHOSPHONIC ACID AND ITS USE IN PAPER PROCESSES. PART 1: THE CHEMISTRY OF PULP BLEACHING WITH DTPMPA AND ITS IMPACT ON FINES RETENTION.** The performance of DTPMPA (diethylene triamine penta-methylene phosphonic acid) has been evaluated in different pulp bleaching processes. As a result of the effective peroxide stabilization, high brightness can be achieved, and a great amount of residual peroxide can be maintained. The selective complexation of metal ions which catalyze the decomposition of hydrogen peroxide means that DTPMPA can be efficiently used in pretreatment. The advantage of silicate-free formulations extends beyond the bleaching stage and can be perceived in other stages of the papermaking process. Some specific problems caused by silicates are identified. Examples of incompatibility with cationic retention aids are given. (Author abstract) 8 refs.

**087006 OXYGEN BLEACHING FOLLOWING NO<sub>2</sub> TREATMENT BY A NEW PROCESS.** Oxygen bleaching of conventional kraft pulp after pretreatment with 2% NO<sub>2</sub> decreased the kappa number by 88% while maintaining a viscosity higher than that of most oxygen-bleached pulps produced industrially. After NO<sub>2</sub> treatment at high consistency and after dilution with weakly acidic sodium nitrate solution, which simulates spent liquor from the process, the pulp is ripened at a high temperature of around 90°C for 2 h. Generation of NO<sub>2</sub> from HNO<sub>3</sub> is a key reaction during ripening. (Author abstract) 8 refs.

Samuelson, Olof (Chalmers Univ of Technology, Goteborg, Swed); Ojteg, Urban. *Tappi J* v 71 n 6 Jun 1988 p 175-177.

**087007 OPTIMIZATION OF PEROXIDE BLEACHING SYSTEMS.** Process simulation was used to optimize peroxide bleaching systems including those with one and two stages with various recirculation strategies for bleaching mechanical pulps. When bleaching spruce to a high brightness of 80 percent ISO, savings of 6.50-7.00 dollars/o.d. metric ton of pulp can be made by installing a two-stage process compared to a one-stage process. All peroxide should be charged in the second stage, and peroxide filtrate is recycled to the first stage. Medium consistency in the first tower and high consistency in the second tower are recommended. (Author abstract).

## Chemical Reactions

**087010 OXIDATION OF MONOHYDRIC ALCOHOLS WITH ANTHRAQUINONE AND ITS DERIVATIVES UNDER SODA PULPING CONDITIONS.** Monohydric alcohols as models for cellulose were reacted with anthraquinone (AQ) and three of its alkali-soluble derivatives in 1M sodium hydroxide at 170°C. Cyclohexanol and cyclohexanemethanol were selected as soluble secondary and primary alcohols, respectively, and the steroidal alcohols, lithocholic acid and cholestan-3 $\beta$ -ol, as less soluble models. In every case the AQs oxidized the alcohols, although cyclohexanemethanol and the insoluble cholestanol were oxidized only to a minor extent with AQ after 6 h. The efficacy of oxidation by the quinones was in the order sodium AQ-2-sulfonate (AMS) > AQ-2-carboxylic acid > 2-hydroxy-AQ > AQ. (Author abstract) 11 refs.

**087011 BEHAVIOR OF LIGNIN IN ORGANIC ACID PULPING. II REACTION OF PHENYLCOUMARANS AND 1,2-DIARYL-1,3-PROPANEDIOLS WITH ACETIC ACID.** In order to explain the behavior of phenylcoumaran and 1,2-diaryl-1,3-propanediol structures in acetic acid pulping, their lignin model dimers in the presence of creosol as a lignin aromatic nucleus model were cooked in 90% acetic acid at 180°C. About 50% of phenolic phenylcoumaran was consumed during a 3-hour reaction to yield phenylcoumarone, a stilbene derivative and a condensation product; but the non-phenolic model was very stable and was recovered as an acetate. On the other hand, phenolic and non-phenolic 1,2-diaryl-1,3-propanediols were unstable and were degraded within 1 hour to give stilbene derivatives as main products together with diarylmethanes and condensation products. (Author abstract). 20 Refs.

Yasuda, Seiichi (Nagoya Univ, Nagoya, Jpn). *J Wood Chem Technol* v 8 n 2 1988 p 155-164.

**087012 CHARGE-TRANSFER COMPLEXES IN KRAFT LIGNIN PART I: OCCURRENCE.** Charge-transfer complexes were found to occur between kraft lignin and an added model quinone, 3,5-di-tert-butyl-1,2-benzoquinone. The occurrence of charge-transfer interactions was also apparent in an oxidized kraft lignin with an increased quinone content. In these systems, free phenolic groups within the lignin were considered the donor species and ortho-quinones the complementary acceptor moieties. Carbon-14 labeling revealed that the quinone content of the investigated kraft

lignin averaged 3%. These quinones were determined to have a molar absorptivity of 528 L/mol-cm. Upon sodium borohydride reduction of this lignin, only one-third of the absorbance decrease could be accounted for by this number of quinones. The remaining two-thirds of the decrease in absorbance was assigned to the disruption of charge-transfer complexes. The quinones, therefore, played a dual role as a chromophore by participating as acceptor species in these complexes. (Author abstract). 27 Refs.

Furman, G.S. (Inst of Paper Chemistry, Appleton, WI, USA); Lonsky, W.F.W. *J Wood Chem Technol* v 8 n 2 1988 p 165-189.

**087013 CHARGE-TRANSFER COMPLEXES IN KRAFT LIGNIN PART 2: CONTRIBUTION TO COLOR.** Chelation and removal of transition metals from the kraft lignin employed in this study did not reduce the lignin's visible absorbance. Likewise, hydrogenation of carbon-carbon double bonds in this lignin also had no effect on its visible spectrum. This indicated that extended conjugated systems were not a significant contributor to the color of this lignin. Of the structures investigated, quinones were found to be the major visible-light absorbing chromophores. Since a large component of the quinone's absorption results from their participation in charge-transfer complexes (CTCs), CTC's were a significant contributor to the color of this lignin. (Edited author abstract). 9 Refs.

**087014 WOOD CHIP REFINER CONTROL.** The authors treat the control of a chip refiner to produce wood pulp, where the incremental gain between the motor load and the plate gap is subject to sudden changes due to pad collapse. Passive adaptive control with fault detection, active suboptimal dual control, and dual-control solutions are discussed. For dual control, the choice of the control criterion is crucial, as it must reflect the peculiarities of the process. Two nonquadratic performance indices are proposed, and the myopic solutions are computed. Simulations show the superior performance offered by these indices. 11 refs.

## Cooking

**087015 CHEMI-MECHANICAL PULPING OF TAMARACK - PART I: EFFECTS OF CHIP COMPRESSION AND COLD WATER EXTRACTION.** Sodium sulfite cooks of tamarack chips were done to improve the strength properties of tamarack mechanical pulps. Chip compression by a plug screw feeder simplified the extractives' removal, increased the total ion content and significantly affected most of the sheet characteristics. Cold water extraction of chips prior to sulfonation influenced the total ion content and pulp yield but not the sheet properties. Tamarack CMP is low in brightness, about 33%. (Author abstract) 23 refs.

**087016 COOKING LIQUOR ANALYZER: A NEW TOOL FOR CONTROLLING A CONTINUOUS DIGESTER.** A recently developed cooking liquor analyzer was installed at a continuous Kamyr digester for monitoring trials to find new methods for improving quality control. The analyzer is based on a new sampling and measuring concept, where a set of concentration data of lignin, dry solids and residual alkali are produced every five minutes from different digester circulations. A cross-correlation was made of the data obtained with a carefully monitored Kappa No. of the pulp. Measured concentration and Kappa No. profiles, cross-correlation functions and the resultant cooking models are presented in this paper. (Author abstract) 4 refs.

**087017 STABILITY OF  $\alpha$ -ETHER TYPE MODEL COMPOUNDS DURING CHEMICAL PULPING PROCESSES.** In order to examine the stability of lignin-carbohydrate complexes (LCC) during alkaline chemical pulping, benzyl ether type LCC model compounds containing different non-phenolic units were synthesized and cooked under chemical pulping conditions. At least 80% of the starting substance was recovered unchanged, from soda, kraft and acid sulfite reactions indicating the benzyl ether linkage in this compound is stable during pulping. (Edited author abstract) 10 refs.

Taneda, H. (Univ of Tokyo, Tokyo, Jpn); Nakano, J.; Hosoya, S.; Chang, H.-M. *J Wood Chem Technol* v 7 n 4 Dec 1987 p 485-497.

**087018 ENHANCED CLEAVAGE OF  $\beta$ -ARYL ETHER BONDS IN LIGNIN MODEL COMPOUNDS DURING SULPHITE-ANTHRAQUINONE PULPING.** Under sulfite-anthraquinone (AQ) cooking conditions reduce anthraquinones, such as anthrahydroquinone or oxanthrone, promote cleavage of the  $\beta$ -ether bond in the free phenolic  $\beta$ -ether lignin model 1. This enhanced cleavage, and the products formed, can be rationalized by a mechanism involving formation of an adduct between the reduced quinone and the quinone methide 3. This adduct then fragments to afford the observed products. Wood sugars are capable of reducing AQ to the catalytically active form during sulfite-AQ cooling. Consequently, AQ can catalyze the cleavage of free phenolic  $\beta$ -aryl ether linkages in lignin when sugars are present. This finding explains why AQ is able to accelerate delignification during the initial phase of sulfite-AQ pulping. However, it does not provide the full story since it cannot explain why AQ catalyzes delignification during the bulk phase of sulfite-AQ pulping. (Edited author abstract) 27 refs.

**087021 KRAFT PULPING OF CRUSHED HARDWOOD CHIPS.** A 220 t/d crusher for pulpwood chips has been developed which is capable of controlling effective chip thickness by chip shearing followed by chip crushing. The benefits from using these treated chips are reduced pulp reject levels and reduced alkali charge requirements for kraft pulping. This chip crusher is described along with the results of laboratory pulping studies on crushed hardwood chips. Mill trials are briefly covered. (Author abstract) 13 refs.

**087022 PHYSICAL DISTRIBUTION OF RESIN IN BLEACHED KRAFT PULP MILLS.** Quantities of resin dissolved, dispersed and attached to fibers were measured in pulp samples at various locations along the process streams of six fully bleached kraft pulp mills. Data were collected during periods of routine operation and provide a reference for future problem-solving during periods of rapid pitch deposition. Because the resin tends to be mostly attached to the fibers at low pH, the alkaline washers are the most effective points of pulp deresination. (Author abstract) 20 refs.

Allen, L.H. (Paprican, Pointe Claire, Que, Can); Lapointe, C.L. *Pulp Pap Can* v 88 n 12 Dec 1987 p 231-232, 234-239.

**087023 PROCESS CHEMISTRY AND CONTROL OF RAPID-DISPLACEMENT HEATING.** The rebirth of kraft batch cooking has become a reality. The modified batch processes combine the versatility of batch-type operation and improved heat economy. High-quality kraft pulp can be produced by a batch-digester house with the following advantages: Sixty percent less primary heat consumption; First washing stage in the digester; Extended delignification; Improved strength, with up to 15% more tear index. These benefits are achieved by arranging the digester design and cooking cycle so that the heat of an individual cook can be recovered and used in subsequent cooks. The upper-level digester-house management system is the crucial tool for maintaining and optimizing operation of the digester house. 14 refs.

**087024 FLASH X-RAY IMAGING OF KRAFT BLACK LIQUOR SPRAYS.** The requirements for an optimal black liquor spraying system are unique among combustion processes with respect to the high flow rates and the large droplet sizes required. The study of such large and coarse sprays is difficult via usual optical

imaging techniques. Flash X-ray radiography (FXR) is a unique and powerful tool for studying high speed, multiphase flows in general and kraft black liquor sprays in particular. This imaging technique is applicable to the problem of kraft black liquor sprays. (Author abstract) 12 refs.

Farrington, Theodore E. Jr. (Inst of Paper Chemistry, Appleton, WI, USA). *Tappi J* v 71 n 2 Feb 1988 p 89-92.

**087025 BUILDING A MECHANISTIC MODEL OF KRAFT-ANTHRAQUINONE PULPING KINETICS.** A study of kraft-anthraquinone pulping kinetics was conducted to develop a mechanistic model valid over the bulk and residual phases. A competitive sequential experimental design criterion was used to choose conditions for each pulping run. Iterations of experiment, data analysis, and choice of new experimental conditions were used to discriminate among candidate models and to obtain precise parameter estimates for the best models. The best delignification model incorporated three parallel pathways for lignin solubilization, a lignin condensation pathway, and a residual delignification pathway in which the condensed lignin is dissolved. The best models for dissolution of cellulose, glucomannan, and xylan were composed of two parallel pathways for peeling, two for stopping and one for chain cleavage. (Author abstract) 5 refs.

**087026 MULTIVALENT ION REMOVAL FROM KRAFT BLACK LIQUOR BY ULTRAFILTRATION.** Kraft black liquor (KBL) was ultrafiltered into permeate and retentate fractions. Whereas Na and K were concentrated in permeate solids, many higher valence ions were disproportionately found in retentate solids. Those elements concentrated include Ca, Mg, Al, and Fe. Si was less dependably retained. The retentate/permeate ratio of Ca, based on dry solids, was as little as 1.6 for a low-Ca northern softwood KBL and as high as 7.6 for a high-Ca southern hardwood KBL. Polysulfone ultrafiltration (UF) membranes of 50,000 molecular weight cutoff (MWCO) concentrated multivalent elements to a lesser extent than did 6000 or 20,000 MWCO membranes. (Edited author abstract) 9 refs.

**087027 KRAFT PULPING STUDIES ON SESBANIA ACULEATA - THE OVER-ALL REACTION PATTERN.** The aim of the present investigation is to study more the factors that influence delignification in kraft pulping, such as chip size, effective alkali charge, sulphidity and temperature of cooking than the basic mechanism itself. The possibility of using Sesbania aculeata as a raw material for the paper industry has been examined by studying the essential properties such as density, delignification rate, beatability, bleachability and pulp yield. The results have shown that Sesbania aculeata has all these properties. (Edited author abstract) 12 refs.

Upadhyaya, J.S. (Univ of Roorkee, Saharanpur, India); Singh, Sunder Pal. *Res Ind* v 32 n 3 Sep 1987 p 148-159.

**087028 ROLE OF DIFFUSION DURING INITIAL DELIGNIFICATION OF ALKALINE PULPING.** The delignification curve for the earliest stage of alkaline pulping is predicated well by unsteady-state diffusion theory. The predicted lignin diffusivities are higher than those obtained from lignin leaching studies because the initial lignin has a low molecular weight. A large increase in diffusivity with temperature is explained on the basis of the increase in cell wall permeability with temperature and the possible reduction in lignin molecular weight with increase pulping temperature. The increase in the initial

delignification rate with the addition of sulfide is also attributed to a reduction in lignin molecular weight under kraft pulping conditions. (Author abstract) 13 refs.

**087029 VAPORIZATION FROM ALKALI CARBONATE MELTS WITH REFERENCE TO THE KRAFT RECOVERY FURNACE.** This paper examines the processes responsible for fume generation in the kraft furnace. Fume generation under oxidizing conditions was found to be an order of magnitude greater than under strongly reducing conditions. Addition of sodium hydroxide to the sodium carbonate-sulphide melt did not increase the fuming rate. Potassium and chloride levels in kraft furnace fume are lower than values calculated from equilibrium data; however, if the enhanced vaporization of sodium due to oxidizing conditions is taken into consideration, the low potassium and chloride levels in the fume can be explained. Raoult's law gives an accurate description of sodium chloride vaporization from a sodium carbonate-sulphide-chloride smelt under oxidizing conditions. (Author abstract). 13 Refs.

Cameron, J.H. (Inst of Paper Chemistry, Appleton, WI, USA). *J Pulp Pap Sci* v 14 n 4 Jul 1988 p 76-81.

**087030 ACID-SOLUBLE AND ACID-SOLUBLE LIGNIN CHARACTERISTICS IN KRAFT PULPING OF HYBRID SALIX CLONES.** The recombining characteristics of the Salix species, the possibility of rapid genetic improvement, clonal propagation, relatively short rotations, and the relative uniformity of the physical properties of the trees make selected hybrids of this species attractive for study. In our study, we characterized pulping properties among clones from different species and within species, using current shoots from stools that were one year old in 1982. Thirteen young clones from within and between species were used in the study. Three other Salix clones, 14 years old, were also included for additional comparisons. The apparent activation energy for kraft pulping of wood from different hybrid Salix clones ranges from 98 to 120 kJ/mol. The average activation energy is less than reported for species such as Eucalyptus regnans, revealing it as an ideal species for pulping. Acid-insoluble and acid-soluble lignin contents in pulp are strongly related to percent delignification; the relationship could be fitted by a second-order polynomial. 8 Refs.

## Materials

**087032 MINERALS IN PAPER. A QUALITY PARADOX.** A paper made entirely from fibers will be strong but is likely to be porous and have a rough surface, making it not very suitable for quality printing. Filler materials, especially minerals, have been found to reduce the porosity and roughness and improve the printability of printing and writing papers. The subsequent coating of paper with pigmented mixes brings about an equivalent quality improvement with typical coated papers having an inorganic content of one-third. Since the commonly used minerals are one-quarter of the cost of fiber there is a definite incentive for papermills to aim for maximum mineral contents. (Edited author abstract)

McConnell, David (Bowaters UK Paper Co). *Ind Miner (London)* v 247 Apr 1988 p 155, 157.

## Mathematical Models

**087033 MODELLING OF BATCH KRAFT PULPING AND OF KAMYR DIGESTERS.** A mechanistic model has been developed that predicts with high accuracy the batch Kraft pulping of both hardwoods and softwoods. This model has then been adapted to a Kamyr digester. It predicts: pulp yields; Kappa numbers; dissolution of lignin, cellulose, and hemicellulose; and both caustic and sulfide consumption during both steady state operation and hardwood-softwood swings. (Author abstract) 16 refs.

**Optimization** See Also PAPERMAKING—Computer Simulation.

**087034 PROCESS OPTIMIZATION OF SODA-ANTHRAQUINONE PULPING OF DATE-PALM LEAVES.** The results of a second order regression analysis of the objective function (screened pulp yield) and the equality constraint (the Kappa No., indirect measure of lignin), produced equations which adequately described the behaviour of the process through the region studied. Three optimization methods were adopted and used to find the process conditions which could maximize the screened pulp yield at various levels of lignin content within definite ranges of the process conditions. The screened yield showed a maximum with the four variables mentioned. The results of optimization were later verified by performing experiments under the obtained optimum conditions. (Edited author abstract). 13 Refs.

## Reaction Kinetics

**087036 COMPRESSIVE ENERGY ABSORPTION IN THE PULPING KINETICS OF WHITE PINE: THE SHRINKING CORE MODEL.** Cylindrical rods 2.5 cm in diameter were kraft pulped with and without anthraquinone at 143°C with 46 g/L NaOH and liquor of 25 percent sulfidity. Samples were analyzed for lignin content. Compressive energy absorption (CEA) was measured as a function of radial position and time. As measured by CEA, the strength could be phenomenologically explained by a shrinking core model during the initial period. The lignin content, however, did not substantially decrease during this time. The strength-reducing reactions occur before significant delignification occurs, and these reactions follow a shrinking core model. (Author abstract). 5 Refs.

**Refining** See Also PAPER AND PULP MILLS—Control Systems; PAPERMAKING MACHINERY—Design; PULP—Mechanical; PULP—Thermomechanical.

**087037 EFFECT OF REFINING PARAMETERS ON PAPER PROPERTIES.** A mathematical formula that describes the mechanism of refining is being used in paper-mills to improve product quality and cut manufacturing costs. The formula defines the number of impacts received by a fiber and the severity of those impacts, and optimum refining depends on getting the formula right for a given type of fiber - the number of impacts and their severity varies from fiber to fiber and from end product to end product. With too much refining, a weak fiber can be damaged, but with too little, a strong fiber will not be developed properly. The formula quantifies operating variables and relates them mathematically, and this can optimise virtually any refining situation. (Edited author abstract)

Danforth, Donald W. *Pap Technol Ind* v 28 n 5 Aug 1987 p 547-548, 550, 553.

**087038 WEAR CHARACTERISTICS OF REFINER PLATES.** Wear patterns were studied on used refiner plates from Canadian RMP, TMP and CTMP mills. Samples of both cast iron and cast stainless steel plates were examined. Bar rounding, clashing, and erosion (due to cavitation and/or liquid droplet impingement) were the most commonly observed wear patterns. (Edited author abstract) 18 refs.

Thompson, C.B. (PAPRICAN, Pointe Claire, Que, Can); Garner, A. *Pulp Pap Can* v 88 n 8 Aug 1987 p 80-83.

**087039 ABRASIVE REFINER PLATES FOR THE PRODUCTION OF MECHANICAL PULP.** It is possible to produce mechanical pulp with a newly developed abrasive plate on an industrial refiner. The abrasive plates were mounted on the stationary disc of a second-stage 42-1B Sprout Waldron refiner. When these plates were run against appropriate conventional plates mounted on the rotating disc, an extremely clean pulp was produced having a freeness of about 60 mL using a total specific energy of 6.8 GJ/metric ton. The pulp has a higher scattering coefficient and tensile strength but a lower tear strength than newsprint pulp produced on a conventional two-stage TMP system. There was no measurable loss of abrasive material during trials lasting approximately 7 h. (Author abstract) 7 refs.

**087040 USING THE REFINING PROCESS TO ENGINEER PULP PROPERTIES.** A refiner leaves its fingerprint on a pulp, and, as a result, single disc and double disc refiners produce pulps with different properties. Single disc pulp has superior web strength and dry tear strength due to its long-fibre content. But double disc pulp, with more fines and less long fibre, has higher apparent density and light scattering coefficient. The latest refining technology enables a mill to combine double disc and single disc refining to engineer the pulp for value-added grades. This technology is available at an economic price because the major components of the two refiners are identical. (Author abstract)

Jackson, M. (Sunds Defibrator); Ferrari, B.; Falk, Bo; Danielsson, O. *Pap Technol Ind* v 28 n 7 Oct 1987 p 661-667.

**087041 APPLYING HYDRODYNAMIC LUBRICATION THEORY TO PREDICT REFINER BEHAVIOUR.** Hydrodynamic lubrication theory has been used to relate the physical dimensions of bar surfaces in a mechanical pulp refiner to the plate-to-plate gap, refiner closing force, and motor load. The theory predicts the observed insensitivity of refining to the rounding of

leading edges on bars and shows the effect of bar height wear on closing force. The refiner's tolerance of tram variations is also predicted. (Author abstract) 15 refs.

**087042 COMMERCIAL SYSTEM FOR THE CHEMI-MECHANICAL TREATMENT OF STONE GROUNDWOOD REJECTS (CTMP).** The paper describes a commercial system for the mild sulfonation of stone groundwood rejects prior to rejects refining. In the freeness range 100 to 110 mL CSF, the resulting refined rejects exhibit a Somerville shive content of 0.05 to 0.10%, a tensile index of 50 to 55 Nm/g and a brightness gain from 58% to 63% ISO brightness. Overall results on the final pulp showed a significant reduction in shive content, a 10 to 15% improvement in strength properties and a two-point gain in brightness level. (Author abstract)

Jackson, M. (Sunds Defibrator Ltd, Vancouver, BC, Can); Engstrom, B.; Rosander, E. *Pulp Pap Can* v 88 n 12 Dec 1987 p 201-204, 206.

**087043 RESISTANCE OF REFINER PLATE ALLOYS TO BAR ROUNDING.** Bar rounding takes place by a form of slurry abrasion, resulting from sand and grit entrained in the pulp. The influence of refiner plate metallurgy on this type of wear is examined in this work. A test rig for laboratory wear has been constructed that reproduces the slurry abrasion wear mechanism on the bar edges of refiner plates. Based on results for a typical selection of commercial refiner plate alloys, the test rig consistently ranked the materials in an order that correlated with field experience. For all the alloys tested, abrasive wear in white water was dependent upon both corrosion and abrasion resistance. In these environments, the low-alloy cast iron had the lowest wear resistance. The martensitic, stainless steel Alloy 6, and the high-chromium, cast-iron Alloys 2 and 4 had the highest wear resistance. 24 refs.

#### Screening See Also PULP MATERIALS—Wood.

**087044 COMPARISON OF SLOTS AND HOLES IN THE SCREENING OF MECHANICAL PULP.** A high efficiency pressure screen has been evaluated to compare the performance screening mechanical pulp with slots and holes. The slots had lower capacity, freeness drop and fractionation. Removal of all sizes of shives, down to the smallest optically measurable was significantly superior with slots than with holes, or with centrifugal cleaners. Sheet strength and quality were higher with the slots. (Author abstract) 5 refs.

Hooper, A.W. (S.W. Hooper & Co, Montreal, Que, Can). *Pulp Pap Can* v 88 n 10 Oct 1987 p 57-62, 65.

**087045 IMPROVED OPERATION OF TMP PLANT THROUGH OPTIMIZATION OF SCREENING.** Compared to the screening of chemical and groundwood pulp, the technology in the screening of TMP is still rather young and potential for great improvement exists. Profile-style screen cylinders with slots have outperformed standard drilled cylinders in almost every respect. As a secondary effect on improved screening performance, shive concentration and thickening of rejects has greatly improved the efficiency in reject refining. (Author abstract) 6 refs.

#### Sulfite Process

**087046 EXPERIENCE FROM HYDROSTATIC MEDIUM-CONSISTENCY OXYGEN DELIGNIFICATION AT RAUMA PULP MILL.** Since 1983 Rauma pulp mill has been operating a hydrostatic brown stock oxygen delignification system. This article describes the

operating history of the plant from its commissioning up until late 1985. The target delignification level of 50 to 55% was easily attained right from the start. The original concept has since been modified, the main objective being to develop a totally new control strategy and to improve stock pumping and oxygen mixing. In addition to the description of the oxygen stage itself, its implications elsewhere in the mill are discussed. (Edited author abstract) 3 refs.

**087048 UTILIZATION OF BUDWORM-KILLED WOOD IN SULPHITE PULPING.** Stora Forest Industries, formerly Nova Scotia Forest Industries, has operated both market sulphite and newsprint mills before, during and after the budworm epidemic. Large quantities of budworm-killed spruce and fir were used in the market pulp operation but not for manufacturing groundwood. Trends in sulphite pulp processing and quality resulting from the use of budworm-killed wood are described. (Author abstract) 17 refs.

Wilson, G.G. (Stora Forest Industries, Port Hawkesbury, NS, Can); Johnston, D.W. *Pulp Pap Can* v 88 n 10 Oct 1987 p 70-73.

**087049 DEVELOPING NEW METHODOLOGY TO DETERMINE CHANGES TO THE LIGNIN MACROMOLECULE DURING DELIGNIFICATION.** It was observed that, during the early stages of lignin removal (<40%), only lignosulfonates of low molecular weight (paucidisperse) were solubilized. These substances are the so-called hemilignins. In an attempt to identify these materials, we evaluated different methods for their isolation and characterization. We developed an approach to determine first the bonding environments of specific carbons in lignin in intact plant tissue. This was achieved by administering specifically labelled <sup>13</sup>C lignin precursors to growing intact plants over extended durations of time. It now appears possible to determine the changes in bonding patterns of specific carbons during lignin removal. This now allows us to examine the process of delignification in a much more rational manner. 6 refs.

**087050 ULTRA-HIGH-YIELD PULPING - PART VI: THE EFFECT OF SULFONATION ON THE DEVELOPMENT OF FIBRE PROPERTIES.** Mild sulfonation of Norway spruce chips followed by disc refining increases the amount of stiff poorly collapsed long fiber causing increased tear index but no increase in breaking length. Almost complete sulfonation followed by refining at a given specific energy produced chemimechanical pulp with higher breaking length and density than those of refiner mechanical and chemimechanical pulps produced from low sulfonate content chips. These results were due to the high breaking length of the long fiber fractions. The decrease in specific scattering and opacity that accompanied the increase in breaking length is due primarily to the loss of scattering of the medium and short fiber fractions. (Author abstract) 16 refs.

**087051 NEUTRAL SULFITE-ANTHRAQUINONE PULPING FOR LINERBOARD: A LOWER TEMPERATURE AND MILD ALKALINITY APPROACH.** A laboratory study of neutral sulfite-anthraquinone (NSAQ) pulping for linerboard has been conducted under lower temperature and milder alkaline conditions than usual. The wood furnish included eastern Canadian softwood and softwood-hardwood mixtures. Preliminary test results showed that NSAQ pulping at 165°C would be sufficient to produce a satisfactory linerboard-grade pulp. At a pulping time of 50 min, the process would provide a 20% higher pulping yield than the usual kraft process. The NSAQ pulp strengths were comparable to strengths of the kraft pulps. (Author abstract) 13 refs.

#### Sulfonation

**087052 CELL WALL SULFUR DISTRIBUTION IN SULFONATED SOUTHERN PINE LATEWOOD: VAPOR-PHASE COOKS.** The distribution of bound sulfur within the cell walls of sulfonated southern pine latewood chips has been studied experimentally. The effects of reaction time and Na<sub>2</sub>SO<sub>3</sub> concentration in the sulfonating liquor were studied in a 2 × 3 factorial experiment consisting of a series of vapor-phase cooks. Sulfur distributions were determined by scanning transmission electron microscopy with energy dispersive spectrometry. All treatments yielded a distribution characterized by a pronounced gradient of bound sulfur across the secondary wall. Sulfur counts decreased from a high value near the lumen to a minimum in the outer secondary wall and then increased toward a peak in the middle lamella. (Author abstract) 15 refs.

Heazel, T.E. (Inst of Paper Chemistry, Appleton, WI, USA); McDonough, T.J. *Tappi J* v 71 n 3 Mar 1988 p 129-133.

**087053 REJECTS SULFONATION.** The effect of sulfite charge, pulp consistency and treatment time on the sulfonation of TMP rejects or the long fiber fraction of the TMP furnish have been investigated. Properties such as sulfonate content, pulp yield, wet-web strength, dry sheet strength and optical properties are reported and discussed in terms of fiber properties for the process variables investigated. A flow diagram for rejects sulfonation is described and its basic features discussed. The benefits of rejects sulfonation for mechanical pulps are discussed by comparing properties of refined stone groundwood, thermomechanical and chemithermomechanical rejects with or without sulfonation. (Author abstract) 34 refs.

Barbe, M.C. (Hymac Ltd, Laval, Que, Can); MacDonald, J.E.; Cortez, L. *J Pulp Pap Sci* v 14 n 2 Mar 1988 p 28-36.

**087054 IMPROVING TMP PULP PROPERTIES BY SULFONATION: OPTIMIZATION OF SULFONATION PROCESS ALTERNATIVES.** Ultra-high yield pulps can be produced by modifying mechanical pulps through treatment with sodium sulfite. This sulfonation step can take place before refining the wood chips, between the first and second stages of refining, or in the rejects stream after screening but before refining the screen rejects. The sequence in which sulfonation, refining, and screening take place will affect the final pulp properties. Using the general energy and materials balance system (GEMS) a modular process simulation package, the authors studied the effects of sulfonation for several process configurations. A computer model was generated based on mill and laboratory data, and the computer found the configuration that would yield maximum savings. Additional study results are discussed. (Edited author abstract) 7 refs.

**087056 CHEMITHERMOMECHANICAL PULP FROM MIXED HIGH-DENSITY HARDWOODS.** To successfully utilize hardwood fibers in mechanical pulping, it is important to identify fundamental fiber characteristics that favorably influence paper properties and to understand how to best produce these pulps. Thus, the primary objective of our study was to determine the fundamental fiber features of CTMP from mixed, high-density hardwoods. The pulpwood was approximately 70 percent oak, 10 percent hickory, and 20 percent other high-density hardwood. Pulps with different fiber characteristics were produced by using different combinations of chemical, temperature, and pretreatment time. Chemical treatments were either alkaline sulfite or soda. The pulps were evaluated for fiber length distribution, fines content, specific surface area, specific volume, fiber strength, and fiber bonding indicators. Handsheets were tested for tensile strength, apparent density, and tear factor. 4 Refs.

## Washing

**087057 MODELLING THE FILTRATION STAGE OF A PULP WASHER.** The thickening stage in the Pro-Feed washer was assumed to consist of two parts: mat formation and compression. The filtration model during thickening was based on the Kozeny-Carman equation. In the washing stage, submerged displacement takes place while, simultaneously, the pulp mat thickness increases. The modelling in this stage was based on continuity equations. For this example, softwood kraft pulp was studied. Diagrams are presented for the consistency profile during thickening as well as for the impact of varying inlet consistency on the final consistency after the thickening stage. For the washing stage, typical displacement velocity and consistency profiles are given. (Author abstract) 16 refs.

Koivas, K. (Rauma-Repola, Finl); Norden, H.V.; Ahonen, L. *Filtr Sep* v 25 n 1 Jan-Feb 1988 p 42-45.

**087058 AUTOMATED CONTROL OF WASHER SHOWER WATER AT ITT RAYONIER.** Simple, low-cost, automated shower-water control systems on two unbleached-stock washer lines have provided substantial savings in evaporator steam, chemicals, and secondary treatment costs. (Author abstract) 7 refs.

Sande, W.E. (ITT Rayonier Inc Research Cent, Shelton, WA, USA); Oestreich, M.A.; Poplasky, M.S.; Stewart, J.R. *Tappi J* v 71 n 3 Mar 1988 p 93-97.

**087059 OPTIMIZATION OF FILTER WASHER OPERATION AND CONTROL.** Washer models can be generally classified as descriptive or predictive. Descriptive models include the well known plot of displacement ratio against dilution factor. A descriptive model using the Norden E-factor has proven useful. On the other hand,

predictive models that involve filtration theory and flow in porous media are relatively few. The authors look at a new washer model as it is applied to optimize filter washing operation and control. To minimize total dissolved solids carryover from brownstock washing for a given shower flow, drum vacuum is the most important operating variable. The mat formation in the new model is described using Ruth's equation and a variable specific resistance (i.e., a compressible mat). 6 refs.

Han, Yushan (Univ of Idaho, Moscow, ID, USA); Edwards, Lou. *Tappi J* v 71 n 6 Jun 1988 p 101-104.

**087060 PULP VACUUM WASHERS ARE EFFICIENT AND RELIABLE WHEN PROPERLY DESIGNED.** The author presents piping and process design considerations that affect the performance of rotary vacuum washers, including a review of the vacuum washer design and associated items that influence the operation of washers. He also points out how washing performance can be optimized to improve the mill's black liquor recovery and pulp washing efficiency as well as profitability.

**Waste Heat Utilization** See PAPER AND PULP MILLS—Water Recycling.

**Waste Liquor Utilization** See Also PAPER AND PULP MILLS—Waste Disposal.

**087061 VAPOR-PHASE COOKING OF BIRCH WITH RECYCLING OF SPENT IMPREGNATION LIQUOR.** Under the cooking conditions studied and with repeated liquor recyclings, it was possible to produce a sulfite CMP from birch, with 90% yield and good physical properties. Recycling of spent liquor for pulp production can be practiced without limit in a number of recyclings. Average steam consumption per cook including chip presteaming was about 2.57 kg per kg of wood. (Edited author abstract) 20 refs.

Lo, S.N. (Univ du Quebec a Trois-Rivieres, Trois-Rivieres, Que, Can); Baribeault, R.; Valade, J.L. *Pulp Pap Can* v 88 n 8 Aug 1987 p 50-55.

**087062 TAMPELLA RECOVERY SYSTEM FOR SMALL-SCALE PULP MILLS.** Tampella has developed a recovery system comprising the liquor burning in a package recovery boiler and the chemical conversion for sodium-based cooking processes. It is aimed at small-scale pulp mills and for mills where the recovery boiler is a bottle neck. (Author abstract) 1 ref.

Rimpi, P. (Tampella Ltd, Tampere, Finl); Hopia, R. *Pulp Pap Can* v 88 n 8 Aug 1987 p 72-75.

**087063 BLACK LIQUOR SOLIDS CONTENT: HOW HIGH IS UP?** The essential components of the black liquor system are a super-concentrator and a flash tank which are placed between the mix tank and the recovery boiler. Black liquor from the remainder of the evaporators is delivered to the mix tank at 62-65% solids. Liquor storage is done at this concentration. The system beyond the mix tank is at a solids content between 75% and 85%. With 75-85% liquor solids contents now in hand, the ultimate in treating black liquor as a pumpable liquid probably has been reached.

Grace, Thomas M. (Inst of Paper Chemistry). *PIMA Mag* v 69 n 10 Oct 1987 p 39-40.

**087064 KRAFT BLACK LIQUOR RECOVERY IN A FLUIDIZED BED: PART I - A REVIEW.** The Tomlinson recovery boiler has been the mainstay of the kraft pulping industry for over fifty years. It is clear, however, that the main drawbacks to this process are the large capital costs of new plant and the smelt-water explosion hazard. This paper examines some of the fundamental scientific information which supports the concept of fluid bed gasification as an alternative to the Tomlinson boiler. It is shown that a knowledge of thermodynamics is useful but insufficient to completely understand the behavior of the inorganic sulfur species

during pyrolysis and gasification of kraft black liquor. Recent key experimental investigations at McGill have demonstrated that solid state reduction of sodium sulfate to sodium sulfide is feasible. (Author abstract) 36 refs.

Fallavolita, J.A. (McGill Univ, Montreal, Que, Can); Avedesian, M.M.; Mujumdar, A.S. *Can J Chem Eng* v 65 n 5 Oct 1987 p 812-817.

**087065 ULTRA-HIGH-SOLIDS EVAPORATION OF BLACK LIQUOR.** Kraft black liquor evaporation systems have changed in the last two decades, with improvements in steam economy and reductions in evaporation costs. The ability to store, handle, and fire high-solids liquors and the capital costs of the high-solids equipment are the key factors that control the practicality and economic feasibility of increasing firing solids contents as high as possible. 13 refs.

Harrison, Ray E. (Weyerhaeuser Paper Co, Tacoma, WA, USA); Cheng, Peter J.; Crowell, Barbara A.; Ketcham, Elizabeth A. *Tappi J* v 71 n 2 Feb 1988 p 61-66.

**087066 1,1-DIARYLETHANES: NOVEL COMPOUNDS FROM ALKALI SPENT LIQUORS.** Five 1,1-diarylethanes were detected in three industrial alkali pulping spent liquors. Of these, two were novel compounds. The methylmethine linkages present in these compounds are expected to have formed during pulping. The degraded lignin and residual lignin in the pulp can therefore also be expected to contain methylmethine linkages. (Author abstract) 4 refs.

**Waste Utilization** See Also LIGNIN—Chemistry.

**087067 DESILICATION OF BLACK LIQUOR: PILOT PLANT TESTS.** In black liquor produced from rice straw, high silica contents have been a major obstacle against operating a recovery system. A pilot plant was set up in Egypt to continue research work on a semi-commercial scale. After three years and almost a hundred tests, operating and design criteria were obtained, and a desilication system consisting of three stages was established. These stages are: absorption of CO<sub>2</sub>; conditioning of treated black liquor; separation of silica sludge from black liquor. After modifications to the system, the pilot plant obtained desilication efficiencies of more than 90 percent. On the basis of these results, the first commercial installation of a desilication system has been built in Indonesia. (Edited author abstract) 8 Refs.

## PULP MATERIALS

**087068 PHYSICAL CHARACTERISTICS OF PULPS OBTAINED FROM MESTA (HIBISCUS SABDARIFFA) PLANTS OF DIFFERENT AGES.** Kenaf (*Hibiscus cannabinus*) and mesta (*Hibiscus sabdariffa*) are excellent substitutes for traditional softwood pulp for the manufacture of newsprint. Pilot plant studies showed that it would be possible to produce high-strength mechanical pulp suitable for newsprint from whole mesta plant. Of the two species of mesta *Hibiscus cannabinus* is used as textile fiber, while fiber from *Hibiscus sabdariffa* is coarse, with more attention paid to this variety for making paper. Paper made of pulp from 150-day-old mesta plant was stronger by about 12% than that from 120-day-old mesta plant. The authors undertook a study to see the effect of age of mesta plant on the properties of the pulp and to find out the reason for the changes of the properties of paper. 12 refs.

**Bagasse** See ALSO PULP MANUFACTURE—Waste Liquor Utilization.

**087069 BAGASSE THE BASIS FOR NEWSPRINT MILL.** Located in northern Argentina, Papel del Tucuman produces about 100,000 tons/yr of newsprint grades from a furnish which is 90% semichemical bagasse pulp. All of the output is produced on a 7.6-m twin-wire PM from Voith-Brazil, with a design speed of 800 m/min. Besides standard 48.8-g newsprint, the mill makes improved newsprint with a higher brightness and higher basis weight of 60-70 g/m<sup>2</sup>. Since harvesting takes place for only five months during the year, the mill needs to store depithed bagasse during the sugar harvests to meet its needs in the rest of the year.

Bertagni, David (Papel del Tucuman, Tucuman, Argent.). *PPI Pulp Pap Int* v 29 n 7 Jul 1987 p 59-60.

**Chemical Analysis** See PULP MANUFACTURE—Kraft Process.

## Kenaf

**087070 KENAF NEWSPRINT IS A PROVEN COMMODITY.** This paper describes the trial operations and manufacture of kenaf pulp to make newsprint and discusses the results of this trial, future prospects and economics of using kenaf.

Young, Jim (Tappi Journal, Atlanta, GA, USA). *Tappi J* v 70 n 11 Nov 1987 p 81-83.

**Straw** See ALSO PULP MANUFACTURE—Bleaching; PULP MANUFACTURE—Cooling.

**087071 MORE AND BETTER USE OF CHINA'S STRAW.** China is the biggest producer of straw pulp in the world. Over 60% of its total pulp output comes from straw, mostly wheat. The technology of pulping this raw material continues to develop and there are some problems which remain to be solved. Solutions to these problems are being sought and will be helped by a new project. During the seventh five-year plan, research is to concentrate on further developing the technology of using non-wood fiber by coordinating the work of research units, design institutes and equipment manufacturers. One aim of this program is to build an integrated pulp and paper mill producing 30-50 tons/day of offset printing papers for books and magazines. These papers should contain more than 80% bleached wheat straw pulp. The site for the mill is Taizhou in Jiangsu Province.

**Sulfonation** See PULP MANUFACTURE—Refining.

## Waste Paper

**087072 REMOVAL OF SPECKS AND NONDISPERSED INK FROM A DEINKING FURNISH.** As the requirements for faster and higher quality printing have increased, so the ink types have become more sophisticated, and the fixing methods have moved toward fast, hard drying. This trend has led to deinking furnishes with even greater amounts of inks which, once dried, cannot be adequately dispersed by the conventional deinking techniques and which generate visible specks. Until now, it has been difficult to remove these particles. The result has been that paper mills have had to tolerate visible specks in the final product, which is not acceptable, or that they have had to try to eliminate such waste grades from the furnish, which is no longer practical. Consequently, a program has begun at our company to contend with the problem of specks. The result is that we now have some understanding of the behavior of specks, we are able to define methods for removing them, and we can predict the system performance. 2 refs.

**087073 TECHNO-ECONOMIC PROBLEMS IN**

**THE PRODUCTION AND USE OF WASTE PAPER PULP.** The paper discusses a recycling strategy for paper and process engineering aspects of waste paper pulp production. Subjects covered include manufacture and converting of new papers, removal of printing inks and stickies from waste paper pulp, and others.

Baumgarten, H.L. *Conserv Recycling* v 10 n 2-3 1987, Recycl of Mater, Sel Pap from the Fifth Int Recycl Congr, Berlin, West Ger, Oct 29-31 1986 p 109-123.

**Wood** See ALSO PAPER AND PULP MILLS—Brazil; PAPERMAKING MACHINERY—Design; PULP—Thermomechanical; PULP MANUFACTURE; PULP MANUFACTURE—Cooking; PULP MANUFACTURE—Reaction Kinetics; PULP MANUFACTURE—Sulfite Process; PULP MANUFACTURE—Sulfonation; WOOD—Bark Stripping; WOOD—Hydrolysis; WOOD—Oxidation.

**087074 EUROPEAN HARDWOODS - THE RAW MATERIAL OF THE FUTURE.** A three-year research program on Wood as a Renewable Raw Material has been completed by the EEC. The program had as its aim, the better use of Community raw materials and the development of enabling technology. This article summarizes the findings of the 21 scientists who reported at a seminar in Brussels last November. It is concluded that pulp and papermaking is entering an era of considerable change, and the technology of the future will make fully utilizable pulps from European hardwoods like poplar. (Edited author abstract) 21 refs.

**087075 EUCALYPTUS CTMP MILL UNDER STUDY.** By 1997, clonal eucalyptus plantations in the Congo will produce 2 million m<sup>3</sup>/yr of wood. Plans for a market CTMP mill to use this resource are now under study. Clonal plantations produce a given volume of wood in 40% of the surface are required by traditional eucalyptus plantations in the Congo in the early 1970s and in 20% of the area required to produce the same volume of softwood in temperate regions. Plantation costs are 50% of those in temperate regions and the investment costs are only 10%. Plantations at present spread over 25,000 ha. The plantations established since 1978 are yielding around 20 m<sup>3</sup>/ha/yr, producing a current annual growth of 500,000 m<sup>3</sup>. New clones now available should yield at least 30 m<sup>3</sup>/ha/yr.

LaPlace, Yves (L'Unité d'Afforestation Industrielle du Congo); Cockram, Richard. *PPI Pulp Pap Int* v 29 n 7 Jul 1987 p 52-53.

**087076 WHEN THE FUTURE LIES IN THE FOREST.** Commercial forest plantations in Chile cover 1.2 million ha, of which 90% - 1.1 million ha - were radiata pine. This species is originated in California, where it is known as Monterey pine. Estimates show that a figure of 1.6 million ha will be reached by 1995. Radiata pine owes its success to its fast healthy growth under the climatic and environmental conditions found in central-southern Chile. Radiata pine grows at an average 22-23 m<sup>3</sup>/ha/yr, which compares favorably with about 7 m<sup>3</sup>/ha/yr for US Southern pine and 5 m<sup>3</sup>/ha/yr for Swedish pine. Chile's pulp exports are likely to reach 1.15 million tons by 1995, mostly for Asia and Europe.

Tuset, Antonio. *PPI Pulp Pap Int* v 29 n 6 Jun 1987 p 60-62.

**087077 UPGRADING WOOD CHIPS: THE PAPIRER PROCESS.** Much of the world's pulp and paper is produced from wood chips, the cost and quality of which have a marked effect on the profitability of a mill and on the marketing of its products. In recent years, the search for higher quality and/or cheaper sources of fiber has stimulated interest in developing better methods for upgrading chips. The Papirer process can make use of whole-tree chips, raw mill chips, chips from partially decayed trees, and chips from logging residues. 27 refs.

## PULSE AMPLITUDE MODULATION

**087080 INFLUENCE OF CYCLE SLIPPING ON THE ERROR PROBABILITY OF A PAM RECEIVER.** An evaluation is presented of the error probability of a pulse-amplitude modulation (PAM) receiver, which derives symbol timing from the received waveform by means of a synchronizer. The author points out that the conventional way of evaluating this error probability (using the distribution of the synchronizer's modulo-2 $\pi$  reduced phase error) does not take into account the effect of the synchronizer's cycle slips. A correct expression for the error probability is given, which uses the distribution of the so-called renewal phase. Simple but accurate approximations are derived for both the conventional and the correct error probability, which clearly show the influence of the characteristics of the PAM receiver. These approximate expressions indicate that, for a decreasing additive noise level at the receiver input, the conventional error probability becomes vanishingly small; the correct error probability approaches a nonzero value, which is inversely proportional to the mean time between slips. Hence, cycle slipping imposes a (sometimes rather large) lower limit on the attainable error probability. 13 refs.

**087081 DIGITAL PCM - AN ALTERNATIVE TO FM INSTRUMENTATION RECORDING.** Instrumentation tape recorders are used in a variety of applications where the requirements is to record the information from transducers for subsequent analysis. Until now FM recording has remained largely unchallenged in the field of instrumentation, partly because it is insensitive to varying tape parameters and can therefore provide more repeatable results. The price to pay for this increased performance is a narrow bandwidth: FM recorders cannot attain the same bandwidths as direct recording and so they consume more tape. Digital recording, on the other hand, is completely insensitive both to tape noise and transport speed variations: dynamic range is limited solely by electronic noise. Off-tape signals are identical to E-to-E

signals, and figures of 96db are easily achieved. This represents at least two orders of magnitude increase in range over FM recording.

**087082 EVALUATION OF ADPCM CODERS FOR DIGITAL CIRCUIT MULTIPLICATION EQUIPMENT.** This paper describes test results for a set of experimental procedures designed to objectively measure the performance of four adaptive differential pulse-code modulation (ADPCM) algorithms that use signals other than voice. These algorithms have been under consideration by the International Telegraph and Telephone Consultative Committee (CCITT) as possible low-bit-rate coders for incorporation in digital circuit multiplication equipment. The results presented pertain to voiceband data modems operating at 9,600 bit/s or higher, and include analog performance measurements for each of the algorithms considered. (Author abstract) 19 refs.

**087083 64 KBIT/S AUDIO SIGNAL TRANSMISSION APPROACHES USING 32 KBIT/S ADPCM CHANNEL BANKS.** Two simple 64-kb/s wideband coding approaches using 32-kb/s ADPCM (adaptive differential pulse-code modulated) channel banks are proposed and compared to CCITT 64 kb/s ADPCM, which is being recommended as CCITT G.722. These two, folding ADPCM and QMF ADPCM, are intended to pave the way for smooth transition from conventional 4-kHz band telephone systems to 7-kHz wideband systems in private networks. The first approach, supporting high-quality audio program transmission, requires only samplers and multiplexers at the input and output ports of the channel banks. In the second approach, samplers and multiplexers are replaced by quadrature mirror filters in order to increase coding quality. Performance test results for audio signal transmission show that these simplified approaches provide an inexpensive way to introduce wideband communication systems. 4 refs.

**087084 ADPCM WITH A MULTIQUANTIZER FOR SPEECH CODING.** A speech coding algorithm with low complexity and a short processing delay is introduced. The proposed algorithm is ADPCM (adaptive differential pulse code modulation) with a multiquantizer (ADPCM-MQ). The input signal is processed in parallel by multiple ADPCM coders with different characteristics. Then the optimum ADPCM coder with minimum error power is dynamically selected for each frame. A 16-kb/s codec based on this algorithm has been implemented using two general-purpose digital signal processors (MB8764) with 8.3 ms of total processing delay. A segmental SNR of 19-21 dB was achieved at 16 kb/s; with postfiltering the segmental SNR was increased to 23-25 dB. Combined with the time domain compression scheme, the algorithm can be easily applied to 8-kb/s coding. It is also extensible to variable-rate coding. 15 refs.

## Equipment

**087085 COMPACT 60-CHANNEL ADPCM TRANSCODER.** This paper describes the DTC-60A, a new 60-channel ADPCM transcoder for European CEPT networks. The DTC-60A implements a conversion between two 2048 kbps PCM streams and a single 2048 kbps ADPCM stream, using CCITT Recommendation 32 kbps

ADPCM algorithm (G.721). NEC developed ADPCM codec LSIs are used in per channel basis for mutual conversion between PCM and ADPCM signals, thereby reducing equipment cost, size and power consumption. Other important characteristics of the DTC-60A include easy maintainability, compliance with the CCITT Recommendation (G.761), and versatile programming and alarm display functions provided by the portable control terminal (PCT). (Author abstract) 5 refs.

## Mathematical Models

**087086 32 KBIT/S ADPCM ALGORITHM HAVING HIGH PERFORMANCE FOR BOTH VOICE AND 9.6 KBIT/S MODEM SIGNALS.** A description is given of an advanced 32-kb/s ADPCM (adaptive differential pulse code modulation) algorithm and its implementation in a single-chip custom LSI using 2-μm CMOS technology. The performance of the proposed codec, in terms of voice and modems operating at 1200-9600 b/s, is also discussed. The results indicate that the codec provides speech quality equivalent to that of the CCITT G.721 ADPCM and is capable of transmitting V.23 1200 b/s and V.27 and V.29 4800 b/s signals over at least four asynchronous tandem links. It can also transmit V.29 modem signals at 7200 b/s over at least four and at 9600 b/s over two asynchronous tandem links, and V.32 signals at 9600 b/s over four asynchronous tandem links. 12 refs.

## Performance

**087087 COMBINING SOFT-DECISION DEMODULATION WITH BIT ERASURE CORRECTION AND WEIGHTING TO REDUCE THE EFFECT OF TRANSMISSION ERRORS IN LOG-PCM.** We analyze an improved soft-decision demodulation technique applied to μ-law pulse code modulation (PCM). The PCM-encoded waveforms are transmitted over Gaussian and Rayleigh fading channels by means of coherent phase shift keying modulation. Received bits which are unreliable are identified by means of soft-decision demodulation and erased. Each bit in the PCM word is assigned its own erasure threshold. The thresholds are optimized and are thus theoretically determined as a function of input power level to the quantizer, channel type and snr, and the relative mean-square error power that occurs when a PCM word containing an erased bit is estimated by means of prediction or interpolation. (Edited author abstract) 22 refs.

**087088 RANDOM PULSE GENERATOR WITH A UNIFORMLY DISTRIBUTED AMPLITUDE SPECTRUM.** The described pulse generator produces a white pulse amplitude spectrum in addition to an optional calibration peak. Amplitudes and pulse distances are nearly randomly distributed. The amplitude of the output pulses, with a width of 2 μs, ranges from 0.1 to 10 V<sub>p</sub>. The rate may be varied from 0.1 to 110 kips. The unit has been developed for applications in nuclear physics. It will mainly be used to test large experimental setups, and for calibration of parameters. In some cases, measurements of nonlinearities will be possible. Distortions of the white

spectrum which may occur if the pulses are converted by an ADC with amplitude dependent dead time (Wilkinson type) have been considerably reduced. (Author abstract) 3 refs.

**087089 CAPACITANCE FREE GENERATION AND DETECTION OF SUBPICOSECOND ELECTRICAL PULSES ON COPLANAR TRANSMISSION LINES.** By reanalyzing an earlier experiment to generate subpicosecond pulses using photoconductive switches (1986), it is shown that to first order, the sliding-contact generation site has no capacitance. This conclusion is further supported by a double sliding-contact experiment where, to first order, neither the generation nor the detection site has any capacitance. This result removes the parasitic capacitance of the electrical circuit as one of the major difficulties to short electrical pulse generation using photoconductive switches. 12 refs.

## Applications

**087093 EINFACHER IMPULSGENERATOR FUER DIE NANOSEKUNDEN - PRUEFTECHNIK.** [Simple Pulse Generator Adapted to the Nanosecond Test Technique]. The nanosecond test technique is increasingly important in the development and quality control of modern systems of electric power. A simple pulse generator is described in which is frequently applied in the evaluation of electric insulations during short duration loads and in the solution of problems of electromagnetic

compatibility. (Edited author abstract) In German. 9 refs.

Haller, R. (TU Dresden, East Ger); Schmigel, P. *Elektrie* v 41 n 3 1987 p 93-96.

## Computer Applications

**087094 MICROPROCESSOR-BASED GPIB COMPATIBLE PROGRAMMABLE PULSE GENERATOR.** This paper presents a 'Microprocessor-based, GPIB Compatible programmable pulse generator' which can be programmed both in the local mode and the remote mode. The programming parameters are (i) frequency, (ii) width or duration and (iii) amplitude. A new technique called direct digital synthesis with microprocessor control has been used for the generation of square waves from 1Hz to 1MHz in steps of 1Hz. The pulse generator realized using the above technique has arbitrarily high resolution, high switching speed, very low power consumption, high reliability and low cost. Also, GPIB interface circuits have been incorporated for remote operation. (Author abstract) 2 refs.

Madivanan, S. (Naval Science & Technological Lab, Visakhapatnam, India); Shivaprasad, A.P. *IETE Tech Rev* v 4 n 3 Mar 1987 p 88-92.

**087095 MICROPROCESSOR BASED PULSE GENERATOR.** A microprocessor based pulse generation technique is discussed. The desired frequency, amplitude, duty cycle and polarity of the pulses are selected through the keyboard and effected with the help of software routines. (Edited author abstract) 3 refs.

Bendigeri, G.K. (Madras Inst of Technology, Madras, India); Mathialagan, A.; Gunasekaran, G. *J Inst Eng India Part ET* v 68 pt 1 Aug 1987 p 1-4.

## Design

**087096 DESIGNING A HIGH-SPEED PULSE GENERATOR.** The cost of fault isolation and correction rises exponentially as system build progresses from component level, through board, sub-system and system levels, with field repair costs at the top end of the scale. In the case of circuits where the critical timing paths may be exercised by a repetitive pulse train, it is often better to characterize these devices using dedicated parametric test equipment, to ensure that parameters such as setup and hold times, propagation delays, access times and maximum clock frequencies meet specifications. To perform these tests, the stimulus source used is typically a dedicated pulse generator. The key features required from a programmable pulse generator are discussed, and a pulse generator is described capable of supplying pulse repetition rates to 200MHz, sufficient for testing the maximum operating frequencies of LSITL, HCMOS and FAST.

Aitken, Mike (Datron Instruments). *New Electron* v 20 n 12 Jun 9 1987 p 43, 46.

**087097 STANDARD IMPULSE GENERATOR DESIGN BY SPECTRAL REPRESENTATION AND APPROXIMATION METHODS.** Designing standard impulse generator by analytical methods is a tedious task because of the complicated form of the relations between parameters and variables. This paper presents a new method which consists in the construction of associate and efficiency functions by spectral representation. Their minimization, by an iterative second order procedure built by approximation in the Hilbert space, guarantees an impulse whose distance from the desired standard form is minimal. (Author abstract) 3 refs.

**Energy Storage** See ELECTRIC SWITCHES—Measurements; ELECTRIC SWITCHES—Vacuum Applications.

## Laser Applications

**087098 LASER TRIGGERED CHOPPED WAVE GENERATOR.** A 200-kV-dc SF<sub>6</sub>-insulated spark gap is

triggered by an ultraviolet laser pulse (KrF,  $\lambda = 249$  nm) to chop a 3/10  $\mu$ s pulse in less than 10 ns. By simply adjusting the internal delay of the laser, the pulse can be chopped anywhere on the front or on the tail, and at voltages as low as half of the spontaneous breakdown voltage of the gap. The shape and length of the waveform are precisely controlled, and jitter is reduced to less than 10 ns at 80% of the spontaneous breakdown voltage. 11 refs.

**Performance** See Also SQUARE WAVE GENERATORS—Performance.

**087100 HIGH-VOLTAGE PULSE GENERATOR WITH HIGH ACTUATION FREQUENCY.** A six-stage Arkad'ev-Marks generator with a voltage of up to 300 kv and an actuation frequency of up to 100 pulses/sec is described. The capacitance of the generator in discharge is 1.7 or 4.2 nF, the maximum pulse energy is 180 J, and the half-height pulse duration is 3-4.5  $\mu$ sec for a capacitive load. (Author abstract) 7 refs.

Kapishnikov, N.K. (Tomsk Polytechnic Inst, USSR). *Instrum Exp Tech* v 30 n 2 pt 1 Mar-Apr 1987 p 336-339.

**087101 NANOSECOND PULSE GENERATOR.** A nanosecond pulse generator is described that is implemented by avalanche transistors. The pulse amplitude is up to several hundred volts, the rise and fall times are approximately 1 nsec, and the repetition frequency is up to 10 KHz. (Author abstract) 4 refs.

Bernashevskii, G.A. (Acad of Sciences of the USSR, Moscow, USSR); Voroshen', V.I.; Milovanov, S.A. *Instrum Exp Tech* v 30 n 2 pt 1 Mar-Apr 1987 p 340-342.

**087102 RESONANT MEGAVOLT PULSE GENERATOR.** A compact pulse generator with a capacitive load is described that employs resonant voltage multiplication at the load. A 60-pF capacitor is charged to 1.1 Mv in a pulse with a rise time of 0.25  $\mu$ sec. The dimensions of the resonant generator are considerably smaller than those of known Tesla-coil voltage sources (by a factor of approximately 30 in volume). (Author abstract) 7 refs.

Zhel'tov, K.A.; Malygin, A.V.; Petrenko, A.N.; Shalimov, V.F. *Instrum Exp Tech* v 30 n 2 pt 1 Mar-Apr 1987 p 343-345.

**087103 CURRENT-PULSE GENERATOR FOR ELECTROMAGNET OF INDUCTION ACCELERATOR.** A thyristor generator is described that produces in the winding of the electromagnet of a betatron unipolar current pulses of sinusoidal and quasisinusoidal shape with deforming of the field at the beginning of an acceleration cycle and with a plateau on the pulse top at the end of a cycle. The current amplitude is controlled by a pulse-phase method. The generator is used in apparatus with a pulse duration of 1-10 msec, a maximum electromagnet field energy 45-450 J, a winding voltage of 960-1500 v, and a winding current of 100-500 A for a repetition frequency of 50-200 Hz. (Author abstract) 5 refs.

Makarevich, V.N.; Shtein, M.M. *Instrum Exp Tech* v 30 n 3 pt 1 May-Jun 1987 p 512-514.

**087104 HIGH-VOLTAGE NANOSECOND PULSE GENERATOR WITH GIN-500-0.02/3 FOR STREAMER CHAMBER.** A high-voltage nanosecond pulse generator for a 2-meter streamer chamber and track spark chambers is described that contains a dual-shaping-line pulsed charge generator based on a stock GIN-500-0.02/5 unit. Transformer oil is used to insulate the main gaps of the charge generator; a pulse with an amplitude of up to 50 kv and a duration of 12.0 nsec is obtained with a matched line load (38  $\Omega$ ). A pulse with an amplitude of up to 300 kv is obtained at the load when nitrogen is used instead of transformer oil. The generator has operating lives of  $10^5$  and  $5 \cdot 10^4$  actuations in the former and latter cases, respectively. (Author abstract) 8 refs.

Aksinenko, V.D. (Joint Inst for Nuclear Research, Dubna, USSR); Glagoleva, N.S.; Dement'ev, E.A.; Kaminskii, N.I.; Matyushin, A.T.; Matyushin, V.T.; Nugrozhin, N.N.; Ryakhovskii, V.N.; Khushainov, E.K.; Shevchenko, E.A. *Instrum Exp Tech* v 30 n 3 pt 1 May-Jun 1987 p 601-603.

**087105 HIGH-VOLTAGE NANOSECOND PULSE GENERATOR FOR TRIGGERING OF MEGAVOLT PEAKING DISCHARGES.** A high-voltage nanosecond pulse generator is described that is designed for synchronous triggering of several megavolt peaking dischargers. It produces pulses with an amplitude of 300-200 kv and a rise time of 7-20 nsec for a variation of the total impedance of the lines of the transmission system of from 50 to 9  $\Omega$ . The triggering system of the generator ensures an actuation stability of  $\pm 10$  nsec for an isolation-circuit inductance of up to several tens of microhenries. (Author abstract) 3 refs.

**087106 HIGH-POWER NANOSECOND PULSE-TRAIN GENERATOR.** A generator is described that provides at the load a pulse train with a repetition frequency of  $10^3$ - $10^6$  Hz or higher. The pulses have an amplitude of up to 150 kv for a duration of 50 nsec. The generator contains two shaping and two transmission lines of KVI-300 low-impedance cable, which are connected in series with the load. The shaping lines are powered by two independently triggered voltage-pulse generators to produce a pause between pulses of  $> 10^{-6}$  sec. Due to loss reduction in the discharge circuit, the amplitude of the second pulse increases with an increase in the pause between pulses of up to 300 nsec, beyond which the curve is saturated. (Author abstract) 7 refs.

**087109 OPEN CIRCUIT SYSTEM FOR PULSED POWER APPLICATION.** The use of inductive energy storage for generation of pulsed high power current becomes an economically attractive alternative. However, it requires the high technique of open circuit device to invert the current of storage coil into load. In this paper, the present status of opening devices are surveyed. Principles and abilities of some types of open switches also are described. It is concluded that the GTO switch is most favorable to be adopted for the next plasma experimental machine of our project. (Author abstract) 77 refs. In Japanese.

#### Analysis

**087110 ERROR REDUCTION IN TWO-DIMENSIONAL PULSE-AREA MODULATION, WITH APPLICATION TO COMPUTER-GENERATED TRANSPARENCIES.** This report deals with the synthesis of band-limited functions that are generated by properly low-pass filtering a regular array of area-modulated unit-height pulses. Simply choosing the pulse areas proportional to the corresponding sample values of the band-limited function to be generated would result in an error. The exact relationship between the pulse areas and the corresponding sample values of the band-limited function to be synthesized is derived. Error reduction can be achieved by using this relationship to calculate the pulse areas from the required sample values; in principle, a band-limited function can thus be realized to any degree of accuracy. It is shown which amount of error reduction can be obtained when only a limited number of terms of the exact relationship is taken into account. The application to computer-generated half-tone transparencies is described. (Author abstract) 12 refs.

#### Microwaves

**087111 CORRECT TIMING OF SAMPLE-AND-HOLD SYSTEM IMPROVES LEVELING PERFORMANCE.** Conventional pulse modulation techniques for rf and microwave frequency sources usually place the modulating device downstream of the rf level detector. Although this method usually produces acceptable pulse envelopes, the insertion loss of the modulator severely limits the available rf output power. Unless some means of isolating the level detector from the pulse modulator is used, reflections often degrade the leveled power accuracy of the source. Most practical pulse modulators require more time to turn off than to turn on, thus creating an unavoidable compression of the rf pulse. Systron-Donner has developed and implemented a unique sample-and-hold technique that overcomes these limitations.

**087114 NEW SPWM INVERTER WITH MINIMUM FILTER REQUIREMENT.** A new sinusoidal pulse width modulation (SPWM) control technique for simplifying the implementation of the SPWM method and minimizing the requirement of the voltampere rating of the inverter input filter is described and analysed. With the proposed modulation scheme, the regeneration of low-order harmonics caused by the input voltage fluctuation can be suppressed and the peak fundamental output voltage can be regulated rapidly and precisely by the dual voltage feedback control. Only a minimum voltampere rating of the inverter input filter is required for avoiding overmodulation. The theoretical results of the proposed approach with open-loop self-regulating property are discussed and experimentally verified. (Author abstract) 6 refs.

Lee, Jia-You (Nat'l Cheng-Kung Univ, Tainan, Taiwan); Sun, York-Yih. *Int J Electron* v 64 n 5 May 1988 p 815-826.

**087115 NOVEL SINUSOIDAL PULSE WIDTH MODULATION SCHEMES FOR VOLTAGE-SOURCE INVERTERS WITH FLUCTUATING INPUT VOLTAGE.** The optimum waveform parameters of pulse positions and pulse widths for voltage-source inverters with fluctuating input voltage are proposed. Eight types of modulation schemes are described for synthesizing the optimum low-distortion output waveforms, of which the harmonic spectra and the peak fundamental-value are almost insensitive to the input-voltage fluctuation, with a minimum voltampere rating of inverter input filter. For fluctuating inverter input voltage with

insufficient filtering, the type-VII and the alternative type-III modulation schemes are found to be especially suitable for practical implementation. Detailed descriptions of the suggested circuits with dual-feedback control for implementing two such modulation schemes are given. A peak-value detector that can rapidly produce the peak value of the inverter output voltage with a minimum time constant is also proposed. The theoretical results of the proposed approaches with open-loop self-regulating property are experimentally verified and compared with the conventional method. 14 refs.

**087116 HARMONIC ANALYSIS OF PWM INVERTER MODULATION STRATEGIES.** This paper presents the harmonic analysis of various pulse width modulation strategies used for the dc-ac converters. An efficient harmonics computation algorithm for piecewise continuous periodic waveforms has been derived. Fourier coefficients of experimentally obtained waveforms or simulation results can be calculated efficiently. Harmonic performance analysis of natural sampling, modified sub-harmonic control, symmetric/asymmetric uniform, sinusoidal pulse width modulation, and pulse position modulation strategies have been studied. Results can be used as guidelines for the modulation strategies selection in the PWM inverter design. (Author abstract) 13 refs.

**087117 ANALYSIS AND REALIZATION OF A PULSEWIDTH MODULATOR BASED ON VOLTAGE SPACE VECTORS.** A space vector concept for deriving the switching times for pulsewidth-modulated voltage source inverters is compared with the conventional sinusoidal concept. The switching times are deduced from assumptions for minimum current distortion, the resulting mean voltage values are shown, and the differences between these and the established sinusoidal PWM (pulse-width modulator) are elaborated. Based on an analytical calculation the current distortions and torque ripples are evaluated and compared with the values obtained with the conventional method. The space vector representation results in lower current harmonics and possibly a higher modulation index. A modulator based on an 8086 microprocessor has been implemented, and its performance is reported. 16 refs.

**087122 ASH FORMATION DURING PULVERIZED COAL COMBUSTION. 1: AERODYNAMIC INFLUENCES.** The elemental composition of pulverized fuel boiler often differs markedly from that of the corresponding fly ash and coal ash. Evidence is given here to support the hypothesis that such chemical segregation could be induced by competition between aerodynamic drag and inertial forces on a particle in a curved streamline; this increases the probability of impacting the boiler walls for large particles of high density, leading to preferential deposition. A conventional air classifier was used to separate mono-sized samples of pulverized coal and char particles into aerodynamically different fractions, and to prepare vitrinite-char and inertinite-char concentrates. The relevance of such aerodynamic segregation is considered by comparing the enrichment (or depletion) of non-volatile elements in boiler ashes with that in ashes derived from air-classified char fractions. (Edited author abstract) 29 refs.

**087124 TRANSIENT CONDUCTION IN A SPHERE WITH COUNTERACTING RADIATIVE AND CONVECTIVE HEAT TRANSFER AT THE SURFACE.** In some important industrial processes cold reactive powders are raised to their reaction or ignition temperature during passage from the entrance of a reactor toward a standing flame front. Changes in the particles during this pre-ignition phase are largely determined by the temperature history they experience. A model for heat transfer to and within a spherical particle during the pre-ignition phase is presented that yields predictions of the required temperature changes. Such predictions are needed for the refinement of reaction models. The predicted temperature histories are shown to be in excellent agreement with a numerical solution of the problem. (Author abstract). 10 refs.

**087125 MEETING RISING WATER DEMANDS: NEW PUMPS ARE THE KEY.** In Oshkosh, long-term demand for water service had been on the rise for years, putting a strain on its water filtration plant. The city recognized the problem and in 1981 retained the consulting firm of Howard Needles Tammen & Bergendoff to study water treatment requirements. When it became evident that there was a need for modifications to the old high service pumping station, the concept of combining both the low lift and high service pumping facilities began to be explored. The consultant determined that economy and efficiency of operation could be achieved by combining both facilities in a single structure. With a total project cost of \$1,453,000, the net unit construction cost of the new pumping station was five cents per gallon. The new water pumping station is a single structure, unmanned and operated remotely from a new automatic control center in the existing water filtration building. It contains three 5-mgd rated low lift vertical turbine pumps. A fourth pump bay is available for another pump.

**087126 WATER INDUSTRY ASSESSMENT OF PUMPING REQUIREMENTS.** The article seeks to identify the requirements of the water industry in respect of serviceability, maintenance, efficiency, and capital revenue costs. It deals with the assessment and trade-off of these elements in financial terms using DCF analysis techniques. The article also makes specific reference to the use of different methods of variable speed control as appropriate and is based on the end users' viewpoint.

Ellis, A.K. (Severn-Trent Water Authority, Engl). *World Pumps* Oct 1987 p 313-316.

**087127 PUMPING - SYSTEMS APPROACH.** Increased emphasis in recent years on plant economics at the design stage whether it be a process plant, a power plant or water works, has highlighted the importance of

matching the pumping equipment with its system. The article brings out that a good pumping system is not merely a cluster of highly efficient individual pieces of equipment but is an assembly of mutually dovetailed equipments engineered to meet the overall objectives. The systems approach emphasizes the importance of considering all relevant aspects of the whole system before any part of the system is selected. This approach will also establish the parameters of each equipment, avoid costly delays in commissioning and can lead to a better rapport among the client, the consultant and the manufacturer. ## Control

**087129 MULTIPLEXER SLASHES MAINTENANCE COSTS FOR WATER TREATMENT PLANT.** The article discusses the installation of a Dupline two-wire transmission systems for monitoring and control to control remote pumping stations at the Granby Water Treatment Plant in Quebec. The multiplexing system is manufactured by Electromatic Components, of Montreal. The Dupline is based on a single two-wire cable for two-way transmission of digital pulse codes. It consists of a standard two-wire transmission cable, transmitters, receivers and a channel generator. Up to 128 separate signals can be transmitted through each pair of wires. The plant is currently using 40 channels of the 128 available. The system is used to start and stop the pumps, monitor alarms and monitor the status of the various pumps. These and other aspects of the subject are discussed.

## Energy Management

**087131 ENERGY MANAGEMENT CONSIDERATIONS AND THEIR APPLICATION.** The most significant use of energy by the water industry is in the consumption of electricity, which is attributable to the many pumping operations undertaken. For most water undertakings, this represents more than 85 percent of all energy used and involves several millions of pounds expenditure per annum. Therefore pumping operations warrant particular attention in energy management approach. Energy management can be related as a require-

ment to check both the economics of operations as well as to improve energy efficiency generally. With this consideration, examples are given of changes that have been made to pumping operations which are compatible with satisfying increasing demands for pumping and operational flexibility in an environment of rising energy costs. (Author abstract) 3 refs.

**Performance**

**087133 POND CREEK PUMPING STATION SOUTHWESTERN JEFFERSON COUNTY, KENTUCKY.** A 1:20-scale pumping station model of the sump and gravity control, approach, stilling basin, and exit channel was used to investigate and develop a practical design that would provide satisfactory hydraulic performance. The pumping station and gravity control structures were combined by locating the gravity control below the sump. The pumping station consisted of four vertical pumps with a total capacity of 4,100 cfs. The gravity control section had a capacity for 17,000 cfs and consisted of an open-channel flow structure and tainter gate to maintain the pool. During operation of the pumps, surface vortices observed in the pump bays were eliminated by surface vortex suppressor beams. During operation of the gravity control structure, eddies and an unstable hydraulic jump observed in the stilling basin were eliminated by decreasing the rate of sidewall flare and strategically locating and increasing the height of the baffle blocks. **087134 LOW-COST PUMPING STATION ON THE UMGENI RIVER.** The paper describes a pump station installed by the Umgeni Water Board to pump Umgeni river water from a point 16 km from the river mouth to a new water treatment works in Durban. An outline is given of the background to the establishment of the pump station and the constraints on its construction. The required performance criteria are detailed as well as the installed equipment.

Taylor, Graham; Ward, Graham. *S Afr Mech Eng* v 37 n 8 Aug 1987 p 350, 352-353.

**Testing**

**087135 TESTING OF A PUMPHOUSE WITH A HORIZONTAL CAPSULE UNIT.** The creation of pumphouses (PH) with high feed is necessary to the circulating water supply of high-power thermal and

nuclear power plants and large treatment systems. The equipment now in use at PH with axial pumps is based on layouts with elbowed water feed and discharge. However, this arrangement cannot meet the imposed requirements as a result of limitations on unit output and diameter of the impeller. For a number of years the Leningrad Polytechnic Institute has been conducting experimental and technical-economic studies to determine the parameters of low-head PH. A large power engineering experimental stand and a model unit were created to develop a design for a horizontal capsule unit. The purpose of the power hydraulic tests was to obtain universal characteristics of the capsule unit and to investigate the effect of the feed components on the operating characteristics. Measurements of all the operating parameters of the unit were carried out with standard calibrated instruments. 5 refs.

**087136 PUMPS FOR POWERING HYDRAULIC MINING EQUIPMENT.** The Chamber of Mines of SA Research Organization has for some years conducted investigation into ways of improving the mechanization of stopping operations. It has identified hydraulic power as one of the most suitable means of providing the necessary forces in confined spaces. The article describes the preparation of specifications for pumps for powering hydraulic mining equipment.

Stanton, Ken. *S Afr Mech Eng* v 37 n 8 Aug 1987 p 355-357.

**087137 NEW TRIPLE-SCREW PUMPS FOR PUMPING HIGH-VISCOSITY LIQUIDS.** New pumps were designed for pumping liquids of viscosity 10 to 60 cm<sup>2</sup>/sec with inlet pressure up to 7.65 MPa and exit pressure up to 9.61 MPa at delivery rates 0.333, 1.25, and 4.45 t/sec and rpm 800 to 1250. In the double-flow pumps, because of the herringbone threading of the screws, the axial forces on them are mutually balanced. The residual axial forces on the leading screw are absorbed by the ball bearing set in the forward roof of the pump. The bearing is lubricated with grease. The pump body is made of steel, the screws are of steel, and the casing is made of bronze. In the screws the sharp edge of the following screw is blunted by making a radial facet of length 0.025 d (here d is the outer diameter of the following screw). Such a facet ensures adequate reliability and wear resistance of screws when pumping pure mineral oils of optimum viscosity (0.37 to 4 cm<sup>2</sup>/sec). Tests demonstrate the operational reliability of these pumps. 5 refs.

**087138 DIAPHRAGM METERING PUMPS: OPTIMIZED AND MORE SOPHISTICATED.** Diaphragm metering pumps make an important contribution towards a cleaner environment and increased safety in the chemical industry. Without these pumps it would no longer be possible to produce toxic, radioactive, or caustic media. Diaphragm metering pumps with a freely moving diaphragm (mostly made of PTFE) and fitted into a hydrodynamically optimized product chamber, with constant rear end position of the diaphragm (position control), are a reliable process component, which meets the requirements of environmental protection, accuracy, and a high degree of availability as well as low maintenance costs. In the case of diaphragm metering pumps with hydraulic support, the piston operates in a physiologically safe and pure hydraulic medium with excellent lubricating properties. The diaphragm, preferably made from PTFE and usually designed as multilayer units fitted with a diaphragm rupture indicator, separates the hydraulic fluid from the process fluid. The installation, maintenance and modular design of such pumps are discussed.

Anon. *Chem Ind Int (Engl Transl)* n 2 1987 p 20, 25-26.

**087139 HIGH-PRESSURE DIAPHRAGM PUMPS: IMPROVEMENTS - BUT NO NEW DEVELOPMENTS.** Diaphragm pumps can be used in all cases where abrasive fluids have to be pumped. Moreover, they have the advantage that even chemically aggressive media can be handled. Such pumps can be employed advantageously as continuously operating pumps for pressures of up to 500 bar or, in the same pressure range, as discontinuous/intermittent pumps and for metering purposes. The design, operation, regulation through added air, performance of diaphragm pumps and problems of material selection for them are discussed.

Anon. *Chem Ind Int (Engl Transl)* n 2 1987 p 34-37.

**087140 POWERMASTER PUMP AND MOTOR LINE FOR MOBILE HYDRAULIC SYSTEMS.** From its U.S. headquarters in Sterling, Va., Dowty Industrial Corp. markets a state-of-the-art mobile hydraulic product line. Products include high performance gear pumps in single and tandem combinations, power steering pumps, gear motors, high torque vane type rotary actuators, axial piston units, low speed high torque piston motors and auxiliary circuit components. An all cast iron, three part body construction is utilized. Cast iron construction is particularly important in mining applications.

Wilson, Rob. *Diesel Prog North Am* v 54 n 3 Mar 1988 p 12-13.

**087141 PLANNING HIGH-PERFORMANCE PUMPS FOR WATER TRANSPORTATION AND PIPELINE SERVICE WITH CAD TOOLS.** The article first describes the double-flow, one- to three-stage volute casing pump of the RDLP product line with axially split casing. Based on the mathematical relation between pump dimensions on the one hand and pump operating data and characteristic curves on the other hand, CAD is used to quickly find the best-suited pumps for a certain inquiry, compare their characteristics, choose from several alternatives and finally calculate the main dimensions, weights and quotation curves of these pumps and print them out together with a sectional drawing of the pump. With this method, design drawings of the pumps are no longer required. (Author abstract)

**Analysis**

**087143 MODELING AND ANALYSIS OF THE DYNAMICS OF A VARIABLE-DISPLACEMENT VANE-PUMP WITH A PIVOTING CAM.** Variable-displacement vane-pumps, modulated by a pivoting cam, are used extensively in modern automotive transmissions. This paper presents a study of the dynamic and steady-state characteristics of such pumps. Their dynamics concern issues such as pressure fluctuations due to the dynamics of the internal mechanism and transient re-

sponse-time. Their steady-state characteristics concern limits on the operating envelope and the relationships among the operating variables. These analyses required the development of several models for this type of pump at different levels of detail. (Author abstract) 9 refs.

**087144 APPLICATION OF K<sub>h</sub>G TYPE OF ELECTRIC PUMP FOR PUMPING VISCOUS HEAT CARRIERS.** In order to widen the range of use of these electric pumps, we studied the scope of application of the 1.5KhG-3A-2.8-3 electric pump in a liquid heat supply system (LHS) working with a viscous heat carrier in the thermal zone (TZ) of an oscillating screw mixer. An analysis of the data obtained shows that, when organosilicon heat carriers are used, the period most dangerous from the point of possible failure of the electric pump is its starting period when the electric motor consumes maximum power and the heat carrier having a high viscosity and a low heat capacity at the temperature of the surroundings does not ensure effective cooling of the stator. As the temperature of the liquid being pumped rises, the parameters of the electric pump operation approach the calculated ones and reach the rated values above 110-120°C. Based on the results of these studies, a procedure was suggested. The proposed starting procedure makes it possible to widen the area of application of KhG type of electric pumps for pumping organosilicon heat carriers having a kinematic viscosity of not more than  $10^{-4}$  m<sup>2</sup>/sec and a specific heat of not less than 1.7 kJ/kg·K at the ambient temperature.

**087145 ARE PUMPS WORTHWHILE TURBINES?** Despite the extensive literature on the use of pumps as turbines, only very few well established applications using this knowledge have been reported; therefore, the lack of feedback on problems and experiences has not provided an adequate incentive to study more thoroughly the performance limitations and capabilities, and operational properties. To the authors' knowledge and experience, the application of pumps as turbines is to be recommended only for certain specific applications: where initial cost is more important than efficiency and a wider operating range; where flow is more or less constant; and where tested turbine data for the pump to be used are available. ## Axial Flow

**087146 RELATIONSHIP BETWEEN CAVITATION DEVELOPMENT AND THE VELOCITY AND PRESSURE FLUCTUATIONS OF AN AXIAL-FLOW PUMP.** The change in spectrums of velocity and casing wall pressure fluctuations due to cavitation was investigated, along with the change in the flow pattern through an axial flow impeller; analysis being carried out for a range under 10 kHz. The spectrums of pressure fluctuation measured on the impeller casing depend mainly on the tip clearance cavitation development. Levels of high frequency components over 1 kHz increase remarkably as cavitation grows, and there are no discrete components in the high frequency range. The energy of pressure fluctuation is much greater than that of velocity fluctuation under the cavitating condition. Thus, cavitation noise is concluded to be brought about by pressure fluctuations. ## 087147 EXPERIMENTAL INVESTIGATION OF

**THE PERFORMANCE OF A STIRRED AERATOR HAVING AN AXIAL FLOW PUMP IN INNER CASING.** A tested aerator considering a vertical cylindrical vessel with a coaxial inner casing, and an axial flow impeller arranged in an inner casing. As a circulatory flow is built up between the inner tube and the outer annulus, there is not any dead zone in the flow area in this new-type stirred aerator. Moreover, a high efficiency of the impeller may be expected compared with the conventional stirred vane. First, the effect of the existence of inner casing on the performance of aeration, and second, the effects of the air supply position, air flow rate, impeller speed and the diameter of air bubble on the oxygen transfer rate coefficient are studied. Moreover, the dissolution efficiency of the oxygen and the power consumption are investigated. (Edited author abstract) 4 Refs. In Japanese.

## Bearings

**087148 ON THE EFFECTIVENESS OF BrZn9-4 BRONZE THRUST BEARINGS IN HYDRAULIC PUMPS.** We study the effectiveness of hydraulic pump thrust bearings during operation in the Promgidrol P20-M2 noncombustible fluid. We determine the causes of unsatisfactory wear resistance of some bronzes, including BrZn9-4, with the use of lubricants containing glycerine. (Author abstract) 11 refs.

Bakakin, G.N.; Gavrilenko, Yu.A. *Sov J Frict Wear* v 8 n 2 1987 p 98-101.

**087149 RESIDUR - A MAINTENANCE-FREE BEARING ASSEMBLY FOR TUBULAR CASING PUMPS.** The operating environment of vertical guide bearings design used to date are presented. Several methods of bearing lubrication have been proved suitable, each with its own set of advantages and disadvantages. Aspects of wear and environmental concerns led to the development and testing of new materials. Silicon carbide appears to be the most economical solution for both the pump manufacturer and the user. Experimental research and an improved design of the bearing assembly resulted in a guide bearing whose advantages by far surpass those of previous design. The application of RESIDUR as bearing material met all expectations. (Author abstract) 4 refs.

**Components** See Also GEARS—Stresses.

**087150 EFFECT OF RIBS IN THE RADIAL FEEDLINE ON THE EXTERNAL CHARACTERISTICS OF HELICAL-CENTRIFUGAL STAGE OF PUMP.** Experimental investigations carried out showed that the feedline influences the power, cavitation, vibration, and pulsation characteristics of the stage of the pump. Ribs ('tongues') and their arrangement in the radial feedline exert significant influence on the external characteristics of helical-centrifugal stage with power-speed coefficient  $n_p = 120$ . Experiments showed that at 0.75Q<sub>opt</sub>, Q<sub>opt</sub> and 1.25Q<sub>opt</sub> ribs and their arrangement do not influence much the vibration characteristics. However vibration characteristics were significantly influenced in the 0.5Q<sub>opt</sub> regime. Back currents act on the rib. This action is transmitted to the pump body components and increases their vibrations. This assumption is supported by traces of cavitation disturbances on the rib surface detected in the tests for determining the pump life. It is concluded that the power, cavitation and vibration characteristics of the helical-centrifugal stage could be altered by varying the number of ribs and their arrangement in the radial feedline.

p 597-598.

**087151 PILOT PUMP USING THE WEIS-FOGH MECHANISM AND ITS CHARACTERISTICS.** An application of the Weis-Fogh mechanism to pumps was studied. A pilot pump was built and the characteristics were investigated experimentally, and it was shown that this mechanism works well for pumps. From the point of view of the specific speed, the characteristics of this pump are similar to those of diagonal flow pumps. The maximum efficiency was about 24%. A flow visualization about the wing was performed and clusters of vortices were found to be produced periodically in the wake. Some possibilities for raising the efficiency were discussed. (Author abstract) 11 refs. In Japanese.

## Computer Aided Design

**087152 CAD/CAM FOR PUMPS.** Factory automation is bringing engineering and manufacturing departments closer together all the time. It is therefore becoming more and more important to have a smooth, consistent, and reliable way to pass information sequentially from designers to manufacturers. Engineering and manufacturing software programs are usually designed for generic uses such as geometric modeling, computer-aided drafting, finite element modeling and analysis, numerical control machining packages, and other computer-aided engineering tasks. Yet, no CAD/CAM vendor can supply a complete package designed specifically for a company's particular product. A description is given of the use of off-the-shelf CAD software which has been combined with parametric programs to create an integrated system for the design and manufacture of centrifugal pump impellers.

## Computer Simulation

**087153 DIGITAL COMPUTER MODEL FOR PREDICTING REACTOR COOLANT PUMP BEHAVIOR.** The development of an improved model to determine the dynamic response of the primary heat transport pump during severe transients in a Canada deuterium uranium reactor is presented. A lumped parameter model is proposed. A control volume formulation is employed for centrifugal pumps. The mathematical formulation of this model is based on mass, momentum, and energy balances as well as on Euler's Theory of Turbomachines. Several constitutive relationships are adopted in the model to describe three-dimensional effects. In addition, the proposed model includes the consequent effect of different flow regimes and the slip between the two phases. Numerical results indicated that the proposed model favorably predicted the pump response and compared well with other pump-related models (Aerojet Nuclear Company) in the literature as well as in the experimental data. (Author abstract) 24 refs.

**Control** See Also PUMPS, ROTARY—Rotors; WASTE-WATER—Treatment.

**087154 PIPELINE MICROPROCESSOR CONTROL.** The traditional control scheme for a multiple pump booster system might use a suction controller, discharge controller, motor load controller, ramp function generator, signal selector, and auto-manual station. The same control scheme can be implemented using one multivariable microprocessor controller. The controller

can then be easily integrated into a CRT type distributed control system that is also handling discrete (logic) control for the other parts of the station. (Author abstract)

Williams, William J. (Yokogawa Corp of America, Peachtree City, GA, USA); Murray, Philip J. *InTech* v 35 n 2 Feb 1988 p 49-53.

**087155 ELECTRONIC CONTROLLERS FOR PUMPING APPLICATIONS.** The asynchronous cage rotor, three-phase induction motor was developed only slightly after the centrifugal pump and together they form one of the most common industrial systems. The cage rotor motor is very suitable power source for electronic controllers for pumping applications because it produces purely rational motion, with minimum vibration and a good power-to-weight ratio. It does however have one major disadvantage because its rotational speed is set by the frequency of the supply and the number of pole pairs in the winding. The motor also suffers 'slip' which means that it can never quite achieve these speeds; the slip will depend on the motor design and the load applied. The author discusses performance aspects of frequency converters. Tables are also given showing power comparisons for fixed speed and variable speed pumps. The advent of microprocessor control in frequency-converters has permitted a great range of control options to be offered integrally with the converter, including proportional control from level or flow transducers and control of both fixed-speed and variable-speed pumps from one transducer, in addition to the facility to vary the speed manually.

**087156 OPTIMAL CONTROL THEORY APPLIED TO A PUMP WITH SINGLE-STAGE ELECTROHYDRAULIC SERVOVALVE.** Optimal control theory is applied to the design of a pressure regulator for an axial piston pump and single-stage electrohydraulic valve combination. The control valve has been modeled and an optimal control law has been formulated. The time response curves due to a step input in flow rate and in current input to the servovalve have been obtained for the open loop and for the optimal control system. Comparison of the results has been made with previous work in which the supply valve to the swashplate actuators was not modeled. It is shown that controlled system modeling of the servovalve significantly improves system performance in terms of response frequency and pressure peaks. (Author abstract) 10 refs.

Akers, A. (Iowa State Univ, Ames, IA, USA); Lin, S.J. *J Dyn Syst Meas Control Trans ASME* v 110 n 2 Jun 1988 p 120-125.

**087157 PROCESS CONTROL APPLIED TO PUMP SYSTEMS.** An automatic controller is a device which compares the measured value of the process variable to be regulated (the regulating variable) with the reference value (set value) and generates a correcting variable having a certain desired time response. In case of a simple control system, the process variable could permanently deviate from the set value due to external disturbances. Contrary to this, a good automatic controller can adjust for interferences and variations of the parameters. Another benefit of an automatic controller is the ability of the regulated variable following the reference variable during process related changes of the reference variable. However, criteria such as energy conservation can also be taken into account when designing the automatic controller. (Edited author abstract) 4 refs.

## Cooling

**087158 TESTING THE VENTILATION SYSTEM OF THE DRIVING MOTOR OF A GAS-PUMPING**

**UNIT.** Based on the results of testing the ventilation system, the following conclusions are drawn: The most effective motor cooling is achieved during simultaneous operation of certain blowers. The temperature of the stator of the working motor did not exceed 72°C at cooling air pressure 1 MPa and atmospheric temperature 28°C. After normal stopping, both the rotor and stator cooled to 50°C in 2 h, 45 min, and after two successive sudden stoppages, the rotor cooled to 50°C in 1 h, 30 min. Also effective was the cooling of the motor with blowers. In this case, the motor temperature did not exceed 76°C at cooling air pressure 0.75 MPa. After stopping the unit, the motor temperature fell to 50°C in 4 h. After two successive sudden stoppages, the rotor cooled to 50°C in 1 h, 53 min at atmospheric temperature 24°C. During simultaneous working of two blowers, the stator temperature in the working motor did not exceed 74°C at cooling air pressure 0.85 MPa and atmospheric temperature 25°C. The cooling of the motor after normal stoppage required 3 h, 10 min and after two successive sudden stoppages, 2 h, 10 min. On disconnecting three blowers, the stator temperature in a working unit rose steadily.

**087160 CENTRIFUGAL VERTICAL ELECTRIC PUMP SET - TYPE 2400V-25/100.** An electric pump set has been designed for installation in the pumping stations of the Volga-Don canal and other sites. The pump is driven by a DSV 565/140-28 synchronous motor rated at 32 MW and 13.8 kv. The size of the pump made it necessary to radically change the design of the flow zone compared to type-V centrifugal pumps. The main difference include mounting of the stator behind the impeller and adopting a cast/welded design for the spiral casing. The main innovation in the pump is the fact that the steel stator is of cast/welded design and the parts of the spiral casing are welded to it. This design makes it possible to reduce the weight by 30 tons compared to standard pumps, which have a cast casing. The cast impeller has two slit-type seals. The upper band of the impeller has holes to reduce the pressure at the shaft seals and also to reduce the axial force transmitted to the thrust bearing of the motor. The shaft seals are located in the pump cover. Water is discharged from the pump through a metallic pipe equipped with a hydraulically actuated disk valve with a nominal diameter of 2800 mm. The 2400V-25/100 pump set is disassembled through the hole in the motor stator. The shaft seals and guide bearing can be repaired without removing the electric motor. The main parts of the pump are made of carbon steel. The design provides for automatic protection and control of the pump.

**087161 METHOD OF DESIGNING THE TRANSFORMING MECHANISM OF PUMPING UNITS.** The transforming mechanism of pumping units is a hinged four-link mechanism constructed on the basis of symmetric and nonsymmetric kinematic circuits. With a symmetric circuit, the center of rotation of the crank is positioned on a straight line passing through points connecting the extreme positions of joining of the rocker and the equalizer. All the other cases correspond to the nonsym-

metric circuit. In designing the mechanism with the nonsymmetric circuit it is also necessary to define the offset angle, i.e., the angle formed by the positions of the rocker corresponding to the start and end of upward strokes of the head of the equalizer. The method in which the mechanism is designed on the basis of previously specified output parameters is preferred. It is recommended that one use the parameters which determine both the type of kinematic system of the transforming mechanism and its overall dimensions: the angle of sweep of the equalizer, and the offset angle. To simplify the application of the proposed method, it is necessary to represent the required quantities in a reduced form (in fractions of stroke length). The transforming mechanism can be determined from the author's equation. 1 ref.

## Diaphragms

**087164 BEANSPRUCHUNGSSIMULATION DER PUR-MEMBRAN EINER BLUTPUMPE. (Stress Simulation in the PUR Diaphragm of a Blood Pump).** Diaphragm pumps are used in medicine to assist or replace the cardiac function. The faults which occur in pneumatic blood pumps are mainly attributable to failure of the moving parts, i.e. the valves and in particular the diaphragm. In order to obtain precise information on the time-dependent state of stress in the diaphragm, the sequence of movements of a given diaphragm geometry is simulated by means of a FEM program package. The results obtained on a Dec computer are compared with basic values determined by analysis. (Author abstract) 5 refs. In German and English.

## Diffusers

**087165 STUDIES ON DIFFUSER OF MIXED FLOW PUMP.** For the purpose of improving performance of a mixed flow pump, it is necessary to investigate not only an impeller but also a diffuser. The latter, however, has been investigated scarcely. Thus, in this report, the performance and internal flow of the mixed flow diffuser with vanes were clarified. The following conclusions were mainly derived. (1) The outlet flow angle is nearly constant under the range of the incidence angle  $-20^\circ < i_n < 0^\circ$ . (2) The pressure recovery coefficient becomes the maximum at  $i_n = 2^\circ$  approx. (3) The flow loss, however, take the minimum value at the negative incidence angle  $i_n = -20^\circ$  approx.  $-10^\circ$ , as the flow separation on the pressure surface is suppressed well by the secondary flow which runs toward its surface. (4) It is possible to predict the main flow using the presented

quasi-three-dimensional analysis, when a large separation does not occur on the vane surface. (Edited author abstract) In Japanese. 19 refs.

## Earthquake Resistance

**087167 SEISMIC RELIABILITY ANALYSIS OF VERTICAL PUMPS.** This paper deals with the evaluation of cumulative damage of the shaft of the vertical pump subjected to earthquake excitation. First, the friction force between the wearing and the impeller due to the breaking of water film is measured by experimental apparatus. Second, the fluid force between the impeller and the wearing is derived from Bernoulli's equation and is represented by a nonlinear equation containing added mass, added damping and added spring terms. Third, the equation of motion is derived and is integrated by Newmark's  $\beta$  method. Fourth, the torsional moment due to impact is calculated. Then, the maximum shear stress of the shaft is counted by both rain flow method and hysteresis loop method in order to estimate the cumulative damage, and the probability of the failure of the shaft is evaluated. (Author abstract) 6 refs. In Japanese.

**Efficiency** See Also HEAT EXCHANGERS—Cooling; PUMPS, CENTRIFUGAL—Performance.

**087168 APPLICATION OF NUMERICAL METHODS IN DEVELOPMENT OF PALMIET PUMP-TURBINE.** The efficiency of the Palmiet pump turbine was improved through the application of an integrated numerical system. The article explains the procedure used on a low speed pump turbine with a head of 300 m and output of 250 MW. Principal results of the preliminary computation are compared with model measurements. The procedure was applied to the Palmiet pumped storage plant, South Africa. 5 refs.

Klemm, D. (J.M. Voith GmbH, West Ger); Schilling, R. *S Afr Mech Eng* v 37 n 9 Sep 1987 p 436-439.

**087169 UNIQUE ASPECTS OF PUMP EFFICIENCY.** It is often much more economical to buy a more expensive pump if it has a higher efficiency. In fact, cases are known in which a difference of 1% in efficiency has proven to be equal to the cost of the pump itself. Examples show that by considering piping, operating range and mechanics, a more efficient pump may not have a lower operating cost. 4 refs.

Yedidiah, S. *Hydrocarbon Process* v 66 n 10 Oct 1987 p 37-38.

**087170 PERFECTING PUMPS.** The article reviews some recent product releases designed to help users save energy and get more out of their pumping systems. For example, the SPP Control's system uses a thermodynamic method to determine pump losses. By taking direct measurements of the head change and the temperature rise in the pumped fluid, the system is able to give efficiency readings with a repeatability on the order of one percent-

age point, depending on the differential head. Identifying pumping equipment which is working at low efficiency enables maintenance work to be carried out in a cost effective manner.

Briggs, Ray. *Process Eng (London)* v 68 n 9 Sep 1987 p 83.

**087171 PUMP EFFICIENCY MONITORING IN THE WATER INDUSTRY.** In the UK the percentage of pumping plants operating unattended is steadily increasing as more telemetry and local automatic control systems are installed. This growing trend towards automatic operation while improving operational flexibility will have the undesirable effect of increasing the number of incipient faults which remain undetected, resulting in: (1) The increased likelihood of unexpected failure or breakdown. (2) Increased incidence of inefficient pump operation. This article is concerned with the latter point and in particular the measurement of pump efficiency on site. 9 refs.

Moore, Tim (BHRA, Cranfield, Engl). *Meas Control* v 21 n 4 May 1988 p 119-122.

## Ejectors

**087172 FORCED MIXER LOBES IN EJECTOR DESIGNS.** An experimental study was conducted at Western New England College to investigate the benefits of using forced mixer lobes in low-pressure ratio, ejector/diffuser systems. The results show over a 100 percent increase in both pumping and thrust augmentation when compared with conventional ejector designs. The test results also indicate that forced mixer lobes result in nearly complete mixing in very short ejector duct lengths and allow the use of aggressive diffuser designs without resulting in stall. The testing was conducted using an existing rectangular wind tunnel at Western New England College. The pumping capabilities of an ejector/diffuser system were investigated in the wind tunnel using three forced mixer lobe contours and a free splitter. The three lobe contours included high- and low-penetration symmetrical lobes and a state-of-the-art unsymmetrical lobe designed from turbofan jet engine application. (Edited author abstract). 13 refs.

**087174 PERFORMANCE OPTIMIZATION OF INDUCTION MOTOR-PUMP SYSTEM USING PHOTOVOLTAIC ENERGY SOURCE.** The optimization of a photovoltaic pumping system based on an induction-motor-driven pump that is powered by a solar array is presented. The motor-pump subsystem is analyzed from the point of view of optimizing the power requirement of the induction motor, which has led to an optimum  $v-f$  relationship, useful in controlling the motor. The complete pumping system is implemented using a dc-dc converter, a three-phase inverter, and an induction motor-pump set. The dc-dc converter is used as a power conditioner and its duty cycle is controlled to match the load to the array. A microprocessor-based controller is used to carry out the load-matching. 5 refs.

## Impellers

**087176 CAVITATION ASPECT AND FLOW PATTERN IN AN AXIAL-FLOW IMPELLER.** The relationship between pump performance and flow pattern under cavitating conditions was investigated using an axial-flow impeller. The flow pattern at the impeller outlet shows a remarkable change due to cavitation. Change in the pump head and the shaft power curves are closely related to the extent of cavitation growth on the suction side of the blades. The change in performance curves due to cavitation is caused by the change in the theoretical pump head brought about by the change in the flow pattern rather than by an increase of impeller loss. Near the tip section, the blade element efficiency shows a marked decrease with cavitation growth. (Author abstract) In Japanese. 11 refs.

Saito, Sumio. *Nippon Kikai Gakkai Ronbunshu B Hen* v 53 n 492 Aug 1987 p 2483-2491.

**087177 FLEXIBLE ANSWER TO PUMPING PROBLEMS.** The principal attractions of the flexible impeller pump include a true self-priming operation, a gentle pumping action with sensitive products, the ability to handle both liquids and solids, from water to viscous products with almost equal efficiency and the displacement of air or gas without re-printing. In addition the flexible impeller pump is easy to maintain and replacement parts are inexpensive. Limitations in terms of pressure and temperature make it generally unsuitable for process applications but it is regarded as the ideal answer for all liquid transfer duties. The author describes the areas of application of flexible impeller pumps where its advantages are not yet fully recognized.

## Lining

**087178 POURED ANTI-FRICTION LINERS FOR RADIAL BEARINGS IN WATER PUMP BODIES.** The radial bearings used in water pumps are in short supply in the USSR. With a view to extending their useful life, the authors studied the production of steel half-shells with a poured lining of anti-friction alloy. The process consists of melting the alloy, preheating the shells in an induction furnace to the required pouring temperature, tinning the bearing surface, and pouring the babbit. The selected alloy was grade B83 babbit containing 10-12% Sb

and 5.5-6.5% Cu in a tin base.

Muinov, A.M.; Sadullaeva, T.M. *Sov Cast Technol* n 7 1987 p 79-80.

## Maintenance

**087179 CUSTOMER ACCESS KEY TO HYDRAULIC DISTRIBUTION.** In 1983, after perceiving a gap in the independent service market, Sundstrand Sauer decided to expand its existing network of authorized service centers. The existing centers located throughout North America did not provide end-user customers with a sufficiently 'close by' repair capability, the company felt. Sundstrand-Sauer established a formal program encompassing a worldwide network of distributor authorized service centers (DASCs) made up of company distributors. The program is signed both by distributor management and by Sundstrand-Sauer management. This article reviews the structure of the service center arrangement.

**087181 QUALITY AND SAFETY ARE MARKET-LED REQUIREMENTS.** IIT-Jabsco is a manufacturer of a range of pumps from flexible impeller types to lobe and drum pumps. The company has found that assured quality and safety are vital in their market. The assurance process starts in the design phase.

Anon. *Prod Eng (London)* v 66 n 10 Nov 1987 p 17-18.

**087182 DEMARCATION: HOW TO BREACH THE BARRIERS.** A 50% reduction in reworking faulty products has been achieved at Weir Pumps since the introduction of a self-inspection scheme less than a year ago. The improvement represents a drop from 10 to 5% in the time that direct labor spends bringing components into tolerance. But the benefits go beyond that, to include reduced problems in assembly and less field service work. The introduction of the self-inspection scheme completes a program, started 3 1/2 years ago, to achieve flexible working practices. It is the most recent of several ways in which the Glasgow-based company has sought to maintain its position as a leading manufacturer of pumping machinery and associated equipment. Others include investment in user-friendly CNC machine tools, the application of just-in-time manufacturing principles, and the introduction of flexible allocation of men and machines within and across product groups.

## Mathematical Models

**087184 PARAMETER SENSITIVITY ANALYSIS FOR THE DYNAMIC MODEL OF A VARIABLE DISPLACEMENT AXIAL PISTON PUMP.** Sensitivity analysis is applied to an investigation of the influence of parameters on the dynamics of a variable displacement axial piston pump. Since an exact mathematical model of piston pump is complex and highly non-linear, the investigation of its dynamic characteristics for the variation of the system parameters by changing separate parameter values in sequence becomes very ineffective. In this paper, a parameter sensitivity was employed to analyze the effects of the system parameters systematically. The analysis was done on the exact non-linear dynamic model of the pump system which is represented by fourth-order dynamics. Based upon the simulation results, the degree of each parameter and the justification of order reduction was discussed in some detail. (Author abstract) 9 refs.

**Performance** See Also COMPRESSORS—Reviews; FLOW OF FLUIDS—Viscous; FLUIDIC DEVICES—Performance; TURBOMACHINERY—Impellers.

**087189 PUMPS FOR DRILLING DEEP DRAINAGE WELLS.** A discussion is presented relative to the design and commercial production of new pumps and

improving the commercially produced borehole and deep-well drilling monoblock pumps for land reclamation purposes. Operational experience of borehole drilling pumps under vertical drainage conditions showed that the main factor affecting their reliability is the presence of suspended impurities in the water. To overcome this problem, the pumps are fitted with devices restricting the inflow of suspended impurities into the cavities of the pump and motor bearings. An outstanding feature of pumps used for vertical drainage is their low head and the small number of stages. As a rule, they have one, more rarely two, stages. It is shown that the reliability of pumps under conditions of vertical drainage should be examined with allowance for the operational conditions and the structural quality of the well.

**087190 REYNOLDS NUMBER EFFECTS ON REGENERATIVE PUMP PERFORMANCE.** Reynolds number effects on the performance of a conventional design regenerative pump were investigated, using glycerine-water mixtures, between an impeller tip speed Reynolds number,  $Re_T$ , of  $5 \times 10^3$  (all glycerine) and  $1.6 \times 10^6$  (all water). Results show that the maximum efficiency,  $\eta_m$ , can be expressed in terms of an output to loss ratio,  $\eta_m/1-\eta_m$ , which varies as  $Re_T^{0.203}$  for  $2.0 \times 10^4 < Re_T < 1.6 \times 10^6$  and as  $Re_T^{-1.156}$  for  $Re_T < 2.0 \times 10^4$ . These results are consistent with efficiency behavior reported in similar investigations on other types of turbomachines. Further, the design point flow coefficient increased over the range of Reynolds number investigated, while the design point head coefficient exhibited a maximum within this range. (Edited author abstract) 18 refs.

**087191 PERFORMANCE ANALYSIS OF A NEW CONCEPT VISCOUS PUMP.** A new concept of a viscous pump is described and the pump performance is analyzed. A linear relation is found between the flow rate and discharge pressure. Optimization of the pump geometry for maximum flow rate is presented. The potential of the new pump is demonstrated by numerical examples for general and medical applications. Finally the effect of misalignment tolerances on pump performance is discussed. It is found that under the maximum possible misalignment flow rate is reduced by no more than 30 percent and discharge pressure by less than 54 percent. (Author abstract) 12 refs.

Etsion, I. (Technion, Haifa, Isr); Yaier, R. *J Tribol Trans ASME* v 110 n 1 Jan 1988 p 93-99.

**087192 ANALYTIC MODEL FOR PUMP PERFORMANCE IN CONDENSABLE TWO-PHASE FLOWS.** A versatile model based on first principles - now incorporating condensation and compressibility effects - predicts PWR pump performance under two-phase flow conditions. Capable of replacing the largely empirical models in such codes as RETRAN and RELAP, the new model overcomes deficiencies and eliminates uncertainties of the earlier models. The analytic model identified several factors that contribute strongly to pump performance degradation under two-phase flow conditions: acceleration of liquid as it flows through blades at the impeller exit, slip velocity between the liquid and vapor phases, and void fraction. The model's numerical prediction of pump head and torque degradation compared favorably with experimental data. In addition, the model identified vapor condensation as an ameliorating factor for pump performance. (Edited author abstract)

## Pistons

**087194 RESEARCH ON A NEW TYPE OF AXIAL PISTON PUMP: AN OPEN CHANNEL AXIAL PISTON PUMP.** This paper presents a new principle for piston pumps, which possesses many advantages, such as those of being 'without a leakage line', being self-cooling and self-lubricating, and having multiway output, high pressure, high efficiency, long service life, light weight, simplicity of structure, ease of operation, and energy saving features, and it could be used to make new pumps with performances different from those of axial piston pumps now widely being used. It is proved through the test that the open channel piston pump is feasible in theory, reliable in operation and superior in performance. (Edited author abstract) 5 refs. In Chinese.

Plastics Applications See PLASTICS—Welding.

## Pressure Measurement

**087196 INTERIOR PUMP PRESSURE LOSS.** The article addresses the problem of fire departments when delivering the desired flow through a single outlet using large diameter supply hoses. The phenomenon is described using the air pressure and centrifugal pump as examples. Pressure build-up inside the pump may be the answer to the puzzle of vanishing pressure at the discharge.

Collier, Herman E. (Orlando Fire Dep, Orlando, FL, USA). *Fire Eng* v 140 n 12 Dec 1987 p 12.

## Quality Control

**087197 EXPERIENCE IN THE NONDESTRUCTIVE QUALITY CONTROL OF CAST PUMP HOUSINGS.** Several difficulties were encountered on adopting a nondestructive quality control system for thick-walled pump castings made from grade 00Kh12N3DL steel. They were inspected from the internal surface, after grinding to a surface roughness  $R_a = 6.3 \mu m$  (GOST 2789-73) for ultrasonic inspection, or  $R_a = 3.2 \mu m$  for color defectoscopy. The instruments used were type UDM-3 and DUK-66PM defectoscopes, as instructed by NPO TsNIITmash. Their sensitivities were adjusted on the basis of cast stepped specimens, after completing the entire production process along with the castings. The instrument sensitivities were additionally checked by comparison with ARD diagrams. It has been decided to use the UDM-3 defectoscope in the future, since it is more sensitive than the DUK-66PM type.

Seals See Also SEALS—Fluid Dynamics; SEALS—Materials; SEALS—Performance.

**087200 MECHANICAL SEALS IN PAPER AND PULPING.** Mechanical seal leakages are considerably less than soft-packed glands. In many cases there is no apparent leakage whatsoever and generally a leakage of 0.002 lit/h is typical. With the development of seals capable of dealing with the problems imposed by the various liquids encountered in the paper and pulp industry, the substitution of mechanical seals for soft packings offers considerable savings in energy consumption. Mechanical seals operate for a considerably longer period of time and in some applications two to three years is quite common, without maintenance.

Anon. *World Pumps* Sep 1987 p 271.

**087201 FACE SEAL WITH CIRCUMFERENTIAL PUMPING GROOVES AND RAYLEIGH-STEPS.** This paper presents an analysis of a new noncontacting pumping seal. A hydrodynamic lubricating film is maintained due to Rayleigh-steps. If the low pressure side of the seal is filled with a fluid, the fluid can be pumped into the high pressure side by pumping grooves until the shaft speed reaches a limit value. The experimental results confirm the theoretical predictions for lubrication and sealing performance. Due to the high pumping ability in addition to the high stiffness of its hydrodynamic film, the seal can operate without wear and leakage for a high pressure fluid. (Author abstract) 5 refs.

**087202 ANALYSIS OF 'RINGING' PHENOMENA IN A WATER PUMP MECHANICAL SEAL (PART II).** It was shown in previous papers that the ringing sound in a water pump seal is generated by 'stick-slip' attributed to both the lubrication characteristics of the sealing surfaces and also the torsional vibration characteristics of component parts. Later, it was found that ringing can be classified into two types of acoustic sounds. One is a higher-frequency sound caused by the torsional vibration characteristics of the rotating parts. The other is a

lower-frequency sound related to the natural frequency of the stationary parts of the seal. This paper presents an experimental analysis of the lower-frequency sound caused by the torsional vibration of the stationary parts, and the theoretical background of the higher- and lower-frequency characteristics is analyzed. **087204 EXPERIMENTAL STUDY ON THE STATIC AND DYNAMICS CHARACTERISTICS OF SCREW GROOVED SEALS.** Screw grooved annular seals are used in many heavy duty pumps such as boiler feed pumps. These annular seals have a significant effect on rotordynamics characteristics of the pumps. Studies on the dynamic characteristics of plain and circumferentially grooved annular seals have been published by many researchers. However, published works on screw grooved seals are few, and pump designers have not fully recognized the basic characteristics of screw grooved seals. Extensive experimental studies have been conducted for determining the basic characteristics of screw grooved seals. The leakage characteristics, load capacity, and dynamic characteristics for rotordynamic analysis were determined by using a specially designed test facility and test method. ## Selection

**087207 SELECTION FACTORS FOR PORTABLE PUMPS.** The most widely used portable pumps are the self-priming centrifugal, diaphragm, and submersible types. These pumps can be used in many ways: sump

pumping, dewatering construction sites, flood control, and implant transfer of corrosive viscous, or abrasive liquids. When self-priming centrifugal, diaphragm, and submersible pumps are not appropriate for the job, other options may include flexible impeller, gear, piston, plunger, progressive-cavity, peristaltic, lobe, screw and vane pumps. This article discusses pump characteristics, sample calculations, and other selection factors.

**087208 PUMP SYSTEMS & SELECTION CRITERIA FOR PUMPS.** This paper investigates the system and selection criteria for pumps. Pump duty point is a characteristic of Pump System Combination. The system resistance curve should not be too flat leading to high capital cost nor should it be too steep to cause high running cost. The pump characteristic curve should be as steep as possible but not too steep to cause maintenance problems. The pump duty point should preferably be selected left of best efficiency point, particularly when pumps are operating in parallel to ensure that the pumps always operate in the permissible operating zone. (Edited author abstract)

## Stability

**087210 EXPERIMENTAL DETERMINATION OF THE DYNAMIC TRANSFER MATRIX FOR A PUMP.** Dynamic instability in pumping systems can be the cause of a wide variety of difficulties. Analytical investigations of the dynamic behavior of such systems depend on the proper mathematical model of the dynamic performance of the pump. This paper is concerned with the experimental means and analysis procedures for obtaining the transfer matrix representing the pump as a four-pole element. Direct measurement of the pulsating flow is omitted in favor of an indirect determination utilizing multiple pressure measurements in reference pipe sections attached to the pump. The method of parameter extraction from redundant experimental data, as well as the modeling by an equivalent electrical network is shown. (Edited author abstract) 17 refs.

**087215 FOUR 18-TON SUBMERSIBLE MOTOR PUMPS FOR THE REDEEN MINE.** For a new pumping station at a depth of 900 m four submersible motor pumps, each with a driving power of 2 MW and a weight of 18 tons, were supplied to Saarbergwerke AG. This report describes the water level control system in the mine, the reason for selecting submersible motor pumps and the special problems which arose during transport and installation of the long and heavy units in the mine.

Brueck, F. *KSB Tech Ber* n 23e Mar 1988 p 53-56.

**087216 NEW SUBMERSIBLE MOTOR PUMP TYPE AMA-DRAINER.** Submersible motor pumps are used by private households, municipal authorities, fire brigades, disaster control units, as well as in agriculture, the food industry, the chemical and metal-working industry etc. It is the strict division into individual modules forming self-contained functional units which makes the standardized modular design possible at all. The entire concept meets technical requirements by providing a light weight, handy design, which can be subjected to operation conditions more severe than the previous pumps. This was proven by extensive tests on twelve test pumps in continuous duty with intermittent loading over 5000 hours each, handling a 2% silica sand-water mixture at 65°C. (Edited author abstract)

Kochanowski, W. *KSB Tech Ber* n 22e Sep 1988 p 51-56.

**087217 KEEPING A HEAD OF PRESSURE.** The article discusses various types of pumps and pump applications in tunneling projects. Pump models from different manufacturers and their applications are described. The applications discussed include drainage, concrete pumping, dewatering, mucking pumps, and others.

Lock, Jim. *Tunnels Tunnelling* v 20 n 6 Jun 1988 p

75,77-78.

## Testing

**087218 LARGE-CAPACITY PUMP TEST HOUSE.** Pumps have to be tested to verify that the pumps as manufactured would demonstrate the performance characteristics as planned at the time of design. But, when the pumps are designed to deliver flow rates of the order of 40000 m<sup>3</sup>/hr, to be driven by drives of ratings of the order of 3000 kw often drawing from HT supplies of 1.8 kv (or higher up as 7.2 kv), it all becomes a huge and elaborate project to plan and commission a pump test house to test such large-capacity pumps.

Srivastava, R.K. (Worthington Pumps (India) Ltd, Calcutta, India). *J Indian Water Works Assoc* v 19 n 4 Oct-Dec 1987 p 305-309.

**087219 TESTING STUDY ON THE NEW TYPE VAPOUR-PRESSURIZING SOLAR PUMP.** A new type of vapor-pressurized solar water pump was developed. In this paper, the operation principle of the pump and its characteristics are described and analyzed. The test method is introduced. The test results indicate good agreement between calculations and measurements. (Edited author abstract). 3 Refs. In Chinese.

Du, Zhen-kao (Nanchang Energy Saving Technology Research Inst, China). *Taiyangneng Xuebao* v 8 n 4 Oct 1987 p 373-379.

## Vacuum Applications

**087220 SCROLL VACUUM PUMP.** Scroll machines have very good sealing characteristics, and the authors have attempted to develop a scroll vacuum pump. A rotating mechanism was employed instead of an orbiting mechanism from the point of view of load pattern and mechanical simplification. The axial and the radial sealing techniques were utilized. The radial sealing mechanism is particularly easy and effective due to the stationary seal line. A spiral with zero top clearance volume and a compact Oldham coupling were the other key technologies. Vacuums of 1 Pa (10<sup>-2</sup> Torr) for dry operation, and of 10<sup>-2</sup> Pa (10<sup>-4</sup> Torr) for oil flooded operation were achieved at 1 800 rpm. (Author abstract) 4 refs. In Japanese.

**Valves** See Also PUMPS, RECIPROCATING—Wear.

**087221 MODIFICATION TO THE VALVE ON A NZHR PUMP FOR USE UP TO 3 kbar.** An improved ball valve for high pressures has been made by introducing an additional element of lenticular shape having the hardness of the ball. (Author abstract)

Polandov, I.N. (Moscow Univ, USSR); Kryukov, A.V.; Gulish, O.K.; Alekhina, N.S. *Instrum Exp Tech* v 30 n 3 pt 2 May-Jun 1987 p 740.

**087222 BALL-VALVE CONCRETE PUMPS.** More ball-valve pumps are in use than any other kind of concrete pump. Most are low-volume units with output capacities less than 30 cubic yards per hour. Although the small models are often called grout pumps, many can be used for structural concrete and shotcreting where low-volume output is suitable. They're used for repairing underwater concrete, filling fabric forms, placing concrete in heavily reinforced sections, and building bond beams for masonry walls. Some hydraulically driven models have pumped structural concrete at outputs exceeding 150 cubic yards per hour. The author explains how the ball valve works, describes pump drive mechanisms, and discusses pump safety.

Wilson, Francis C. *Concr Constr* v 33 n 2 Feb 1988 p 145-146, 148.

## Vanes

**087223 TORSIONAL FLUTTER OF GUIDE VANES IN PUMP STAGE OF PUMP-TURBINES.** This paper aims to yield a theoretical basis for the torsional flutter of guide vanes in the pump stage of pump-turbines. The guide vanes are assumed to oscillate torsionally about their axis with arbitrary intervane phase differences in the outward flow of pump stage. A theoretical analysis by the singularity method is developed for steady and unsteady flows of guide vanes under the assumption that the former is of finite order of magnitude compared with the latter of infinitely small order. Torsional flutter of guide vanes is shown to occur at low reduced frequency and for small valve opening for two intervane phase differences of  $90^\circ$  and  $270^\circ$ , and then some theoretical explanations are paid from notable features of unsteady pressure distributions and unsteady moment. (Edited author abstract) 9 refs. In Japanese.

**087224 STABILITY AND REGULATION OF A VARIABLE-DISPLACEMENT VANE-PUMP.** Pressure fluctuations may develop in the hydraulic system of automatic transmissions, even under steady-state conditions. To analyze this phenomenon, a dynamic model was developed for a system which consists of a variable-displacement vane-pump, a regulator, and a resistive load. The model was linearized and reduced to generate a stability criteria for the pressure-regulation circuit. This criteria determines a critical frequency that the natural frequency of the pressure-regulation valve must exceed to assure stability. This critical frequency depends primarily on the damping of the spool of the pressure-regulation valve and on its position; the latter is a function of the regulation-chamber leakage characteristics. (Edited author abstract) 7 refs.

**087225 CASE HISTORY OF A VIBRATION PROBLEM IN A MULTISTAGE CRYOGENIC PUMP.** Vertical multistage pumps are designed to operate with long flexible shafts and many rotating stages in series, inside of flexible casing bundles and support structures. The vibrational characteristics of these pumps are complex. Modern experimental and analytical techniques may be required to troubleshoot such pumps. This applications article describes a combined experimental and analytical approach which led to the successful resolution of the severe vibration problem of a vertical multistage liquid nitrogen pump. (Author abstract) 4 refs.

## Water Supply

**087227 VIBRATION PROBLEM OF LARGE CAPACITY PUMPS - A CASE STUDY.** Baghdad Water Supply Administration has executed Karkh Water Supply Scheme to provide drinking water to the population of over 3 million people of Baghdad City. Raw water is extracted from the River Tigris and is treated through the process of pre-settlement, clarification, filtration and disinfection. The treated water is then pumped over a distance of 40 kms through twin DI pipelines 2100/2300 dia from Treated Water Pumping Station to Reservoirs. The pumps for the TWPS for the 1st Stage of the Stream were commissioned in July 1985. On running of these pumps, excessive vibrations were noticed. This Paper brings to focus the phenomenon of vibration, its analysis and remedies effected to solve the problem.

## Wear Resisting

**087230 RAISING THE RESISTANCE OF MAINLINE PUMP PARTS TO HYDRAULIC ABRASION.** The surfaces of the working impellers, housings, and gasket recesses of mainline petroleum pumps are exposed to intensive wear from the abrasive action of the medium being pumped. In the interest of extending the service life of NM 2500×230 mainline pumps, we have performed experiments on reinforcing their gaskets and operating rotors with powdered mixtures based on boron carbide. It is shown that as the saturation temperature is raised from 900 to 1070°C, the content of graphite inclusions between the boridized layer and the base metal rises, and their cohesive strength drops as a result. The experimental results were confirmed by industrial tests on an NM 2500×230 centrifugal pump whose parts had been subjected to diffuse boridization; the pump's service life was raised by a factor of 2 to 2.5. Diffuse boridization in power mixtures has been put into production as a technological process. 3 refs.

## Welding

**087231 WELDING OF CRITICAL COOLANT PUMP COMPONENT - AN EXPERIENCE.** The welds in construction of components are required to pass various quality control tests almost ensuring zero defect level. Weldment as a whole also has to meet the critical dimensional requirements. Welding of one such component, the coolant pump shaft is discussed here. The results obtained on the job exceeded the expectations of all concerned. The experience of handling such jobs can induce more confidence in Indian equipment manufactur-

ers. The specifications involved may appear to be made with greater emphasis on safety, partly due to the cautious approach on part of makers of specifications.

**087232 KREISELPUMPEN FUER RAUCHGAS-ENTSCHWEFELUNGSANLAGEN NACH KALKWASCHVERFAHREN.** [Centrifugal Pumps for Flue Gas Desulfurization Plants with Limestone Scrubbing Systems]. For the desulfurization of large power stations, flue gas desulfurization plants which apply limestone scrubbing systems are almost exclusively used. These plants make special demands on the scrubbing pumps which are needed for circulation of the chemically aggressive and mechanically wearing scrubbing suspension. In order to reach the required service life of at least 16000 operational hours, importance is attached to the hydraulic design, structural configuration and the selection of suitable corrosion- and wear-resistant materials. The article discusses materials of pump construction. In German. 7 refs.

Kratzer, A. *Brennst Waerme Kraft* v 39 n 1-2 Jan-Feb 1987 p 37-41.

**087233 NEW MARKET FOR CENTRIFUGAL PUMPS.** The author has outlined the present 'state of play' regarding the role of centrifugal pumps in modern industrial processes. The main factors affecting pump performance are discussed. Centrifugal and positive displacement pumps are compared. A discussion is also presented of the two major markets: the oil and gas industry and biotechnology. 6 refs.

Hughes, Simon (BHRA, Cranfield, Engl). *Chem Eng (London)* n 436 May 1987 p 40-42.

**087234 EFFECTS OF EXTERNAL MAGNETIC-FIELD PATTERNS ON THE CHARACTERISTICS OF A CENTRIFUGAL CONDUCTION PUMP.** It is usually assumed that the external magnetic field is homogeneous in research on unclosed MHD rotations in cells of a centrifugal conduction pump (CCP). In a real CCP, the constraints on the dimensions of the electromagnet mean that the magnetic field is usually very inhomogeneous, and that inhomogeneity can, in particular, be used to control the MHD flow, although so far no study of such effects has been made. We examine the effects of an axisymmetric external-field distribution. We also give measurements. 2 refs.

## Analysis

**087235 METHOD OF APPROXIMATE CALCULATION OF THE CHARACTERISTICS OF A CENTRIFUGAL CONDUCTION PUMP IN A NONZERO DISCHARGE REGIME.** Along with experimental and theoretical investigations of the internal structures of flows in cells of the centrifugal conduction pump (CCP) type the development of engineering methods of calculating the integral characteristics of a CCP is of interest. However, in connection with the turbulent character of the flow metal in the cell it is usually necessary to use empirically determined constants. An approximate method is proposed in this work for calculating the characteristics of a CCP in regimes with a large discharge, in which eddy viscosity is not considered and thereby empirical constants are not used. 4 refs.

Blades See DRAINAGE—Pumping Plants.

## Cavitation

**087236 DETECTION OF CAVITATION EROSION IN CENTRIFUGAL PUMPS.** This paper presents a method in which the minimum NPSH that a centrifugal pump can operate without risks of erosion can be deduced. It has been recognized that cavitation erosion can only be induced when vapor bubbles collapse near the boundary concerned. Presented in this paper are the results of experiments carried out on a centrifugal impeller in a closed circuit, which show that below the critical NPSH the erosion rate first increases, then decreases, and finally increases for a decreasing NPSH. (Author abstract) 4 refs.

Chan, W.K. (Nanyang Technological Inst, Singapore). *Int J Heat Fluid Flow* v 9 n 1 Mar 1988 p 74-77.

**087237 CAVITATION-EROSION IN CENTRIFUGAL PUMPS.** Cavitation is a complex phenomenon which is dependent on a multiplicity of physical parameters. In spite of intensive, world-wide research, material loss rates brought about by cavitation-erosion in pumps have not, up to the present, been calculated in advance to any useful extent. However, Sulzer has obtained good results through the systematic evaluation of experience gained from actual installations, coupled with a new calculation method. (Author abstract) 10 refs.

Gulich, J.F.; Rosch, A. *Sulzer Tech Rev* v 70 1 1988 p 28-32.

**087238 CAVITATION STUDIES OF CENTRIFUGAL PUMPS.** This presentation relates to the cavitation studies on centrifugal pumps wherein loss of performance and noise and vibration effects were evaluated experimentally together with visual observations. The details of the five experimental pumps (designated as IMP0, IMP1, IMP2, IMP3 and IMP4) employed for the investigation are presented together with typical results obtained. The 5 pumps were obtained by changing the impeller alone in the same casing. IMP0 was designed for a different set of data compared to the other impellers. IMP1, IMP2 and IMP3 have the same dimensions but have different number of vanes. IMP4, designed for the same data as that of IMP1, IMP2 and IMP3, has a different geometry. First, the cavitation-free performance of the five pumps were determined at various speeds. The points of optimum efficiency were then found out. 4 refs.

Kumaraswamy, S. (Indian Inst of Technology, Madras, India); Radha Krishna, H.C. *Irrig Power* v 45 n 1 Jan 1988 p 99-116.

## Control

**087239 PENNY WISE OR PUMP FOOLISH?** There are two ways to adjust the output of a centrifugal pump or fan. One can install a throttling device to vary the amount of flow, or one can control the speed of the impeller with an adjustable-speed drive. It is shown why it is more economical in the long run to install a variable speed drive instead of a cheap throttling device. The variable speed drive saves energy. Examples of calculations are given.

## 087241 CENTRIFUGAL PUMPS FOR FLUE-GAS

**DESULPHURIZATION PLANTS USING THE LIME WASHING PROCESS.** Flue gas desulfurization large scale power stations is an aggressive and abrasive process. The author describes the demands made on scrubber pumps that influence their selection and the choice of materials of construction. (Author abstract) 8 refs.

Kratzer, A. (Klein Schanzlin & Becker AG). *World Pumps* n 11 Nov 1987 p 363-367.

## Design

**087242 PUMP BYPASSES. NOW MORE IMPORTANT.** Discoveries during the past two decades show that it is important to install automatic bypasses on many large centrifugal pumps. The advantages of utilization of bypasses are covered. Other topics discussed include stable pumping, bypass flow, and stable fluid flow. 12 refs.

Taylor, Irving (Bechtel Inc). *Chem Eng (New York)* v 94 n 7 May 11 1987 p 53-57.

**087243 CENTRIFUGAL PUMP WITH MAGNETIC COUPLING: NEW MATERIALS OPEN NEW MARKETS.** The use of bearing materials of great hardness, wear resistance and particularly good corrosion resistance as well as new magnetic materials make it possible for designers to advance the design features of glandless centrifugal pumps with permanent magnetic synchronous couplings for use by the chemical industry, with absolute operational reliability and long service life ranging among priorities. (Author abstract)

Anon. *Chem Ind Int (Engl Transl)* n 2 1987 p 30-33.

## Impellers

**087244 UNSTEADINESS OF PRESSURE DISTRIBUTION AND CAVITATION INCEPTION ON THE IMPELLER BLADES OF A CENTRIFUGAL PUMP.** Pressure distribution and cavitation inception near the inlet region of an impeller passage of a centrifugal pump were examined experimentally. Both at flow rates lower and higher than normal, the pressures on the blade surface of the impeller fluctuated nearly periodically with its circumferential position due to the non-uniform pressure distribution in the volute and the presence of the dividing ridge of the volute. From the measured pressure distributions on the blade surface at a fixed circumferential position, the pressure fluctuations were also found to be caused, especially at low flow rates, by turbulent fluctuations including the separation of flow from the blade surfaces. The quasi-periodic changes in the pressure distribution caused circumferential non-uniformity of the cavitation occurrence near the cavitation inception. (Edited author abstract) In Japanese. 5 refs.

**087245 ANALYSES OF HYDRODYNAMIC RADIAL FORCES ON CENTRIFUGAL PUMP IMPELLERS.** Hydrodynamic interactions that occur between a centrifugal pump impeller and a volute are experimentally and theoretically investigated. The theoretical analysis considers the inability of the blades to perfectly guide the flow through the impeller, and also includes a quasi-one dimensional treatment of flow in the volute. Flow disturbances at the impeller discharge and the resulting forces are determined by the theoretical model. The model is then extended to obtain the hydrodynamic force perturbations that are caused by the impeller whirling eccentrically in the volute. Under many operating conditions, these force perturbations were found to be destabilizing. Comparisons are made between the theoretical model and the experimental measurements of pressure distributions and radial forces on the impeller. (Edited author abstract) 17 refs.

Adkins, D.R. (California Inst of Technology, Pasadena, CA, USA); Brennen, C.E. *J Fluids Eng Trans ASME* v 110 n 1 Mar 1988 p 20-28.

**087246 FLOW OF CAVITATION BUBBLES IN A CENTRIFUGAL PUMP IMPELLER.** To obtain the behavior of cavitation bubbles in a radial-flow impeller pump, the equation of motion of a bubble and the Rayleigh equation expressing the change in the bubble diameter are solved simultaneously based on the flow field calculated numerically by a three-dimensional finite element method for an idealized potential flow. And the effects of suction pressure, the size of bubble, and discharge rate of water are discussed. When the bubble is in the range of pressure lower than the critical one, it grows abruptly, and the trajectories of the bubble shift toward the shroud surface and the direction of impeller rotation. In such ranges, the cavitation bubbles grow to a visible size. When the discharge rate of water becomes larger, the shift of bubble trajectories is intensified. (Author abstract) 11 refs.

**087247 FLOW ANALYSIS IN TWO-DIMENSIONAL IMPELLER OF CENTRIFUGAL PUMP BY THE SURFACE SINGULARITY METHOD COMBINED WITH A FLOW-MODEL OF THREE-DIMENSIONAL BOUNDARY LAYER.** An iterative solution method has been developed for calculating flows in two-dimensional centrifugal pump impellers. The method was formed by combining an integral calculation method for a three-dimensional boundary layer on the whole channel wall with a surface singularity method for a two-dimensional inviscid core-flow. In the inviscid analysis, the blade shape and the area of flow passage were modified by calculated displacement thickness of boundary layer, and then a finite number of vortices were distributed on the modified blade surfaces with the Kutta condition at the outlet edge on the suction surface. This method was applied to flows in two impellers with different blade thicknesses. (Edited author abstract) In Japanese. 15 refs.

Furukawa, Akinori; Cheng, Ci-Chang; Sekiya, Takakichi; Takamatsu, Yasuo. *Nippon Kikai Gakkai Ronbunshu B Hen* v 53 n 494 Oct 1987 p 3038-3043.

**087248 USE OF TWO-LEVEL IMPELLERS IN PUMP CONSTRUCTION.** It is known that an increase in efficiency and other indicators of centrifugal pumps is based on developing and optimizing the flow-through part, mostly the impeller. Only one-level impellers have been used so far in pump construction. An important stage in impeller design is selection of the number of blades, which significantly affects both the structure of the stream and the characteristics of the impeller. The authors demonstrated the possibility of using two-level blading in tradition pump impellers with an output angle to 30°. In terms of efficiency and cavitation properties stages with two-level impellers with rational selection of the length, number and distribution of the blades of the second level are not inferior to (and even surpass) the better versions of one-level impellers. 8 refs.

## Measurements

**087249 MEASUREMENTS ON THE VOLUTE CASING OF A CENTRIFUGAL PUMP.** The volute casing often employed in the design of centrifugal pumps, with its function of post-guidance and collecting space, is a simple and inexpensive component which at the same time renders high efficiencies possible. This article reports on measurements taken on a slow-running volute casing pump. Comparisons are made with earlier measurements on another test pump, described in the references. Both values were designed by the 'stagnation point' method and were provided with variable tongue thicknesses. The results confirm the reliability of this approach to the design for casing tongues of any thickness. 10 refs.

Medical Applications See BIOMEDICAL ENGINEERING—Cardiology.

## Packing

**087250 INFLUENCE OF LEAKAGE FLOW ON PRIMARY FLOW AHEAD OF CENTRIFUGAL PUMP OR COMPRESSOR ROTOR.** The stage scheme is widely used in multistage centrifugal pumps and compressors. In the literature there are no analytic relations connecting the shift of the shroud disk with the characteristic parameters of the centrifugal stage and reliability ensuring the indicated positive effect. The purpose of the present work is to obtain the relations. 4 refs.

Evgen'ev, S.S. *Sov Aeronaut* v 30 n 4 1987 p 94-96.

Performance See Also PUMPS—Diffusers.

**087251 SLIP FACTORS OF CENTRIFUGAL SLURRY PUMPS.** Experiments have been carried out in order to determine the effects on slip factor due to the various parameters affecting the performance characteristics of a centrifugal slurry pump. The experiments were conducted with water, sand slurry, and a glass bead slurry at three different pump speeds. Measurements of power, flow rate, head developed by the pump and the density of the slurry were made in order to obtain the characteristic curves of the pump. Using Euler's equation, equations were derived for calculating the slip and friction factors of the flow. The deduced slip factors for centrifugal slurry pump can be correlated well with suggested non dimensional groups. It shows a consistent trend of decreasing slip factor with increasing slurry mixture density and impeller rotation, or with a decreasing through flow rate. (Edited author abstract) 9 refs.

Sheth, K.K. (Centrifl-Huges, Claremore, OK, USA); Morrison, G.L.; Peng, W.W. *J Fluids Eng Trans ASME* v 109 n 3 Sep 1987 p 313-318.

**087252 EVALUATION OF FAILURE-FREE PERFORMANCE OF CENTRIFUGAL PUMPS.** The search for methods to increase efficiency and reliability of power generating machines and pump equipment, in particular, in all stages of development and operation, is of considerable practical importance. Centrifugal pumps (CP), requiring the functional characteristic of reliability, form a significant part of pump equipment. Reliability stems from failure-free operation, suitability for repair, lifetime and keeping quality of components. This article examines the question of obtaining quantitative indicators of failure-free operation of CP in the circulation systems for cooling of motors, diesel generators which serve low-potential steam boilers, desalinization units, and for pumping oil and its products. 3 refs.

Bashurov, B.P. *Sov Energy Technol* n 1 1987 p 31-35.

**087253 SELECTION OF OPTIMAL CONDITIONS FOR CENTRIFUGAL-PUMP OPERATION.** The authors determine the position of the optimal operating regime of a centrifugal pump for which the minimum value is attained for the total power required by pumps of any make. The assumptions used are outlined. To determine the desired position of the optimal regime, the authors express the pump's efficiency as a function of its operating regime. The results of computations of the total power required by all pumps for different optimal-regime positions. The saving in electric energy due to the shift in the optimal-regime position over the rated time to overhaul (20,000 h) is 1,168,000 kWh. Calculating the entire pump-discharge program, the saving in electric energy increases proportionally. 2 refs.

**087254 EFFECT OF SOME ELEMENTS OF BLADE OUTLETS ON CHARACTERISTICS OF**

**CENTRIFUGAL PUMPS AND NATURE OF BOTTOM FLOW LINES.** The paper describes the results of an experimental examination of blade outlets in centrifugal pumps. It has been shown that reducing the number of channels in the guide apparatus from 8 to 6 enables one to eliminate a drop in the pressure characteristics of a pump with  $n_0 = 85$  at deliveries  $Q = (0.6 \div 0.8) Q_{opt}$ . The paper presents visually obtained traces of flow bottom lines whose nature reveals the fact that a considerable part of area at the inlet portion of the reverse channels is occupied by a vortex pushing the flow towards the concave side of the blade outlet. (Author abstract) In Russian. 3 refs.

Borshchev, I.O.; Zharkovskii, A.A.; Pleshanov, V.L.; Shkarbul, S.N. *Tr Leningradskii Politekh Inst im M I Kalinina* n 420 1986 p 39-43.

**087255 CONTROLLING THE OUTPUT OF CENTRIFUGAL PUMPS BY MEANS OF ELECTRONIC SPEED CONTROL.** Among many methods of controlling centrifugal pump output variable speed is the most economical. Operation and performance of variable speed electric motors, in particular the asynchronous motor, are described. A change in rotor circuit resistance or stator voltage will affect the rotor slip or speed of the rotor. Frequency control is even more economical using current or voltage inverters, the latter with pulse width modulation or pulse amplitude modulation. Pumping stations typically need to meet a set value curve of demand correlation between pressure increase and flow rate. In simple cases a fixed value set suffices. By example of a water supply station, a pressure booster unit and a recirculation system the use of speed control and the effects on operation and energy consumption are demonstrated. Trends of future developments in controls and monitoring technology are provided. (Author abstract) 16 refs.

## Pressure Measurement

**087257 EXPERIMENTAL INVESTIGATION OF PRESSURE OSCILLATIONS OF LIQUID IN A CIRCULATION LOOP WITH OPERATION OF A CENTRIFUGAL PUMP.** The work described in this paper was devoted to experimental investigation of oscillating processes of single-phase flow of liquid in the circulation loop of a hydraulic rig, the arrangement of which is shown. The rig consisted of pipeline 1 of internal diameter 0.125 m, connected with tank 2 open to the atmosphere, centrifugal pump 3 of type 4NDV with an impeller having eight vanes and running at a speed of 2930 rev/min, and three valves 4, 5 and 6. Pipeline 1, with overall length of 30 m, has two straight sections each 6.5 m long, connected by a bend of radius 0.5 m. Pump 3 is mounted on fixed support and is connected to pipeline 1 via expansion joints. Pipeline 1 is fixed to rigid supports. Water flowrate is set by valve 6, valves 4 and 5 being fully open. 4 refs.

## Seals

**087258 HYDRODYNAMIC STIFFNESS OF CONTACTLESS SEALS.** The efficiency of rotating machines, in particular centrifugal pumps, depends significantly on their sealing units, that is on the influence of the hydrodynamic forces of the seals acting on the rotor. Incorrect choice of the construction of the seals of the flow-through section can lead to increased vibration of the machines. The objective of the tests to be described is to determine and compare the coefficients of hydrodynamic stiffness and flow characteristics of honeycomb, pitted-surface, labyrinth and smooth-gap seals. The results are summarized. 5 refs.

## PUMPS, ELECTROMAGNETIC

## Analysis

**087262 COMPUTATIONAL METHOD FOR CYLINDRICAL INDUCTION MHD PUMPS IN THE ELECTRODYNAMIC APPROXIMATION.** In solving the problem of synthesis of an electrically short cylindrical pump it is necessary to employ design solutions that have not received wide dissemination in practice. In particular, it is possible to use a nontraditional structure of the magnetic conductor containing winding coils and a nonmagnetic gap with a liquid metal working medium. In the present work a mathematical model is used which makes it possible in a single algorithm to take into account the major known means for reducing the negative influence of the end effect. Addressing this requirement is the internal problem of the end effect in the small nonmagnetic gap approximation. Since an analytical approach does not make it possible within the framework of a single algorithm to account for the variety of design solutions, preference has been given to the numerical finite difference method. 10 refs.

## Liquid Metals

**087263 LOCAL CHARACTERISTICS OF A CYLINDRICAL INDUCTION PUMP FOR  $Rm \gg 1$ .** Experiments, which thus far were performed on commercial electromagnetic pumps, did not permit studying the evolution of the velocity profile along the machine and establishing the effect of the characteristic parameters of the MHD interaction process on it. In addition, because of the peculiarities of the construction the indicated pumps had 'external' nonuniformities (nonuniform velocity profile at the inlet and nonuniform nonmagnetic gap), which contributed to the formation of a nonuniform velocity profile in the active zone. The problem addressed in this study is to clarify the above-mentioned dependences for maximum possible elimination of 'external' nonuniformities. 11 refs.

## Vibrations

**087266 SELF-EXCITED OSCILLATIONS IN AN INDUCTION MHD DRIVE.** Low-frequency oscillations of the flow rate, current, and pressure, which can be a significant amplitude, were recently discovered in a study of the operation of powerful induction MHD pumps. In studying self-excited oscillations in an induction MHD drive (IMHDD), one cannot neglect the fact that the source of generation is the entire nonlinear system containing the MHD pump and a pneumohydraulic load. Because it contains a significant volume of gas, potential energy can accumulate in the loop, which for a certain form of the  $p(Q)$  characteristic of the pump can lead to pumpage oscillations. In this paper we investigate the stability of a dynamic system consisting of an MHD pump and external pneumohydraulic circuit with lumped parameters. 13 refs.

## Noise, Acoustic

**087270 OBCIAZENIA DYNAMICZNE W POMPIE ZEBATEJ O ZAZEBIENIU ZEWNETRZNYM.** [Dynamic Loads in a Gear Pump with External Gear Wheels]. It is established that with an increase in the rotational

speed of a gear pump with external gear wheels, there is an increase in the fluctuation amplitude of the dynamic torque on the pump shaft and in the dynamic loading amplitude on the gear wheels. The lower the forcing pressure, the faster the increase in the dynamic loads in the pump occurs. The dynamic load on the gear wheels is transmitted via the bearings to the pump housing. It may then be concluded that an increase in the dynamic load on the gear wheels with an increase in the rotational speed is one of the causes of an increase in the noise level of the pump. In Polish. 4 refs.

## PUMPS, JET See Also SHIP PROPULSION.

**087271 MECHANISM AND CALCULATION THEORY OF JET PUMP CAVITATION.** An analysis of the three stages in the mechanism of jet pump cavitation shows that jet pump cavitation depends on fluid pressure and on the varying characteristics of the turbulent jet boundary layer. The maximum suction flow rate is described in an all-round way. On the basis of this new concept, by using the theory of fluid mechanics is combination with the characteristics of turbulent jets, a set of equations for jet pump cavitation and simplified formulas for it are derived. Numerical solutions have been obtained over computers and verified by experimental results. (Edited author abstract) 13 refs.

## Applications

**087272 WATER JET PUMPS FOR TRANSPORTING SOLID MATERIALS (1ST REPORT, 90° BEND WITH A JET NOZZLE).** The experiments on the newly-developed water jet pumps, which have jet nozzles outside of water transporting pipes, show the practical usefulness for the water transportation of solid materials. The tested water jet pumps are (1) a 90° bend connected directly with a water jet nozzle, (2) a 30° elbow with a water jet nozzle and (3) a straight pipe with a conical jet nozzle. From the experiments on the 90° bend connected directly with the water jet nozzle at various positions, it is shown that the 90° bend connected directly with the water jet nozzle along the centerline has the same characteristics as the previously used water jet pumps, which have jet nozzles inside of water transporting pipes. ## Marine Applications

**087274 PROPULSION CONCEPT FOR SHALLOW-DRAUGHT VESSELS BY SCHOTTEL.** A strong demand for shallow water propulsion systems for low draught craft resulted in the development of the Schottel Pump-Jet system. The Schottel Pump-Jet consists of a semi-axial centrifugal pump with spiral housing ending in a nozzle. The pump draws water from underneath the craft and ejects it at an inclination of 15 degrees from a duct in the bottom of the vessel producing a

propulsion reaction in opposite direction. Since the installation of the first system a great deal of experience has been gained and at present there are eight different models of Pump-Jets available covering an output range between 60 and 400 kW and operating in a wide variety of applications.

## Performance

**087275 STUDIES OF THE CONFIGURATION AND PERFORMANCE OF ANNULAR TYPE JET PUMPS.** In this paper, we investigated experimentally the relation between configuration and performance of the annular type jet pump and compared it with that of the central jet type. Twenty-five different kinds of pumps were used in the experiments. These pumps reached a maximum efficiency of thirty-six percent. This corresponds with that of the conventional central jet type pump. We also studied the effect of the swirl component in the driving jet, and compared it with the result without swirl component. **087276 STUDIES ON THE OPTIMUM THROAT LENGTH OF JET PUMPS.** In order to improve jet-pump-performance, in this paper, the turbulent flow through a jet-pump-throat was carefully analyzed by using a simple flow model, and the results were compared with experiments on jet pumps from 8.3 to 100 mm in diameter  $d_t$ . The optimum throat length,  $l_{23opt}/d_t$ , was simply shown by  $l_{23opt}/d_t = A \log Re + B$  where  $A$ , and  $B$  are constants and  $Re$  is Reynolds number. We also found a superior pump with 40 percent of the maximum efficiency. (Author abstract) In Japanese. 14 refs.

Oshima, Ryoichiro. *Nippon Kikai Gakkai Ronbunshu B Hen* v 54 n 497 Jan 1988 p 125-129.

**087277 PERFORMANCE AND MODELING OF LIQUID JET GAS PUMPS.** This paper reports an experimental and theoretical study of a two-phase jet pump, involving a liquid primary flow and a gas secondary one. The ultimate objective was to produce a mathematical model and computer program for use with microcomputers in the industrial design of such gas pumps, the experimental phase of the project being required to produce empirical values for some of the variables used in the computer program. The major advance has been the ability of the mathematical model to predict performance under almost any operating conditions. (Edited author abstract) 7 refs.

## Piping Systems

**087281 PRESSURE PULSATIONS IN THE PIPING OF RECIPROCATING PUMPS.** Pressure pulsations in hydraulic systems, generated by reciprocating pumps, can cause serious problems with regard to plant safety and reliability. In particular, fatigue problems arise in high-pressure piping systems. The available knowledge is not sufficient for an accurate computation of pressure peaks in the piping of reciprocating pumps. A number of calculation models are available which, however, neglect both fluid compressibility and friction. This contribution presents a calculation method which allows a precise modeling of various pump installations. Comparison of calculated and experimental data shows a good agreement and provides a validation of the computational model. (Author abstract) 16 refs.

## Wear

**087282 PRACTICAL INVESTIGATION OF WEAR IN PISTON PUMPS OPERATED WITH HFA FLUIDS WITH DIFFERENT ADDITIVES.** This paper examines the use of water-based hydraulic fluids in hydraulic pumps. Four different types of HFA fluid are reviewed in terms of properties and usage. In a research program, two principal fluids, a HFA micro emulsion and a HFA solution, were evaluated in relation to their wear protection capability in a short-term test procedure, and their operational behavior and confirmation of the short-term test procedure in a long-term test. The differences between the fluids are mainly in terms of wear of the test pumps. It is concluded that a performance standard similar to oil-based fluids has not yet been reached. (Author abstract) 7 refs.

## Computer Aided Design

**087285 MIXING AND MATCHING MODULAR PUMPS: THE CAD APPROACH.** In a move to get a more broadly specified range of pumps, manufacturers are turning to modular designs. The modular approach will allow customers match their applications more closely instead of getting the pump from a standard range which may not exactly meet the pumping capacity or energy consumption requirements. In addition, the modular approach will benefit users whose process requirements change.

Chynoweth, Emma. *Process Eng (London)* v 68 n 9 Sep 1987 p 77, 79.

## Design

**087286 DESIGN OF FZ CORROSION-RESISTING ROTOR PUMP.** The FZ series pumps are new-structure corrosion-resisting rotor pumps in the category of volume pumps. A pump consists of the pump body, the rubber seal ring, the compression ring and the front and rear covers. The pump body and rubber ring compose an entirely closed liquid cabinet. When the rotor is turning outside the liquid cabinet, the rubber seal ring is forced to change its shape and makes the liquid cabinet larger or smaller so that the liquid will be sucked in or discharged. The design calculation of the performance parameter for the pump is demonstrated in detail. (Author abstract) 3 refs. In Chinese.

## Marine Applications

**087289 DESIGN AND OPERATION OF PUMPS FURNISHED FOR MARINE CARGO SERVICE: PART II.** To a pump manufacturer, marine cargo service represents one of the most demanding applications for which he can design and furnish equipment. In addition to being subjected to the stresses encountered in a shipboard environment, cargo pumps must often perform over a wide range of operating conditions and handle multiple fluids with different viscosities, vapor pressures, specific gravities, temperatures, and material requirements. In this paper the author reviews characteristics of the different types of pumps used for marine cargo service, with an emphasis on the special features that should be incorporated into their design for this rigorous duty. Different types of automatic self-priming/stripping systems available for use with these cargo pumps are also examined. Pump operation is discussed, including the significant impact that system design has on proper pump performance. (Author abstract) 26 refs.

## Service Life

**087290 INVESTIGATION INTO THE WEAR RESISTANCE OF PUMP TRANSMISSION SHAFTS.** The reliability and service life of artesian turbine pumps which supply water from a depth of 100-150 m are influenced mainly by the quality of the transmission shafts. Water, which is an aggressive medium, with particles of salts and sand suspended in it, contributes to the rate of wear. This article examines the results of an investigation and the possibility of increasing the wear resistance of pump transmission shafts by changing the parameters of the sizing operation used for their manufacture from round rolled steel. 7 refs.

### Electrochemistry

**087292 ELECTROCHEMICAL BEHAVIOR OF PYRITE IN SULFURIC ACID SOLUTIONS CONTAINING SILVER IONS.** A systematic electrochemical study of pyrite in  $H_2SO_4$  solutions containing dissolved silver was undertaken to gain more information about the transfer of silver ions to pyrite and their role in enhancing the direct oxidation of pyrite. The results of cyclic voltammetry experiments provide additional evidence of the formation of metallic silver on the  $FeS_2$  surface under open-circuit conditions. A pyrite electrode held at the open-circuit potential for 2h in the presence of  $10^{-3}$  M  $Ag^+$  exhibits a large and sharp anodic peak at about 0.7 V. The current associated with this peak is the result of the dissolution of metallic silver deposited during the initial conditioning period. (Edited author abstract) 24 refs.

### Flotation

**087293 EFFECT OF SEMI-CONDUCTIVITY ON THE FLOTABILITY OF PYRITE.** This paper deals with the flotation behavior of pyrites from three different types of mineral deposits in the presence of different modifiers and an investigation of the effect of semi-conductivity on the flotability of pyrite. From the results of flotation experiments with the Hallimond tube and nitrogenated techniques, it is shown that under the conditions of suitable concentration of butyl xanthate and with  $NaOH$ ,  $CaO$ ,  $FeSO_4$ ,  $FeCl_3$ ,  $Na_2SO_3$ , and  $CuSO_4$  as modifiers, the flotabilities of pyrites are closely related to their semi-conductivities. In this work, a simple working model is established in terms of which differences in the flotation properties may be well illustrated by the influence of their semi-conductivities on the kinetics of electrochemical processes of the formation of dixanthogen on the pyrite surface or on anionic xanthate adsorption. (Edited author abstract) In Chinese. 14 refs.

**087294 ELECTROCHEMICAL CHARACTERIZATION OF PYRITES FROM COAL AND ORE SOURCES.** A preliminary investigation of the electrochemical behavior of pyrite samples from an ore and a coal source in alkaline borate solutions (pH 9.3) has been carried out by cyclic voltammetry, steady state polarization, and AC impedance measurements. Voltammetry and impedance results indicate that a product layer is initially formed on the ore pyrite during sample preparation. Such a layer is absent from the surface of the coal pyrite. Results of the steady state polarization and AC impedance techniques show that, under similar oxidizing conditions, coal pyrite begins to oxidize at potentials lower than the ore pyrite. The large difference in charge transfer resistance determined by the AC impedance measurements, shows that this technique is very sensitive for measuring reactivities of minerals. (Author abstract). 11 refs.

**Oxidation** See Also CONCRETE PRODUCTS—Slabs; MINES AND MINING—Wastes.

**087296 PASSIVATION OF PYRITE OXIDATION WITH METAL CATIONS.** Under the influence of anodic potentials greater than 0.5 V against SCE (saturated calomel electrode), pyrite slurred in acidic electrolytes is oxidized to water soluble ferric and sulfate ions. Experiments were conducted in a stirred Pyrex reactor provided with three electrodes, the anode being a platinum mesh. The rate of reaction of pyrite corrosion was observed to increase with electrolysis time. The autocatalytic reaction is brought about by the ferric ions produced during the course of the reaction. The rates of reaction, however, can be depressed by adding small quantities of copper and silver ions (both of these have lower redox potentials than that of the  $Fe^{2+}/Fe^{3+}$  couple) to the electrolyte. (Edited author abstract) 17 refs.

Lalvani, Shashi B. (Southern Illinois Univ at Carbondale, Carbondale, IL, USA); Shami, M. *J Mater Sci* v 22 n 10 Oct 1987 p 3503-3507.

**087297 KINETIC STUDY OF OXIDATION OF PYRITE SLURRY BY FERRIC CHLORIDE.** The aqueous oxidation of pulverized pyrite by ferric ion was investigated in a concentrated, acidic chloride solution. The ratio of the concentration of sulfate ion to elemental sulfur produced during the reaction was approximately 1.3, regardless of the leaching conditions such as temperature and acid concentration. The oxidation rate increased with decreasing acid concentration and increasing initial ferric chloride concentration and was retarded by an addition of ferrous ion. It was also found that the oxidation rate was not linearly related to the pyrite loading and the reciprocal of the particle diameter. A kinetic model was proposed assuming that fine mineral powder and irregular pits on the outer surface of the crushed pyrite are responsible for the high initial reaction rates. (Edited author abstract) 12 refs.

Kawakami, Koei (Kyushu Univ, Fukuoka, Jpn); Sato, Junko; Kusunoki, Koichi; Kusakabe, Katsuki; Morooka, Shigeharu. *Ind Eng Chem Res* v 27 n 4 Apr 1988 p 571-576.

**087298 KINETICS OF REACTIONS IN THE SYSTEM  $FeS_2-O_2-H_2O$  AT ELEVATED TEMPERATURES AND PRESSURES.** The aims of the investigation included the following: 1) elucidation of the chemical nature of the process and distribution of the oxidation products between the liquid phase (solution) and the solid residue; 2) determination of the thermodynamic and kinetic relationships of oxidation; 3) clarification of the possibility of oxidation of pyrite sulfur to sulfuric acid; 4) study of the possibility of using the  $H_2SO_4$  formed by oxidation for simultaneous leaching of nonferrous metals from the corresponding ores present together with pyrite in the autoclave. It was found that, depending on the temperature and other operating parameters, oxidation of  $FeS_2$  in an aqueous suspension at temperatures in the range 100-230° results in formation of  $FeSO_4$ ,  $Fe_2(SO_4)_3$  and  $H_2SO_4$  in solution and  $Fe_2O_3$ ,  $Fe_2O_3 \cdot (1-3)H_2O$ ,  $2Fe_3(SO_4)_2(OH)_5 \cdot 2H_2O$  and  $S^0$  in the solid residue. 5 refs.

## Structure

**087300 APPLICATION OF ANISOTROPIC ELECTRON DIFFRACTION TO DETERMINE THE DISPLACEMENT VECTOR OF STACKING FAULT IN PYRITE.** The stacking faults (SF) commonly observed in pyrite of various occurrences have fault planes parallel to the {100} planes. However, the displacement vector (R) of the SF is controversial in the literature. In the present study the components of R are confirmed directly using lattice imaging and g-R contrast analysis by taking advantage of the anisotropic electron diffraction spots (g) which enable the imaging of the {100} lattice planes. The contrast analysis and the lattice images by the anisotropic electron diffraction spots confirm that the displacement vector is consistent with the theoretical value of  $R = \langle 0.27, \frac{1}{2}, 0 \rangle$ . The component of  $\frac{1}{2}$  normal to the stacking fault plane [100] and the component of 0.27 lying within the stacking fault indicate that the stacking fault is not formed by simple shearing along the fault plane. 10 refs.

**087301 ELECTRONIC STRUCTURE OF PYRITES, PARTICULARLY  $\text{CuS}_2$  AND  $\text{Fe}_{1-x}\text{Cu}_x\text{S}_2$ : AN XPS AND MOESSBAUER STUDY.** The MND skewness of X-ray photoelectron spectroscopy (XPS) core levels is used to study the character of the wave functions at the Fermi level of a number of pyrites  $\text{MS}_2$  (M = Fe, Co, Ni, Cu). It is shown that the degree of mixing between the metal 3d  $e_g$  levels with the  $\pi^*$  levels of the  $\text{S}_2$  anion is essential in understanding the properties of these materials; while  $\text{FeS}_2$  can be described as  $\text{Fe}^{2+}(\text{S}_2)^{2-}$  with  $\text{Fe}^{2+}$  in the low-spin configuration,  $\text{CuS}_2$  is essentially  $\text{Cu}^+(\text{S}_2)^{-}$ . In the pyrite-type solid solutions  $\text{Fe}_{1-x}\text{Cu}_x\text{S}_2$  Cu again has a  $d^{10}$  configuration, while Fe retains the spin-paired  $d^6$  configuration, as shown by XPS and Moessbauer spectroscopy. (Author abstract) 14 refs.

## Research

**087302 PYROELECTRICITY OF AROMATIC COMPOUNDS.** Recent studies of pyroelectricity in crystallized aromatic compounds - benzene derivatives - are discussed and summarized. The dielectric and pyroelectric behavior of some di- and trisubstituted benzenes as a function of temperature is presented. Experimental results are compared with evaluations based on the INDO-approximation including a self-consistent electrostatic crystal field approach. (Author abstract) 20 refs.

**087304 NON-FERROUS PYROMETALLURGY - A CHANGING INDUSTRY.** The non-ferrous pyrometallurgical industry has been under extreme pressure since 1980 and significant changes are taking place, principally in the copper, nickel and lead industries. This paper reviews some of these changes, particularly with respect to smelter capacity, major technical trends, and the industry's response to increased energy costs and environmental constraints. The Canadian metal mineral production for 1985 has been estimated at a value of over \$8 billion, of which half is derived from copper, nickel, lead and zinc production. It is in our national interest that the Canadian industry remain competitive in the world market and continue its traditional contribution to the Canadian economy. (Author abstract) 14 refs.

## Computer Simulation

**087305 PROCESS PRECONCEPTION BY STEPWISE EQUILIBRIUM ANALYSIS (SEA), PART 2, COMPUTER METHOD: THE REDUCTION OF  $\text{AlCl}_3(\text{g})$  WITH MOLTEN MANGANESE.** The fundamental principles of computer SEA method have been described by demonstrating it in the simulation of a batch process reactor for the production of Al-Mn alloys from  $\text{AlCl}_3(\text{g})$  and Mn(l). The subject matter includes the use and caution of the Newton-Raphson (NR) loop, non-convergence in relation to trigger (initial approximate) roots, relevance of assessing minor species outside the NR loop, and so forth. It has been shown numerically that the SEA technique can also be used to simulate the performance of continuous process reactors operating under steady-state conditions. (Author abstract) 10 refs.

**PYROMETERS** See Also FLAME RESEARCH—Temperature Measurement; STEEL—Continuous Casting.

**087307 METHOD OF DETERMINING THE TEMPERATURE OF A SPECTRAL RATIO BY A WIDE-BAND OPTICAL PYROMETER.** Pyrometric methods are used extensively to determine the temperature of heated bodies by a contactless method. The color temperature, defined as the temperature of an ideal black body (IBB) for which the ratio of the spectral densities of the IBB emission for the wavelengths  $\lambda_1$  and  $\lambda_2$  equals the corresponding ratio of the spectral densities of the object emission is often used as an estimate of the object temperature. Color pyrometers (spectral ratio pyrometers) are used to measure the color temperature. In this paper it is proposed to introduce the concept of an integrated color temperature (ICT). The ICT is defined in a unique manner for known spectrum band limits and by a known ratio of the object emission densities in two bands and does not require involvement of the concept of effective wavelength. It is also shown that the selectivity of the radiation detector does not hinder (with the exception of degenerate cases) the construction of a temperature scale based on measurement of the signal ratio from the pyrometer sensors receiving the emission energy of the heated object in two bands. 5 refs.

**087308 PYROMETRE A FIBRE OPTIQUE POUR LA MESURE DES BASSES TEMPERATURES.** [Optical Fiber Pyrometer for Low Temperature Measurements]. Optical fibres made of fluoride glass allow surface temperature measurement of various objects uneasy to reach, mobile or located in adverse environments. Such an infrared fibre, with transmittance extending beyond 5  $\mu\text{m}$ , allows transmission of IR radiation to an IR sensor which transforms it into a usable signal. The set-up realised can take measurements down to 50°C, and 30°C in a next future. The sensor signal is pre-amplified and then processed by a lock-in amplifier. An IR reference internal source is used to deliver a known constant level to the sensor and allows absolute temperature measurements. The present measurement accuracy obtained with a blackbody at 200°C is  $\pm 0.5^\circ\text{C}$ . We are about to use such a device for monitoring irradiated fuel rods temperature in the Superphenix 1 breeder power plant. (Author abstract) 10 refs. In French.

**087310 MESURE DES TEMPERATURES JUSQU'A 2800°C PAR PYROMETRIE A DILATATION.** [Temperature Measurement Up to 2800°C by Thermal Expansion Pyrometry]. A thermal expansion pyrometer may be an attractive solution for the measurement and regulation of high temperatures. It should rely on materials heat resistant enough to avoid any long term modification at the highest temperature of utilization and with coefficients on thermal expansion high enough to provide a good sensitivity. A stack of hot pressed pyrographite disks with a sheath of glassy carbon suits these conditions up to 2800°C under an inert or reducing atmosphere. There is no hysteresis between heating and cooling and the reproducibility of the measurement at 2800°C is better than 20°C. (Author abstract) In French. 3 refs.

**087316 PROBLEM-SOLVING METHOD AIDS QUALITY IMPROVEMENT.** The use of statistics for quality improvement achieves the greatest results when it operates within the framework of the problem-solving method. The problem-solving method (also called the scientific method) as applied to quality improvement has six steps. They are: problem identification, project team assignment, problem analysis, possible solutions, evaluation, and remedial action. They are not independent steps; they are interdependent and interrelated. Quality improvement is the goal and the problem-solving process a framework to achieve that goal. 5 refs.

**087320 YOU CAN HAVE YOUR PROFITS AND QUALITY, TOO.** Some suggestions are presented on how to start planning a quality assurance program for a company. Quality is defined as adhering to the specification of a given job. Involvement of all personnel in the program is emphasized. The preeminent role of the management is pointed out.

Anon. *Fastener Age* v 2 n 1 Jan-Feb 1988 p 20-21.

**087321 LAYERED MODEL FOR LIFE CYCLE ENGINEERING.** This paper seeks to present an alternative model of the engineering life cycle that is applicable to a number of engineering disciplines. At the same time the model seeks to address the fundamental failure of other models by trying to provide a framework within which to develop a project, grounded on the firm foundation of a quality assurance system conforming to an agreed national standard. Rules covering the bonding and traversal mechanism are described. (Author abstract)

Bibby, J.W. (Directorate General of Defence Quality Assurance, Bromley, Engl); Jones, I.E. *Qual Assur* v 14 n 2 Jun 1988 p 54-58.

**087322 STATISTICAL APPROACH TO QUALITY IN AUTOMATED MANUFACTURING.** The roles of some of the 'traditional' and recent concepts of quality engineering in an automated manufacturing environment are discussed. An overview of quality assurance activities is first given. This is followed by an explanation of the evolution of the applications of statistical quality control, and finally an examination is made of the need for such applications vis-a-vis automated manufacturing. 29 refs.

Goh, T.N. (Natl Univ of Singapore, Singapore). *Qual Assur* v 14 n 2 Jun 1988 p 59-63.

**087323 OVERALL QUALITY IMPROVEMENT—TOTAL QUALITY IMPROVEMENT (QI/TQI) PROGRAMME: FROM 1 PER CENT AQL TO 10 ppm.** This paper describes the quality improvements made in the four years from July 1982 to July 1986 in a company which is a major manufacturer of electronic components. Products include foil capacitors, delay lines, quick heat cathodes and metal precision parts for use in picture tubes, and also wire and lamp spirals, mainly for use in lighting. The paper tells how a coherent quality policy was developed and linked with company-wide initiatives and with plant and product group quality objectives. It gives a detailed account of the implementation program, and examples which illustrate the direct results of the various improvement activities. The paper also explains how quality awareness and sensitivity to customer needs have been strengthened, and how the company is managing to 'hold the gains' through audits and controls. (Edited author abstract) 1 ref.

Payne, B.J. (Mullard Blackburn, Engl). *Qual Assur* v 14 n 2 Jun 1988 p 69-77.

**087324 BEYOND QUALITY: TAKING SPC UPSTREAM.** Statistical process control (SPC) is an important tool for improving quality and productivity. Many companies are moving from manufacturing process quality control to product development quality control. One of the emerging technologies at the forefront of this movement is Quality Function Deployment (QFD). QFD helps companies design more competitive products, in less time, at lower cost and higher quality. QFD is aimed at detecting and solving quality problems at a much earlier

stage than is SPC. This article explores QFD concepts, and examines the longer-term limitations of reliance on SPC to achieve leadership in cost and quality. 2 refs.

Fortuna, Ronald M. (Ernst & Whinney, USA). *Qual Prog* v 21 n 6 Jun 1988 p 23-28.

**087325 NEW PARADIGM FOR QUALITY ASSURANCE.** A concept selection technique that uses the Quality Function Deployment (QFD) planning chart ensures customer needs are appropriately represented in the design. The focus is on satisfying customer needs. This approach favorably affects product quality and engineering efficiency before a design becomes reality - when there is maximum leverage to satisfy the customer. The concept selection technique uses QFD and allows the development team to become intimately familiar with product requirements prior to concept selection. This critical sequence improves the initial direction of the product development program. Many benefits that boost efficiency and product quality result from this improvement.

Kenny, Andrew A. (Eaton Corp, Carol Stream, IL, USA). *Qual Prog* v 21 n 6 Jun 1988 p 30-32.

**087326 QUALITY VS. SAFETY.** This article contrasts the broad concepts of quality with the specific responsibilities of safety. Quality assurance reduces failures; product safety reduces risks of hazards.

## Computer Aided Manufacturing

**087327 USE OF COMPUTERS IN QUALITY ASSURANCE SYSTEMS FOR LARGE MANUFACTURING AND CONSTRUCTION PROJECTS.** This conference proceedings contains 9 papers on the use of computers in quality assurance systems. Some of the topics covered are quality assurance: of data in database systems and information retrieval systems; of computer software; in the manufacture and testing of electronic components; in military command systems and in CAD/CAM. Quality assurance techniques, as well as management information systems relating to quality assurance are discussed. Technical and professional papers from this conference are indexed and abstracted with the conference code no. 08696 in the Ei Engineering Meetings (TM) database produced by Engineering Information, Inc.

Anon (IEE, Computing & Control Div, London, Engl). *IEE Colloq Dig* n 1986/39, Use of Comput in Qual Assur Syst for Large Manuf and Constr Proj, London, Engl, Mar 19 1986. Publ by IEE, London, Engl, 1986 var pagings.

## Computer Applications

**087328 ERFABRUNGEN MIT CAQ. [Experiences with CAQ].** Integrated quality assurance denotes involvement of all the relevant fields and thus all the phases of the product cycle. This again means integration of the computer aided quality assurance (CAQ) in all the appropriate data processing application systems. Such a solution is nowadays a multilayered problem and touches on almost all the areas of a production enterprise. A modern CAQ solution is therefore a complex subject which must be structured and implemented only step by step. (Translated author abstract) In German.

Winterhalder, L. *F&M Feinwerktech Messtech* v 95 n 6 Sep-Oct 1987 p CA126-CA128.

**087329 ASSURING QUALITY AND RELIABILITY OF COMPLEX ELECTRONIC SYSTEMS: HARDWARE AND SOFTWARE.** Some of the most recent trends in expanding the scope of traditional quality-assurance techniques to include all phases of design, develop-

ment, manufacture, and deployment, considering both hardware and software, are discussed. Emerging views on quality management are discussed. The life cycle of a product, beginning with the setting of requirements, and including assuring parts reliability, evaluating a fault-tolerant architecture, avoiding physical design hazards, enforcing software development methodology, measuring conformance to requirements in manufacture, and tracking performance in the field is considered. The author's goal is to review, in a general way, what can be accomplished through use of the various assurance techniques with references given to examples from the literature, which gives historical background as well as teaches the technical methods in detail. 66 refs.

**Costs** See CONSTRUCTION INDUSTRY—Performance.

**Europe** See WELDING—Quality Assurance.

## Evaluation

**087330 OBJECTIVE QUALITY EVALUATION FOR LOW-BIT-RATE SPEECH CODING SYSTEMS.** An LPC (linear predictive coding) cepstrum distance measure (CD) is introduced as an objective measure for estimating the subjective quality of speech signals. Good correspondence between LPC CD and the subjective quality, expressed in terms of both opinion equivalent Q and mean opinion score, are shown. Good repeatability of objective quality evaluation using LPC CD is also shown. A method for generating an artificial voice signal that reflects the characteristics of real speech signals is described. The LPC CD values calculated using this artificial voice are almost the same as those calculated using real speech signals. The speaker-dependency of the coded-speech quality is shown to be an important factor in low-bit-rate speech coding. Even taking this factor into consideration, LPC CD is shown to be effective for estimating the subjective quality. 8 refs.

**Management** See Also PUMPS—Reliability; QUALITY CONTROL—Management; WIRE DRAWING—Quality Assurance.

**087332 FRAMEWORK FOR A SERVICE QUALITY ASSURANCE SYSTEM.** Some basic themes about quality control and quality assurance are given. The manufacturing quality control model starts with quality of design - the user-based approach, and identifies the product characteristics desired by the user. Standards are then established for those characteristics (product- and value-based approach), and the product is designed to meet those standards. In production, conformance to standards is measured (manufacturing-based approach) by testing and/or inspecting the output, and by monitoring the input materials and the production process. Nonstandard output is analyzed to determine the cause of failure, so that corrective action can be taken. 7 refs.

King, Carol A. *Qual Prog* v 20 n 9 Sep 1987 p 27-32.

**087333 QUALITY ASSURANCE CAN BE MANAGED EFFECTIVELY AS A DISTRIBUTED FUNCTION.** Recently a project was conducted, the purpose of which was to provide a quality assurance function where none previously existed and at the same time to verify the validity of a non-traditional solution to the quality control problem. This was done by first designing, then modeling and implementing a quality assurance function based on distributed rather than centralized responsibility. As discussed in the articles, at least in this case, the distributed system works and the theory was validated. The approach to the solution was; existing employee attitudes were measured to determine if attitudes toward quality needed to be improved; a paper model was constructed using the results of the employee survey and the needs of the company as a basis for the design; the system was implemented and the results measured against two criteria. 4 refs.

**087335 QUALITY ASSURANCE AND BS 5750.** Quality assurance systems can save millions annually by reducing quality defects, cutting production costs and enhancing the image and marketing power of a mill. Most firms with QA systems achieve payback within 3 to 15 months, and some are reporting a 20% increase in turnover. The paper describes BS 5750 - the UK's national standard for quality assurance - what it involves, and how it can help a company. (Author abstract)

Guest, David A. (Pira, Leatherhead, Engl); Allibone, Trudie. *Pap Technol Ind* v 28 n 5 Aug 1987 p 544-546.

**087336 BENEFITS OF AN IN-HOUSE QUALITY ASSURANCE PROGRAMME TO AN INTERNATIONAL INSPECTION COMPANY.** This paper describes how a company, which provides third party inspection and quality auditing services to construction, mechanical engineering and petrochemical industries, developed its own quality assurance program. This was designed to improve, in particular, written procedures, internal auditing and recruitment and training. BS5750: Part 2 was selected as the quality standard most appropriate to an international service company, and the authors give a detailed breakdown of how the standard was interpreted to ensure that the program would comply fully with its requirements. While the costs of the program are difficult to quantify, its benefits are considerable. (Author abstract)

**087340 SIMPLE METHOD FOR STUDYING RUN-LENGTH DISTRIBUTIONS OF EXPONENTIALLY WEIGHTED MOVING AVERAGE CHARTS.** A numerical procedure using integral equations is presented for the tabulation of moments of run lengths of exponentially weighted moving average (EWMA) charts. Both average run lengths (ARL's) and standard deviations of run lengths (SDRL's) are presented

for the two-sided EWMA chart assuming normal observations, along with an example illustrating how to design such a chart. The procedure given extends easily to many nonnormal cases and to one-sided versions of the EWMA chart. (Author abstract) 11 refs.

**087341 NOTE ON MULTIVARIATE CUSUM PROCEDURES.** Cumulative sum (CUSUM) procedures are among the most powerful tools for detecting a shift from a good quality distribution to a bad quality distribution. This article discusses the natural application of CUSUM procedures to the multivariate normal distribution. It discusses two cases, detecting a shift in the mean vector and detecting a shift in the covariance matrix. As an example, the procedure is applied to measurements taken on optical fibers. (Author abstract) 19 refs.

Healy, John D. (Bell Communications Research, Red Bank, NJ, USA). *Technometrics* v 29 n 4 Nov 1987 p 409-412.

**087342 QUALITY GURUS - PART 1: THE DEMING PHILOSOPHY.** There is a belief that higher quality costs more. In fact, higher quality costs less, according to some. Dr. W. Edwards Deming's Fourteen Points provide a philosophy of management to implement quality control. 5 refs.

Propst, Annabeth L. (Process Management Inst, Bloomington, MN, USA). *Mach Tool Blue Book* v 82 n 12 Dec 1987 p 38-42.

**087343 VENDOR RELATIONS: AN IMPORTANT PIECE OF THE QUALITY PUZZLE.** More sensible arrangements with vendors can boost quality because often vendors do not deliver component parts with sufficiently high quality. Some topics discussed by this paper are these: vendor relations and quality, quality guaranteed or improved by inspection, Deming's plan, price alone not being a criterion for purchase, the importance of the purchase agent, multiple sourcing, single sourcing, and writing contracts. 9 refs.

Gitlow, Howard S. (Univ of Miami, Coral Gables, FL, USA); Wiesner, Donald A. *Qual Prog* v 21 n 1 Jan 1988 p 19-23.

**087344 TAGUCHI APPROACH TO PARAMETER DESIGN.** In the words of G. Taguchi: The quality of a product is the (minimum) loss imparted by the product to the society from the time the product is shipped. 3 refs.

Byrne, Diane M. (Eaton Corp, Southfield, MI, USA); Taguchi, Shin. *Qual Prog* v 20 n 12 Dec 1987 p 19-26.

**087345 DON'T BE FOOLED BY THE MEASUREMENT SYSTEM.** The major purpose of an SPC/SQC program is to make sure that the process is controlled so that a quality product is consistently made - that is, to ensure that off-spec material is not produced. Control limits are usually determined from the data obtained from normal quality control tests. Thus, attention must be given to the test and measurement systems used to monitor quality-related parameters. One must be confident that when a change is made to the process it is in response to a process problem and not a variation or change associated with a test or measurement. In the experiences of the authors at a number of manufacturing locations, the measurement systems have been a major problem. Thus, it is advantageous to focus initially on the measurement systems - to establish their adequacy and remove assignable causes from them - before investigating process capability. This strategy played a role in a quality improvement effort that saved over \$3 million; the cases described are taken from that effort. 8 refs.

Bishop, Lane (Allied Signal Inc, Buffalo, NY, USA); Hill, William J.; Lindsay, Wayne S. *Qual Prog* v 20 n 12 Dec 1987 p 35-38.

**087346 IMPROVING PRODUCT RELIABILITY.** In the last three decades, reliability has become an

important measure of product performance. The emphasis started in military and space programs and has spread to most consumer goods. Reliability is 'the probability that a product will perform its intended functions under stated conditions for the specified time.' From this definition it can be seen that reliability is a probabilistic concept, involving a product's planned use, its operating environment, and time. The techniques discussed use those three elements to improve the reliability of products. 5 refs.

Burgess, J.A. (Westinghouse Power Transformer Plant, Muncie, IN, USA). *Qual Prog* v 20 n 12 Dec 1987 p 47-54.

**087347 PERFORMANCE INDICATORS - WHY, WHERE AND HOW?** The drive for 'total quality control' has strongly enhanced the interest for performance indicators in many companies. This paper briefly describes how useful performance indicators are designed, what can be done with them, how they should be employed and what pitfalls have to be avoided during implementation. It is shown that if properly used, they provide management at all levels with a tool to monitor and control their business. They indicate the quality of products and services, of activities and actions to improve affairs, and in this way are a welcome quantitative and non-financial complement to the traditional financial reports. 1 ref.

Fortuin, Leonard (Nederlandse Philips Bedrijven BV, Eindhoven, Neth). *Eur J Oper Res* v 34 n 1 Feb 1988 p 1-9.

**087348 TESTING FOR INTERACTIONS USING THE ANALYSIS OF MEANS.** An analysis of means (ANOM) procedure is suggested for testing the significance of two-factor interactions in fixed-effects balanced designs. When at least one factor is at only two levels, the suggested procedure uses the exact critical points for the ANOM. New critical points are given for the case in which both factors are at more than two but fewer than six levels. The procedure can be extended to higher-order interactions, but the quantities being plotted become so complex that they are of little use in assessing practical significance. (Author abstract) 10 refs.

**087349 SPECTRAL ANALYSIS IN QUALITY CONTROL: A CONTROL CHART BASED ON THE PERIODOGRAM.** This article is concerned with the development of a control chart that detects cycles in the process mean. The new control chart, the spectral control chart, is based on the periodogram. The value plotted at each point in time is the ratio of the largest periodogram ordinate to the average of all ordinates. When an observation falls above the prescribed control limit, an out-of-control signal is given. The spectral control chart is compared with the Shewhart and geometric moving average charts. (Edited author abstract) 23 refs.

Beneke, Margarita (Univ of Oklahoma, Norman, OK, USA); Leemis, Lawrence M.; Schlegel, Robert E.; Foote, Bobbie L. *Technometrics* v 30 n 1 Feb 1988 p 63-70.

**087350 METAMORPHOSIS OF THE QUALITY FUNCTION.** After World War II when Europe and Japan were busy rebuilding, North American industry has a monopoly on the market. In this economic climate, two different approaches to the quality function evolved: One, rooted in the economy's public sector, promoted quality assurance departments, while the other, rooted in the private sector, fostered quality control departments. The former subsists in a contractual environment; whereas the latter subsists in a marketing environment. Despite the distinct differences in their roots and initial missions, the quality assurance and the quality control function have common features. While a new appreciation of quality

control is emerging in the U.S., industrial leaders still do not think of quality improvement as a crucial way of improving cost effectiveness. 17 refs.

Stanenas, Al P. (Honeywell Ltd, Canada). *Qual Prog* v 20 n 11 Nov 1987 p 30-33.

**087351 VALUES-ORIENTED APPROACH TO QUALITY.** Since the late 1970s American industry has been in a headlong rush to replace quality systems that could only detect problems and defects with those that can prevent them. (Edited author abstract)

Gilbert, Ross J. (Kohler Co). *Qual Prog* v 20 n 11 Nov 1987 p 38-40.

**087352 NEW ZEALAND'S QUALITY CHALLENGE.** Political, economic, and social changes are having a profound effect on New Zealand's agriculture, manufacturing, and service sectors, presenting new challenges for the quality professional. Over the past decade much has been done to raise the level of awareness and understanding of the role of quality assurance in industry. Some topics discussed in this paper are these: documented quality systems, usually employed in large companies, and their general absence in small companies; consumer awareness of quality; new roles for quality professionals; quality improvement and industrial relations; research and development; and the avoidance of disillusionment with quality improvement efforts.

Wenmoth, Bryan A. (Massey Univ, Palmerston North, NZ). *Qual Prog* v 20 n 11 Nov 1987 p 45-47.

**087353 TOMORROW'S TOTAL QUALITY MANAGER.** In the tighter work scheduling of today's manufacturing, reworking a product has become prohibitively expensive. As a result, total quality at Westinghouse is defined as 'performance leadership in meeting customer requirements by doing the right things right the first time'. A discussion is given on how Westinghouse goes about enhancing the quality of its products and redefining the role of the quality manager. 1 ref.

Aquino, Michael A. (Westinghouse, Pittsburgh, PA, USA). *Qual Prog* v 20 n 11 Nov 1987 p 48-50.

**087354 QUALITY SERVICES: A NEW BUSINESS PARTNER.** For a company to adopt the new quality and business principles and achieve continual improvement in a time frame that will not let competitors erode the existing competitive advantages, an infrastructure must exist to provide quality technology, business and process improvement methodologies, and leadership and enthusiasm. The infrastructure must have a clear constancy of purpose to support line management in achieving this new-age thinking and competitive advantage. Eastman Chemicals Division (ECD) recognizes that quality is a strategic business issue. ECD's quality policy outlines its quality goal, the principles to follow, the operation policy for guidance, and the elements that support achievement of the goal. ECD developed a 'quality services' organization to help integrate and coordinate the activities that will lead to the policy's implementation. This new business partner is a function incorporated into ECD's infrastructure.

White, James R. (Tennessee Eastman Co); Dingus, Victor R. *Qual Prog* v 20 n 11 Nov 1987 p 56-60.

**087355 INTRODUCTION TO TAGUCHI METHODS.** The methods of quality improvement developed by Genichi Taguchi have already found widespread acceptance in Japan and the US. Based on a different way of thinking about quality, they use statistical analysis to ensure high product quality. Taguchi's thinking on quality is based on two fundamental concepts: that any loss in quality is defined as a deviation from a target, not a failure to conform to an arbitrary specification; and that high quality can only be achieved economically by being designed in from the start, not by inspection and screening. Taguchi's definition of quality is customer-oriented. Quality is the characteristic that avoids loss to society after the product is shipped. A loss of quality can therefore be measured in pounds, dollars or yen. His philosophy is

that adding features is not a way of improving the quality of a given product, only of varying its price and the market segment it is aimed at.

Taguchi, Genichi. *Engineering (London)* v 228 n 1 Jan 1988 p 1-11.

**087356 STATISTICAL QUALITY CONTROL IMPLEMENTATION.** Statistical Process Control, or SPC, is simply 'the application of statistical techniques, such as control charts, to control and improve a process to achieve uniformity in its output'. A process is any combination of manpower, machines, methods, materials and a measurement system (laboratory) which together produce an output, each of which contributing to the inherent variation observed in the outputs. The history of SPC is briefly recalled and the role of random variation in SPC is examined. The SPC tools, such as histograms, trend charts, control charts, flow charts, cause and effect diagrams, Pareto Charts, scatter diagrams, and experimental designs are explained and illustrated.

Ricks, W.H. (Union Carbide). *Fastener Age* v 2 n 1 Jan-Feb 1988 p 34-40.

**087357 'BREAKTHROUGH' APPROACH TO QUALITY IMPROVEMENT.** Traditional concepts of 'controlling quality levels' are no longer sufficient. The Juran approach urges companies to break the chain of the past, reaching improved quality levels on an ongoing basis. An organized step-by-step approach to creating breakthrough results is the hallmark of the Juran quality improvement process. The Juran Institute studies suggest that a reasonable objective for a company is to cut the costs of poor quality in half over a period of five years. This means cutting in two the product field failure rates, internal waste, and all other related costs associated with poor quality. The radical departure proposed by the Juran program is that each member of management personally engage in quality improvement. Typically, a quality steering committee (or council) comprising key operating members of the top management team is created. The steering committee determines the broad policy for the quality improvement programs, determines how training will be implemented throughout company management, and forms project teams to begin the process of improvement.

Anon. *Chem Eng Prog* v 84 n 4 Apr 1988 p 25-26.

**087358 QUALITY MANAGEMENT SYSTEMS IN HIGH-PERFORMANCE PLASTIC FILMS.** A three-fold model is proposed for a Quality Management System which is composed of the quality cycle, generic concepts for suppliers and customers, and continuous improvement. These items form a base for understanding the basic principles and the movement of information and action within a system. The three elements are: the quality circle; generic concepts for supplier-customer relations; and, continuous improvement. Methods for organizing quality teams and elements of the quality management system are given. The author also covers such topics as: Statistical analysis; segregated product and release plus supplier relations. 5 refs.

Hovermale, Ralph A. (Du Pont, Circleville, OH, USA). *Chem Eng Prog* v 84 n 4 Apr 1988 p 36-44.

**087359 EXCELLENCE THROUGH QUALITY IMPROVEMENT.** The author discusses factors leading to an improvement in product quality. A brief discussion is presented of the Juran program of Quality Improvement. An outline is given of the strategies required to achieve the goal of being recognized as the quality leader. The organization of a Quality team is highlighted and the emphasis on training is reviewed. A vendor improvement plan is also described.

Carroll, Connie E. (Union Carbide Corp, Seadrift, TX, USA). *Chem Eng Prog* v 84 n 4 Apr 1988 p 45-51.

**087360 ON-LINE STATISTICAL QUALITY CONTROL.** The authors show that the principal components of a process monitoring system and their functions must be clearly understood to properly apply SQC. Numeric

and nonnumeric data must be acquired from the sensors and lower-level devices, such as programmable and analog controllers that actually control the process. A database designed for process experimentation, display flexibility, and SQC must have the following features: storage of a value; file depths; logging of variables; log entry tagging; long term data storage; and, compressed data. Techniques for obtaining data for SQC charts are outlined. The need for maintaining two databases is explained along with the use of trend and scatter diagrams. The use of Pareto charts is also discussed.

Gimson, Guy D. (Allen-Bradley Co Inc, Highland Heights, OH, USA); Coleman, Gary G. *Chem Eng Prog* v 84 n 4 Apr 1988 p 58-64.

**087361 LABOR/MANAGEMENT PARTICIPATION: THE A.O. SMITH EXPERIENCE.** The immediate imperative behind the changes taking place at the company is survival in the tough automotive components business, but the long-term thrust is very definitely competitiveness through world-class quality with all its implications. The company and its unions have agreed that the way to get there is through a quality-focused notion of workplace democracy. Together, labor and management have embarked upon an ambitious program of joint planning and problem solving called B.E.S.T. (Bringing Employee Skills Together). The B.E.S.T. system represents a completely new approach to doing business at A.O. Smith. It is a form of labor/management participation that is creating an environment conducive to change. B.E.S.T. promotes quality by making full use of the skills, knowledge, and potential of the entire work force. These and other aspects of the subject are discussed.

Ryan, John. *Qual Prog* v 21 n 4 Apr 1988 p 36-40.

**087362 SETTING QUALITY GOALS.** Few subjects in the arena of quality and productivity evoke such extreme reactions as goal setting. Advice on this subject varies widely and is rarely specific or proven. Experience of both people who set goals and people who must meet them are almost universally frustrating, to say the least. And yet most people seem to have a basic need to set specific goals and to achieve them. Unfortunately, most goals lack that specificity; they fail to define both a rational objective and a time line for its achievement. What is needed is an empirically based goal-setting model for legitimate quality improvement process (QIP) activities. (Edited author abstract) 14 refs.

Schneiderman, Arthur M. *Qual Prog* v 21 n 4 Apr 1988 p 51-57.

**087363 QUALITY CONTROL BY SPECTRAL ANALYSIS.** The construction of an inspection procedure for devices which are working under mechanical stress is discussed. The underlying model assumes that vibration under a certain form of stress is nearly constant with a continuous spectrum. The observation of vibration at specified times leads to estimates of the spectral density functions. Two characteristic deviations between the estimated and the expected form of the spectral density function are discussed which are the basis of quality control charts. On the one hand, some measure for a global difference between these functions (e.g. integrated squared differences) and on the other hand, some measure for the greatest difference have to be used. For special measures concrete statistical inference is possible. (Author abstract) 7 refs.

Strelec, H. (Univ of Technology of Vienna, Vienna, Austria). *Int J Mater Prod Technol* v 3 n 1 1988 p 11-19.

**087364 EXPLANATION AND CRITIQUE OF TAGUCHI'S CONTRIBUTIONS TO QUALITY ENGINEERING.** This paper explains some of Taguchi's contributions to quality engineering and also provides a critical evaluation of his statistical methods. Our conclusion is that although on the one hand, Professor Taguchi's quality engineering ideas are of great importance and should become part of the working knowledge of every

engineer, on the other hand, many of the techniques of statistical design and analysis he employs to put these ideas into practice are often inefficient and unnecessarily complicated and should be replaced or appropriately modified. In this short article only an overview is attempted, but references are appended where these matters are discussed in greater detail. (Edited author abstract) 37 refs.

Box, George (Univ of Wisconsin-Madison, Madison, WI, USA); Bisgaard, Soren; Fung, Conrad. *Qual Reliab Eng Int* v 4 n 2 Apr-Jun 1988 p 123-131.

**087365 SIGNAL-TO-NOISE RATIO DEVELOPMENT FOR QUALITY ENGINEERING.** Dr. Taguchi developed the concept of signal-to-noise (SN) ratio in quality engineering to evaluate the performance of a system. The objective is to develop systems which are robust against noise factors. The SN ratio indicates the degree of the predictable performance of a product or process in the presence of noise factors. Parameter design of the Taguchi method optimizes the SN ratio in the domain of control factors, so that performance could be made insensitive to the noise factors in order to improve product quality. The SN ratio for four cases of dynamic characteristic problems is developed in this paper. This paper also gives the method to compute SN ratios for both equispaced and non-equispaced intervals for levels of signal factors. Two examples are presented to illustrate the method. (Edited author abstract) 12 refs.

Kapur, Kailash C. (Wayne State Univ, Detroit, MI, USA); Chen, Guangming. *Qual Reliab Eng Int* v 4 n 2 Apr-Jun 1988 p 133-141.

**087366  $\bar{X}$  CHARTS WITH VARIABLE SAMPLING INTERVALS.** This article considers the properties of the  $\bar{X}$  chart when the sampling interval between each pair of samples is not fixed but rather depends on what is observed in the first sample. The idea is that the time interval until the next sample should be short if a sample shows some indication of a change in the process and long if there is no indication of a change. The proposed variable sampling interval (VSI)  $\bar{X}$  chart uses a short sampling interval if  $\bar{X}$  is close to but not actually outside the control limits and a long sampling interval if  $\bar{X}$  is close to target. If  $\bar{X}$  is actually outside the control limits, then the chart signals in the same way as the standard fixed sampling interval (FSI)  $\bar{X}$  chart. (Edited author abstract) 16 refs.

**087367 APPLICATION OF CONDITION MONITORING TECHNIQUES TO PRODUCT QUALITY MONITORING.** Techniques normally associated with automated condition monitoring, such as dynamic analysis, spectrum comparison and fault diagnostics may be used to create a sensitive inspection technique for mechanical products capable of detecting faults not easily found from performance tests. This article outlines the concept of the technique, known as Product Quality Monitoring (PQM), examines some of the methods employed and discusses advantages, limitations and future development. (Author abstract)

Hughes, M.L. (BHRA, Cranfield, Engl). *Meas Control* v 21 n 4 May 1988 p 113-118.

**087368 AUTOMOTIVE CASE STUDY.** Eaton Corporation Controls Division realized that when the Quality Function Deployment (QFD) process was initially being viewed, a case study was needed as both a learning process and as an example to teach other interested groups. This article discusses how Eaton Corporation used an air conditioning part to clear the way for future QFD projects.

De Vera, Dennis (Eaton Corp, Carol Stream, IL, USA); Glennon, Tom; Kenny, Andrew A.; Khan, Mohammad A.H.; Mayer, Mike. *Qual Prog* v 21 n 6 Jun 1988 p 35-38.

**087369 ROLE OF TAGUCHI METHODS AND DESIGN OF EXPERIMENTS IN QFD.** Quality function deployment ties the product, user, value, and manufacturing viewpoints together in a continuous process of defining the product design and manufacturing requirements. The Taguchi loss function relates the user and manufacturing viewpoints to one another. Taguchi Methods, design of experiments, and QFD are complementary tools that should be used during the off-line phase of a product or process life cycle.

Ross, Philip J. (Saturn Corp, USA). *Qual Prog* v 21 n 6 Jun 1988 p 41-47.

**087370 QUALITY BY NUMBERS.** Statistical process control (SPC) is a collection of statistical techniques which, when applied to plant data, show variation of process or product variables. Displayed on charts, they allow plant management to assess the process's ability to perform consistently and measure subsequent performance changes. 'Statistics is very important because it allows you to recognise the significance of numbers,' says ICI's Dr. Arthur Thomas, a leading member of the company's SPC working party.

Atkinson, Nigel. *Process Eng (London)* v 69 n 4 Apr 1988 p 41, 43.

**087371 TESTS OF ELECTRONIC MEANS OF ACTIVE QUALITY CONTROL FOR DETERMINING THEIR TECHNICAL LEVEL.** The authors developed a method of comparative workshop tests for determining the technical levels of means of active quality control. In comparative workshop tests two measuring complexes take part simultaneously: one of them acts as measure of comparison, the other acts as the tested complex. Tests are made both with the entire measuring complex and with its principal component parts: the measuring head (MH) and the electronic transducer (ET). When only an MH or only an ET is tested, then the missing part of the tested complex of means of quality control is complemented by parts of the complex used as the reference complex. Three possible variants of complementing that are compared in comparative tests are given. The entire test period is divided into two equal cycles. The length of the tests (and the length of one cycle) depends on the required accuracy and reliability of their results, and by specifying these it is possible to determine the number of components to be processed during the time of the workshop tests. 2 refs.

**087372 RESCREENING-A USER'S HISTORY AND RECOMMENDATIONS.** Rescreening is performed as a methodology implemented by the original equipment manufacturer to gain confidence in both the inherent quality found in the component parts and the integrity of the prior testing performed on them. Our history at Martin Marietta Electronics Systems demonstrates that rescreening is a viable quality control process. No uniform sequence of test elements is used in rescreening. The various original equipment manufacturers and their customers have specified a broad range of plans to rescreen parts based on the system stress, the required level of systems reliability, the history of parts failures and the physics of failure. 1 Ref.

Zata, Saul (Martin Marietta Electronics Systems Cent, Orlando, FL, USA); Seller, Sandra. *Eval Eng* v 27 n 8 Aug 1988 6p.

**087373 ROBUSTNESS OF MEAN  $E(X)$  AND  $R$  CHARTS.** The effect of nonnormality on  $E(X)$  and  $R$  charts is reported. The effect of departure from normality can be examined by comparing the probabilities that  $E(X)$  and  $R$  lie outside their three-standard-deviation and two-standard-deviation control limits. Tukey's  $\lambda$ -family of symmetric distributions is used here because it contains a wide spectrum of distributions with a variety tail area. The constants required to construct  $E(X)$  and  $R$  charts for the  $\lambda$ -family are computed. Control charts based on the assumption of normality give inaccurate results when the

tails of the underlying distribution are thin or thick. The validity of the normality assumption is examined by using a numerical example. 13 refs.

**087374 ARRANGEMENT FOR AUTOMATING STATISTICAL QUALITY CONTROL OF PRODUCTS.** An important stage in assuring quality of mass-produced items is that of inspection testing to check the conformity of their actual quality factors  $R$  with the requirements of the standards, technical assignments, and technical conditions. With binomial tests the method used for this, as a rule, is single-step inspection based on the checking theory of the Neumann-Pearson hypothesis. Its special feature is that the size of the samples is planned beforehand, and a decision as to whether a product conforms or not with the imposed requirements is made only once, i.e., after tests on all the specimens in a sample. Inherent drawbacks are discussed, along with appropriate solutions. 3 refs.

**087375 CALCULATING THE COST EFFECTIVENESS OF TEST STRATEGIES.** Choosing a cost-effective test strategy for a product line is a complex issue. Considerations include such factors as the best stage to perform the testing, tester accuracy, tester cost, and the list goes on. This article provides guidelines that will simplify this complex task. In addition, it introduces a software tool that can make the task even easier. The article assumes a general model of manufacturing/test for an electronic product. It does a simple analysis of the effect of a stage of test/repair on the defect level passed on, and uses this simplified analysis to illustrate whether a test/repair stage is needed or not. The errors of this simplified approach are then pointed out. Each of these errors are handled by a spread sheet analysis of the problem, using a program that was developed for this purpose on Lotus 1-2-3, called TESAP (Test Strategy Assessment Program).

Hamilton, Steve (Hewlett Packard Co, Loveland, CO, USA). *Chilton's I&CS* v 60 n 11 Nov 1987 p 49-50, 55-57.

**087376 PC PROGRAM CALCULATES NORMAL PROBABILITIES.** Statistical quality control identifies the sources of manufacturing defects. To determine whether a given value is within specification, a normal probability distribution is integrated using a series expansion of the exponential function. This causes an overflow in most PCs because they limit the represented size of a number to less than  $10^{40}$ . Consequently, this limits the maximum size of  $n$  for which  $n!$  may be determined. To eliminate this difficulty, a more time-consuming series with better overflow controls is derived. The PC program which calculates the normal probabilities is presented in the article.

**087377 FRAMEWORK FOR EXPERT SYSTEM DEVELOPMENT IN STATISTICAL QUALITY CONTROL.** We have proposed a framework for developing expert systems for statistical process control applications. The knowledge base is partitioned into three sets: domain-independent analysis rules, which determine

whether or not the sample observations indicate a lack-of-control; interpretive rules, which analyze the patterns in the chart in terms of process changes; and domain-dependent diagnostic rules, which assist in determining assignable causes and corrective action. This structure allows some portability between applications and customizing to specific applications. (Author abstract) 5 refs.

Evans, James R. (Univ of Cincinnati, Cincinnati, OH, USA); Lindsay, William M. *Comput Ind Eng* v 14 n 3 1988 p 335-343.

**087378 QUALITY CONTROL INFORMATION SYSTEMS: AN ENTITY-RELATIONSHIP APPROACH.** In this paper, we present an entity-relationship framework for integrating aspects of data, models, and expertise for a computerized quality control information system (QCIS). A significant feature of the approach is to provide a logical view of the information flow and software requirements in the QCIS environment. (Author abstract). 20 Refs.

**Costs** See Also GLASS MANUFACTURE—Quality Assurance; INDUSTRIAL PLANTS—Costs; INSPECTION; PRODUCT DESIGN—Optimization.

**087379 QUALITY COST ANALYSIS: EXTEND THE BENEFITS.** The micro quality cost approach is valuable for determining and improving the effectiveness and efficiency of staff departments' activities; employees also become aware of the need to reduce waste in their department. This approach demonstrates that the quality system needs to be tailored to each staff department. Conducting the cost study, in fact, helps define an appropriate quality system. The micro quality cost approach extends the never-ending journey for quality improvement to the processes found in staff departments, supplementing the improvements tied to the end product. The traditional macro quality cost approach is still needed to document the entire company quality system and identify needed improvements that can be incorporated synergistically among departments. But the micro quality cost approach is an essential supplement. 1 ref.

Winchell, William O.; Bolton, Caroline J. *Qual Prog* v 20 n 9 Sep 1987 p 71-73.

**087380 QUALITY-RELATED COSTING: FINDINGS FROM AN INDUSTRY-BASED RESEARCH STUDY.** The paper summarizes the main limitations and omissions of the literature on quality control and provides guidance on the most authoritative reading of the subject. Experience acquired whilst carrying out the investigations at collaborating companies is reviewed and some of the major issues are discussed, including definitions of quality cost categories and elements, collection and reporting of quality cost data and the uses of quality costs. Alternatives are suggested to (or may be used to complement) the usual prevention-appraisal-failure approach to categorization of quality-related costs which is so firmly entrenched in both management thinking and the literature on the subject. (Edited author abstract) 29 refs.

## Design

**087381 SIMULATING THE DESIGN AND ANALYSIS OF QUALITY CONTROL SYSTEMS IN MANUFACTURING.** A manufacturing system simulator with modules for the simulation of the inputs and the basic transformation elements of the interrelated manufacturing and quality system is developed. Using this simulator and a design procedure, the manufacturing system is simulated to provide the 'best' solution in terms of the incoming quality and the cost of inputs, quality levels and cost of manufacturing and assembly processes, and the inspection plans for the inspection stations of the manufacturing system. The best simulated solution is the solution that provides the most economical cost of producing the

products of the interrelated manufacturing and quality system for desired outgoing quality of the products. (Edited author abstract). 18 Refs.

Palaniswami, S. (Central Michigan Univ, Mount Pleasant, MI, USA); Hassan, M.Z. *Eng Costs Prod Econ* v 14 n 3 Sep 1988 p 217-227.

**Economics** See INDUSTRIAL ECONOMICS—Efficiency.

**Education** See Also ENGINEERING EDUCATION.

**087382 EDUCATING FOR QUALITY: A DIFFERENT APPROACH.** The concept of the approach is to make text material about quality principles available to authors and publishers for use in core course books. For example, future marketing core texts would contain information relating to the marketing department's responsibilities toward product quality and customer satisfaction. Accounting and finance texts would introduce quality costs concepts. Material for each core course would focus on unique aspects of quality appropriate to that course. Since all students must complete core courses, the plan would increase broad-based understanding of quality and quality control by all graduates. Obviously, this is important because managers in functional areas other than quality control have a major impact on product and service quality. Business school graduates are prime candidates to move into these managerial positions. 1 Ref.

Johnson, Ross H. (James Mason Univ, USA); Winchell, William O. *Qual Prog* v 21 n 9 Sep 1988 p 48-50.

## Equipment

**087383 STANDARDIZED SERIES OF ULTRASONIC INSTALLATIONS FOR THE QUALITY CONTROL OF WELDED JOINTS AND ROLLED SHEET.** The designing installations for mechanized ultrasonic quality control, the designers took into account the requirements concerning the reliable detection of flaws while high productivity is maintained, ensuring the tuning-out of interfering signals, lucid and reliable recording of the results of inspection, the possibility of readjustment for the inspection of different products, and reliable operation of assembly units and blocks of the installation, the Installations Incorporate Systems for scanning and for recording the result of inspection, acoustic units with transducers and automatic control units. The newly designed installations were supplied to a number of enterprises and they are used for inspecting welded joints in housings of apparatuses, courses, flat welded sheet, rolled sheet, etc. Experience with the introduction of mechanized installations shows that the greatest effect is attained when these installations are integrated in the technological production line of articles. 5 refs.

## Inspection

**087384 OPTIMAL INSPECTION POLICIES IN A SERIAL PRODUCTION SYSTEM INCLUDING SCRAP REWORK AND REPAIR: AN MILP APPROACH.** The allocation of inspection effort problem for serial systems is formulated as a 0-1 mixed integer linear programming problem (MILP). This formulation permits any combination of scrap, rework, or repair at each station and allows the problem to be solved using standard MILP software packages. Moreover electronic spread-sheets may be used to easily calculate the relevant coefficients. An additional advantage of this approach when compared with the traditional dynamic programming approach is the ease with which the basic model may be modified. (Edited author abstract) 12 refs.

Bong Jin Yum (Korea Advanced Inst of Science & Technology, Seoul, South Korea); McDowell, Edward D. *Int J Prod Res* v 25 n 10 Oct 1987 p 1451-1464.

**087385 STATISTICAL TECHNIQUES APPLIED TO A MANUFACTURING PROCESS PROBLEM.** In any manufacturing industry, parts are manufactured

through various operations before they conform to their drawing specifications. Depending on the complexities of the part requirements, a single part such as an aircraft component may have to undergo more than 100 operations before it reaches its finished stage. If at the finished stage a dimension is found to be out of specification, quality and manufacturing engineers alike may encounter difficulties in tracking down the real culprits. This paper discusses the statistical techniques applied in tracing and identifying the causes of failure to comply with specifications. (Edited author abstract) 2 refs.

Goh, A.B. (Tandon Singapore Pte Ltd). *Qual Assur* v 13 n 3 Sep 1987 p 91-95.

**087386 EFFECTS OF INSPECTION ERROR ON A COMPLETE INSPECTION PLAN.** In a complete inspection plan, every incoming item is subject to variable inspection. If the inspection result indicates that an item fails to meet predetermined specification limits, the item is reworked so that its quality characteristic is exactly equal to the target value. The specification limits are determined by the tradeoff among the cost incurred by imperfect quality, cost of rework and cost of inspection. The economic and statistical effects of inspection error on the complete inspection plan are investigated. Two models with considerations of inspection error are developed under different rework schemes, then compared with the model without inspection error consideration. (Author abstract) 17 refs.

Tang, Kwei (Louisiana State Univ, Baton Rouge, LA, USA); Schneider, Helmut. *IIE Trans* v 19 n 4 Dec 1987 p 421-428.

**087387 SIMPLE INSPECTION SCHEME FOR TWO TYPES OF DEFECT.** For defect A, process control is at least as important as product screening. Low-cost, rapid sequential inspection takes place for a run of k consecutive type-A defectives. When this occurs, the production process is halted and, if necessary, adjusted, and the run of k defectives is discarded. The entire pre-run sequence is retained, forming the production run. No type-B defective are permitted, testing for this type of defect is expensive, so detection is by Dorfman screening of the production run. Features of interest are the choice of k in relation to the average length of a production run and the outgoing proportion defective, the average cost per production run of testing for attribute B, and the average number of items finally accepted for production run. (Edited author abstract) 13 refs.

## Instruments

**087388 MEASURING UP TO NEW DEMANDS.** Quality control is seen increasingly as a function which takes place at the machine, creating a need for portable and inexpensive measuring instruments and gauges. Besides being easy to use, they must be capable of capturing and analyzing the large amounts of data generated by statistical process control. The author introduces some of the new equipment available, including electronic calipers and hardness testers, in-process gauges, coordinate measuring machines, and noncontact optical inspection instruments.

Anon. *Mach Prod Eng* v 146 n 3742 Jul 1 1988 4p.

**Management** See Also INVENTORY CONTROL—Mathematical Models; JOB ANALYSIS; MACHINE SHOPS—Process Control; PAPER AND PULP MILLS—Quality Control; PRODUCT DESIGN—Optimization; PRODUCTION CONTROL—Scheduling; RELIABILITY—Computer Simulation.

**087389 QUALITY CIRCLES: TWO KEYS TO SUCCESS.** The issue of whether QC failures can be traced to techniques that are incompatible with employees' attitudes toward learning, work measurement, or the organizational setting at the time the training is begun. Because quality

circle problem-solving techniques are designed mainly for controlling and measuring processes that are adaptable to statistical quality control (SQC) (i.e., manufacturing settings), using these techniques in settings less adapted to SQC may lead to employee dissatisfaction with the process and, thus, QC failure. Most QC implementation programs use the common curricula or training techniques. These techniques include both problem-solving techniques and processes for developing group and team dynamics. However, the chosen curriculum's applicability to the organization's climate, structure, and personnel is not usually examined as a possible cause of circle failures. 10 refs.

Bagwell, Timothy C. *Qual Prog* v 20 n 9 Sep 1987 p 57-59.

**087390 PROCESS IMPROVEMENT.** Improvement of product quality depends on: understanding customer needs, designing the product to meet those needs, the design of the production process, and the knowledge of the product and production process. The responsibility for quality improvement in the evolution of a new product crosses many departments of an organization. The focus must be on identifying and improving the key processes in each function of each department. The greatest benefits of improving quality will occur during the design of the product and of the manufacturing processes. The key factor for success in improving quality will be people learning. Statistical methods will enhance the process of learning, as will an emphasis on teamwork. Only through a proper managerial environment, with every person working on improving quality to enhance customer satisfaction, will organizations be able to compete in the international marketplace. 4 refs.

Moen, Ronald D.; Nolan, Thomas W. *Qual Prog* v 20 n 9 Sep 1987 p 62-68.

**087391 PARAMETRIC APPRAISAL OF THE JIT SYSTEM.** Using a simulation model, some salient parameters such as (a) scheduling rules, (b) the effects of pull demands level, (c) the effects of the production Kanban size and the minimum Kanban level, and (d) the significance of the job mix are evaluated. The study shows that a common prevailing practice of assigning greater priorities to jobs with higher pull frequencies is not as efficient as a shortest process time based rule. Raising the pull demand in a Just-In-Time (JIT) system does not ensure a high process utilization level. Results also show that an increase in the production Kanban size and minimum output Kanban level improve the mean job tardiness but causes an escalation in the output Kanban inventory level. An enlarged product mix would actually produce better process utilization and mean job tardiness. (Edited author abstract) 9 refs.

Lee, L.C. (Nat'l Univ of Singapore, Singapore). *Int J Prod Res* v 25 n 10 Oct 1987 p 1415-1429.

**087392 MANUFACTURING QUALITY DENSITY, CONTROL AND MAINTENANCE.** A measure of quality density in manufacturing is expressed in terms of a manufacturing process propensity to 'output' units which are defectives, as a function of the manufactured production output, the manufacturing deterioration process, maintenance, quality control, and generally the risks a manufacturing process is subjugated to. Particularly, we assume that the production process induces 'shocks' which lead to poorer manufactured quality, while maintenance efforts are continually being employed to restore the process propensity to produce units of better quality. Quality control is used then to monitor the output quality of units produced. Using a methodology of level crossing in stochastic point processes, the stationary probability distribution of a manufactured output quality is defined. (Edited author abstract) 15 refs.

**087393 PROJECT PLANNING NETWORK IS INTEGRATED PLAN FOR IMPLEMENTING JUST-IN-TIME.** The integrated plan consists of 11

major phases including the precedence relationships, associated input-output links and required activities of each phase. An integrated approach for planning and implementing a JIT operating environment is constructed in the form of a project planning network to determine the duration of the entire project, identify potential bottlenecks and highlight critical activities. The 11 phases of this integrated approach for implementing JIT cover planning and analysis activities, formulating operating systems, and evaluation and improvement functions. 10 refs.

Nisanci, Ibrahim (Bradley Univ); Nicoll, Andrew D. *Ind Eng* v 19 n 10 Oct 1987 p 50-55.

**087394 TAGUCHI'S QUALITY PHILOSOPHY: ANALYSIS AND COMMENTARY.** This paper is an introduction to an interpretation of Taguchi's ideas. The seven most important basic elements of Taguchi's quality philosophy are discussed in detail, with definitions of key expressions, and the author helps to relate these ideas to the published literature. He believes that the impact Taguchi has made on Japanese companies has important lessons for anyone wishing to set up an improved total quality control program. (Author abstract) 24 refs.

Kackar, R.N. (AT&T Bell Lab, USA). *Qual Assur* v 13 n 3 Sep 1987 p 65-71.

**087395 QUALITY ENGINEERING BY DESIGN: TAGUCHI'S PHILOSOPHY.** Taguchi's philosophy recognizes the importance of both off-line and on-line quality control in reducing variation and its effects to the minimum, and embraces the entire engineering and manufacturing process. This paper looks at key topics such as loss function, performance variations, signal to noise, system design, and parameter and tolerance design. This last topic includes a detailed example to demonstrate the philosophy in practice. The author believes that Taguchi's economic outlook on sampling and process adjustment is yet to be fully appreciated in the United States. (Author abstract) 3 refs.

Barker, T.B. (Rochester Inst of Technology, Rochester, NY, USA). *Qual Assur* v 13 n 3 Sep 1987 p 72-80.

**087396 PERSPECTIVE ON THE TAGUCHI METHODS.** This paper takes a critical look at the Taguchi Methods and discusses the main concepts with the aid of examples. The author puts these underlying concepts and philosophies into the context of more conventional statistical approaches to quality assurance. He argues that much of the contribution made by the Taguchi Methods derives less from novel methodology than from the way they make statistical techniques comprehensible and easy to use for non-experts. (Author abstract) 18 refs.

Gunter, B. *Qual Assur* v 13 n 3 Sep 1987 p 81-87.

**087397 POWER OF TAGUCHI METHODS.** During the past three years, there has been a significant change in US quality thinking and engineering technology through the application of the Taguchi Methods. Although this change has developed slowly due to statistical controversy, this technology is beginning to have a great effect on US products. Applying the Taguchi Methods can significantly shorten the product development cycle, improve quality and reduce cost for US companies. (Edited author abstract)

Sullivan, L.P. (American Supplier Inst Inc). *Qual Assur* v 13 n 3 Sep 1987 p 88-90.

**087398 JUST-IN-TIME: MEETING THE COMPETITIVE CHALLENGE.** The article examines the way in which manufacturers have had to meet the challenge of stopping the decrease in the growth of American productivity, market share and profits. Successful implementation of just-in-time (JIT) and its requisite technologies can counteract the decline of American manufacturing with low cost/high quality products. Successful implementation of JIT and its requisite technologies will create a manufacturing environment that can meet the competitive challenges to American manufacturing with low-cost, high-quality products. JIT has proven to be an effective

execution system and, in combination with the planning and controls of its peripheral systems like materials requirement planning (MRP), robotics, and automation, can help American manufacturing increase its share of the world market. 10 refs.

Hannah, Kimball H. *Prod Invent Manage* v 28 n 3 3rd Quarter 1987 p 1-3.

**087399 SOME CONCLUSIONS ABOUT JIT MANUFACTURING.** This article presents some personal experiences with companies implementing just-in-time (JIT), some generalizations important to implementers, and some serious concerns for the future. In so doing, the goal is to move toward the next phase of JIT - the development of ways to leapfrog the time barriers imposed by incremental improvement and learning curve limitations. The bases of the article are the two APICS Study Missions which the author has made to Japan, interactions with other professional JIT implementers and discussions with senior management. 13 refs.

Burnham, John M. (Tennessee Technological Univ, Cookeville, TN, USA). *Prod Invent Manage* v 28 n 3 3rd Quarter 1987 p 7-11.

**087400 EASIER QUALITY CONTROL: COMBINING PROBLEM CLASSIFICATION WITH TIME SERIES ANALYSIS.** Operations managers sometimes fail to take advantage of effective techniques for quality assurance. This article introduces a new streamlined approach to statistical quality control; Acar's problem classification scheme is combined with current statistical methodology. The proposed method provides a more systematic approach to quality assurance and a smoother implementation than many current systems. The suggested approach is particularly suited for on-line use in real time as, for example, part of a flexible manufacturing system. 21 refs.

Acar, William (Kent State Univ, Kent, OH, USA); Booth, David E. *Prod Invent Manage* v 28 n 3 3rd Quarter 1987 p 53-58.

**087401 SYSTEMATIC PRODUCT-BREAKDOWN AND DOCUMENTATION, MAJOR TOOLS FOR PRODUCTIVITY IMPROVEMENT.** It will be shown that by developing the breakdown of the product into modules, assemblies and parts can be a major tool for improving productivity. In industries with a variety of product versions and customer requirements, the benefits are a shorter lead-time of orders and less stock. The challenge is to respond to a variety of functions and function requirements of the different product 'parts' with a minimum of different hardware elements and connections. Intending this, the engineer has a specific need for a reliable and rapidly accessible documentation system. An outline of such a system is given. (Author abstract) 5 refs.

Bikker, H. (Delft Univ of Technology, Delft, Neth); Van der Heyden, W. *Int J Prod Res* v 25 n 11 Nov 1987 p 1635-1644.

**087402 QUALITY AND PRODUCTIVITY: AN EXAMINATION OF SOME RELATIONSHIPS.** Two hypothetical mathematical relations between quality and productivity are presented. Net production and cost consequences of the two are examined. An empirically developed relation is also provided as indication that productivity improvement effort require study by quality assurance personnel. Suggestions for such study efforts are discussed. (Edited author abstract) 6 refs.

Hotard, Daniel G. (Southeastern Louisiana Univ, Hammond, LA, USA). *Eng Manage Int* v 4 n 4 Jan 1988 p 259-266.

**087403 JIT PURCHASING AS A QUALITY AND PRODUCTIVITY CENTRE.** Recently, Just-in-Time (JIT) purchasing practices have been recognized as a cornerstone of Japan's success in improving product quality and productivity. Traditionally, however, US

firms have treated purchasing functions as a 'profit centre'. This paper presents the proposition that US firms must recognize the potential of purchasing activities as 'quality and productivity centres' through successful implementation of JIT purchasing. Personal interviews have been conducted at four US manufacturing firms in an effort, first, to identify the major activities of JIT purchasing that have favorable effects on product quality and productivity and, second, to describe how these activities can improve product quality and productivity in US firms. (Author abstract) 7 refs.

Ansari, A. (Seattle Univ, Seattle, WA, USA); Modarress, Batoul. *Int J Prod Res* v 26 n 1 Jan 1988 p 19-26.

**087404 SOME FACTORS TO CONSIDER IN DEVELOPING A QUALITY-RELATED FEEDBACK SYSTEM.** This paper reports on work which has been carried out in an attempt to identify some of the key factors in the development of a quality-related feedback system associated specifically with major installations. The information being generated by users of computerized maintenance systems has, to date, been little used by manufacturers to initiate quality-improving changes. However, most manufacturers said they would use such data if it was offered. It is also pointed out that designers can play a key role in improving the quality of plant and equipment by requesting feedback information in those areas where there might be design uncertainty and by giving consideration to the possibility of condition monitoring when a product is being designed. (Edited author abstract) 12 refs.

Staveley, J.C. (Shell UK Ltd, Chester, Engl); Dale, B.G. *Qual Reliab Eng Int* v 3 n 4 Oct-Dec 1987 p 265-271.

**087405 DEMING'S WAY.** This paper discusses the teaching of W. Edwards Deming in Japan, which emphasizes lower costs due to higher quality of manufactured goods. Management systems for machines and people emphasize statistical methods, encouraging pride in workmanship, modern training methods and better communication between worker and management.

Tribus, Myron (AKT Systems & Energy Co, Hayward, CA, USA). *Mech Eng* v 110 n 1 Jan 1988 p 26-30.

**087406 USE OF STATISTICAL PROCESS/QUALITY CONTROL IN THE DEFENSE INDUSTRIES.** In 1987 a survey on quality was sent to 120 aerospace and electronics defense contractors (and some of their major divisions) throughout the nation. Half of the top 50 defense contractors in the nation participated. The survey was extensive (10 pages long) and covered issues of a more general nature relating to quality improvement efforts and philosophy. One section applied to the use of statistical process/quality control. In this section, use of SPC, training, administration and methods utilized were covered. This article addresses the responses to this section of the survey only.

ReVelle, Jack B. (Hughes Aircraft Co); Harrington, Hugh Jordan. *Ind Eng (Norcross GA)* v 20 n 2 Feb 1988 p 36-40.

**087407 SYSTEMS APPROACH TO THE IMPLEMENTATION OF JIT METHODOLOGIES IN LUCAS INDUSTRIES.** Competitive modern manufacturing business must operate total materials flow control systems to ensure low stock levels and short lead times. When a variety of products is produced, to achieve just-in-time operation relevant to the overall business time-constants, composite control systems are needed within the factory. These are supported by matching supply processes and levelled output scheduling. (Author abstract) 7 refs.

Parnaby, J. (Lucas Industries, Birmingham, Engl). *Int J Prod Res* v 26 n 3 Mar 1988 p 483-492.

**087408 PROTOTYPE EXPERT SYSTEM FOR SELECTING CONTROL CHARTS.** The emergence of expert systems provides new insight to specialists in manufacturing as a means of solving problems in their domains. The solutions of most manufacturing problems

are not deterministic and many alternate courses of action exist. In this paper, the structure of a prototype expert system, which provides support to the process or quality engineer in the selection of the proper type of control charts to use in tracking the state of the process, is explained. The functionality and operation procedures for executing this system are demonstrated on sample consultations and evolution of the system in time to reinforce existing input knowledge bases is described. (Author abstract) 17 refs.

**087409 MOVING FROM MANUFACTURING RESOURCE PLANNING TO JUST-IN-TIME MANUFACTURING.** Moving toward just-in-time (JIT) requires significant companywide effort. It means re-educating people, changing business policies and practices, and, finally, altering the information systems that support the production function. This article outlines the impact that JIT can have on these systems and suggests ways of handling the changes required. 22 refs.

Rao, Ashok (Babson Coll, Wellesley, MA, USA); Scheraga, David. *Prod Invent Manage J* v 29 n 1 1988 p 44-49.

**087410 DEMING - A PROPHET WITH NEW HONOUR.** The author describes Dr. W.E. Deming's philosophy of quality management, which will form a key part of an innovative quality management programme currently being developed by Ashridge in conjunction with the University of Tennessee. The Ashridge programme 'Improving Productivity through Quality' looks at what Deming has taught the Japanese, through some of his now celebrated - and still evolving - 'Fourteen Points for Management'.

Knight, Mike (Ashridge Management Coll, Engl). *Prod Eng (London)* v 67 n 4 Apr 1988 p 58-59.

**087411 STUDY OF JIT IMPLEMENTATION AND OPERATING PROBLEMS.** This paper reports the results of a survey of early implementers of the just-in-time (JIT) philosophy in the United States with particular emphasis on the identification of implementation problems and operating problems. There were 39 respondents to the survey who were in the process of implementing JIT. Five classes of implementation problems and eight classes of operating problems were identified. (Author abstract). 2 Refs.

Crawford, Karlene M. (Univ of Georgia, Athens, GA, USA); Blackstone, John H.; Cox, James F. *Int J Prod Res* v 26 n 9 Sep 1988 p 1561-1568.

**087412 'FAKE PULL' IN A KANBAN ENVIRONMENT: ACCEPTABLE TRADE-OFF OR VIOLATION OF PRINCIPLE?** The author believes that it is acceptable to violate this philosophy under certain conditions. If a manufacturing organization is considering implementing a fake pull concept, they should carefully evaluate the trade-offs and the conditions which can make it the correct decision and then develop contingency plans for the range of likely situations which would be candidates for this action. If these conditions are not met, then it is probably best to avoid a fake pull and, instead, to stop the line and bring pressure to bear to fix the problem. 8 Refs.

Hendrick, Thomas E. (Arizona State Univ, Tempe, AZ, USA). *Prod Invent Manage J* v 29 n 2 1988 p 6-9.

**087413 INFORMATIONAL AND ORGANIZATIONAL IMPACTS OF IMPLEMENTING A JIT SYSTEM.** The fundamental differences between JIT and traditional manufacturing processes are detailed. A JIT system and the types of information needed in a JIT environment are described. Some implications of converting to and operating a JIT system are discussed. 14 Refs.

Malley, John C. (Univ of Mississippi, University, MS, USA); Ray, Ruthann. *Prod Invent Manage J* v 29 n 2

1988 p 66-70.

**087414 PLANT 2 IS NUMBER ONE AT TRANE.** The article discusses how a quality improvement program helped to reduce costs and boost efficiency in an air conditioner manufacturing plant. Management commitment, quality awareness and recognition are some steps in the program that were given emphasis on. The backbone of the program are the error cause removal forms (ECR's).

Stratton, Brad (Quality Progress, Milwaukee, WI, USA). *Qual Prog* v 21 n 8 Aug 1988 p 27-30.

**087415 MEETING THE WORLDWIDE QUALITY CHALLENGE.** The evolution of the quality movement in the United States is divided into three periods wherein quality professionals are characterized as: advocates for statistical quality control; administrators for systems of quality control; advertisers selling quality consciousness. The U.S. must emphasize management, quality consciousness in organizational culture and quality technology. 12 Refs.

Marquardt, Donald W. (DuPont, USA). *Qual Prog* v 21 n 8 Aug 1988 p 34-37.

**087416 SIX STRATEGIES FOR BEGINNING THE QUALITY TRANSFORMATION, PART II.** Top managers learn to become leaders, exemplars and teachers of quality. Managers establish improvement projects that are carefully selected and guided by managers, conducted by cross-divisional teams using the scientific approach and coached by technical advisers. Top managers engage in quality transformation planning starting with a two-year blueprint for preparation, start-up and early expansion. Managers establish processes for the internal coordination, oversight and technical training and assistance needed to support quality improvement programs. Managers undertake specific efforts to change the organization's culture. Education and training are necessary to support the quality efforts. 12 Refs.

Scholtes, Peter R.; Hacquebord, Heero. *Qual Prog* v 21 n 8 Aug 1988 p 44-48.

**087417 GLOBAL SEARCH FOR QUALITY.** It is the supplier's responsibility to illustrate how its customers' requirements and expectations are translated into concrete specifications and physical action overseas. To achieve quality, it is important to adhere to the following: international regulations; communication; cultural context. The results of such attention to quality are: reduced manufacturing time; enhanced customer satisfaction; scrap reduction/rework elimination; easy housekeeping; enhanced management.

Yaus, Leo P. (Int Components Corp, Chicago, IL, USA). *Qual Prog* v 21 n 8 Aug 1988 p 51-53.

**087418 TOTAL QUALITY CONTROL WITH ACCENT ON PRODUCTION QUALITY MANAGEMENT.** The concept of quality loss function is discussed with an example. The difference between manufacturing tolerances and product tolerances is also illustrated. The importance of design of experiments for process improvement has been stressed. Difference between planned experimentation and conventional or classical experimentation has been explained with a view to stress the highly predictable results of the former. A few examples from American industry and some examples from Indian industry have been given to indicate what improvement are possible with designed experiments. (Edited author abstract). 21 Refs.

Puppala, B. (Jyoti Ltd, Baroda, India). *J Inst Eng India Part PR* v 69 n PR 1 Jul 1988 p 11-16.

**087419 PEOPLE: THE ONLY THING THAT WILL MAKE QUALITY WORK.** The manager of the Dow Chemical Company's aspirin facility found that employees are the key to continuous improvement. Under the Quality Service and Product Performance Program is a task force program wherein the employees give suggestions on

quality improvement. The results include almost a 50% improvement in attendance and a 28% reduction in manpower; off-grade production decreased by a factor of six, on-time shipment increased to 99.2%, and customer relations improved. And product quality, combined with the attitude that Dow would gladly work with the customer, were recognized throughout the industry. The improvements also paid off in another important parameter: employee morale. 1 Ref.

Bemowski, Karen (Quality Progress, Milwaukee, WI, USA). *Qual Prog* v 21 n 9 Sep 1988 p 63-67.

**087420 SUPPLIER CERTIFICATION-A POSITIVE RESPONSE TO JUST-IN-TIME.** The criteria for supplier certification are: having virtually no product-related lot rejections for a significant time period; having no nonproduct-related rejections for a stated period of time; having no production-related negative incidents for a stated period of time; having successfully passed a recent on-site quality system evaluation; having an agreed-upon specification; having a fully documented process and quality system; having the ability to furnish timely copies of certificates of analysis, inspection data, and test results; certification of bulk suppliers requires the correlation and validation of laboratory results; and the certification requirement for piece part or assembly suppliers is a demonstration of statistical process control. Supplier certification is important to remain competitive, thus attain greater quality; as an answer to just-in-time manufacturing, and because of the desire for peace and quiet.

Maass, Richard A. (Digital Equipment Corp, Salem, NH, USA). *Qual Prog* v 21 n 9 Sep 1988 p 75-80.

**087421 THREE LEVELS OF QUALITY.** An organization committed to an ongoing focus on quality must examine quality at three levels: organization, process, and individual. At each level, the organization needs to define its quality systems and standards, and then manage quality through improvement efforts. The organization that manages these three levels of quality creates a system context for its quality awareness education, its culture change efforts, and its quality monitoring and problem-solving tools. The organization, process, and individual levels are interdependent, linked together in a total system that ultimately determines the quality of an organization's products and services.

Brache, Alan P. (Rummeler-Brache Group); Rummeler, Geary A. *Qual Prog* v 21 n 10 Oct 1988 p 46-51.

**087422 ROOTS OF UNQUALITY.** Analysis of the national unquality problem indicates the following root causes: lack of knowledge and understanding of the quality discipline; failure by institutions of higher learning to provide degree programs in quality management and engineering; the emphasis by the Department of Defense (DOD) on endless audits and failure/penalty costs; ASQC's traditional emphasis on training, rather than professional education; Blind worship of the bottom line by short-term-motivated management; The constant adjustment of the work force to maximize profits regardless of its effect on quality. American business still faces significant problem areas: senior management, employee turnover, education, and the defense contracting system. The article examines each of these. 2 refs.

Goldstein, Raymond (Inst of the Electrical & Electronics Engineers). *Qual Prog* v 21 n 10 Oct 1988 p 55-58.

**087423 DISCOVERED: QUALITY'S MISSING LINK.** The quality cost system is a missing link in the flow of information from accounting back to production and quality management. A quality cost system (QCS) is an informational system that provides both instantaneous measurement and continual tracking of: total quality cost; the contribution of the five major categories (prevention, appraisal, failure, internal failure, and external failure); and any number of meaningful cost-benefit ratios such as total quality cost/sales, or procurement appraisal cost/purchased material cost. The use of system dynamics models in quality management system is presented. 5 refs.

Batson, Robert G. (Univ of Alabama, USA). *Qual Prog* v 21 n 10 Oct 1988 p 61-64.

**087424 AVOID THE JUST-IN-TIME TERRORS.** Successful operation as a just-in-time (JIT) manufacturer requires that the company first operate successfully with total quality assurance (TQA) principles. Design integrity, manufacturing repeatability, strong supplier-customer partnerships, and a clear understanding of the needs of the marketplace are key to the success of TQA and later for JIT manufacturing. Design engineering must adhere to product specifications and provide designs that are correct, complete, and manufacturable. Management must also provide training at every level so that all employees clearly understand their work, what they will be expected to do, what tools are necessary to do the job, and how to use the tools.

Westland, Cynthia Lane (Total Quality Systems Co, Lexington, MA, USA). *Qual Prog* v 21 n 10 Oct 1988 p 69-70.

**087425 QUALITY PLAN DEVELOPMENT: A KEY STEP TOWARD CUSTOMER ENTHUSIASM.** Some key attributes that quality professionals must possess to assist their business in achieving customer enthusiasm are: integrity, listening and communicating, cooperating, innovating, and leadership. A sound quality plan, developed and implemented in conjunction with these attributes, will move the business closer to success. An eight-step process for implementing quality improvement includes: obtaining management commitment; team forming; developing a vision; developing a policy statement; developing objectives and guidelines; reviewing current programs/projects; developing/implementing a formal review process; implementing the plan. 1 ref.

**087427 QUALITY IMPROVEMENT PROCESS WITHIN PLESSEY TELECOMMUNICATIONS SYSTEMS LTD.** Over the past four years Plessey Telecommunications Systems Ltd has been examining its management of quality and developing a quality strategy that will enable the business to thrive in the international market. This paper describes the processes used in undertaking the first phase of a lasting quality improvement process. The substantial improvements documented in this submission were achieved within the traditional framework of BS 5750. These improvements were in the areas of design, component assessment, manufacturing and test, reliability and training. 5 refs.

## Mathematical Models

**087431 PRODUCTION LEARNING AND QUALITY CONTROL.** This paper establishes a linkage between quality control, the production learning process and the firm's propensity to use quality control under various conditions. A stochastic dynamic programming approach together with a numerical example are used to compute quality control policies and justify the intensive use of quality control in manufacturing. Although the problem is formulated in general terms, a specific application using a curtailed sampling technique for quality control is solved completely. This solution is also used to discuss the various conditions under which quality control is used and the relationships of the quality control policy with learning and experience. (Edited author abstract) 31 refs.

Tapiero, Charles S. (Hebrew Univ). *IIE Trans* v 19 n 4

Dec 1987 p 362-370.

**087432 QUALITY CONTROL MODEL WITH LEARNING EFFECTS.** We present a model that extends a variant of the classic quality control/machine maintenance model by adding the concept of quality-based learning. The extension captures the idea that operators of a production process may be able to discover and eliminate defects in the system if, during an inspection, they find the process to be 'out of control'. Thus, the distinguishing feature of the model is that one inspects the process not only for the purpose of repairing the machine, but also in the hope that the machine will be caught in the act of producing defective output, so that a source of problems is uncovered and eliminated. The paper provides a characterization of optimal inspection policies. (Edited author abstract). 18 Refs.

Fine, Charles H. (MIT, Cambridge, MA, USA). *Oper Res* v 36 n 3 May-Jun 1988 p 437-444.

## Military Applications

**087433 NEW SPECS PENETRATE NDT INDUSTRY.** Two recently published military specifications pertaining to the liquid penetrant inspection process are now affecting the nondestructive testing (NDT) industry. One, MIL-I-25135D, controls the characteristics and quality of penetrant materials; the other MIL-STD-6866, controls how these materials are used. The two specs, under the jurisdiction of Grover Hardy, materials laboratory engineer at Wright-Patterson Air Force Base (WPAFB), were published with both military and commercial participation. The most significant advancement of MIL-I-25135D is the way in which sensitivity, or the penetrant's ability to find cracks, is evaluated. MIL-STD-6866, which governs the use of penetrants, incorporates the past 20 to 25 years of knowledge on the causes of penetrant system failure into one document.

Sherwin, Amos G. *Qual Prog* v 20 n 9 Sep 1987 p 77-78.

## Monitoring

**087434 EXACT RESULTS FOR SHEWHART CONTROL CHARTS WITH SUPPLEMENTARY RUNS RULES.** This article gives a simple and efficient method, using Markov chains, to obtain the exact run-length properties of Shewhart control charts with supplementary runs rules. Average run-length comparisons are made among the Shewhart  $\bar{X}$  chart with supplementary runs rules, the basic Shewhart  $\bar{X}$  chart, and the cumulative sum (CUSUM) chart. (Author abstract) 14 refs.

Champ, Charles W. (Southern Illinois Univ, Edwardsville, IL, USA); Woodall, William H. *Technometrics* v 29 n 4 Nov 1987 p 393-399.

**Optimization** See Also PRODUCT DESIGN—Reliability.

**087435 BEEFING UP QC.** The data collection process for quality control (QC) is streamlined by a personal computer (PC). A basic computer program is used on the PC to facilitate the downloading of collected data into spreadsheets. By using the device, the need to write the QC readings on paper to be fed later into the PC was eliminated. Because the Datacomputer is programmable, a program is created that, after readings are keyed in, will provide an average of the 10 readings entered, as well as tell the operator whether the readings are within specification ranges.

**Sampling** See Also GARMENT MANUFACTURE—Quality Assurance; INSPECTION—Human Factors; MACHINE TOOLS—Quality Control; PROCESS CONTROL—Optimization; PRODUCT LIABILITY—Economics.

**087436 QUALITY CONTROL SAMPLING PLANS UNDER ZERO INVENTORIES: AN ALTERNATIVE**

**METHOD.** The nature of zero inventories and the related quality management concepts are discussed. The author reports an alternative QC methodology, called constant gross inspection (CGI), which has been practiced by some firms in east Asian nations such as Taiwan and Japan. Most of these firms have adopted some formal or informal systems which incorporate the zero-inventory philosophy. The assumptions behind the CGI method are basically consistent with the spirit of the zero-inventory philosophy. 6 refs.

Chung, Chen-Hua (Univ of Kentucky, Lexington, KY, USA). *Prod Invent Manage* v 28 n 2 Second Quarter 1987 p 37-42.

**087437 IMPROVEMENT OF VARIABLE SAMPLING PLANS BASED ON KULLBACK-LEIBLER INFORMATION.** A new and convenient design procedure for single sampling plans by variables is given by Arizono and Ohta (1986) based on the Kullback-Leibler information. In this paper an improvement of the original design procedure is presented and the revised procedure is compared with the Bayesian procedure. It is shown that the revised procedure is more applicable and exact than the original procedure, and is reduced to the Bayesian procedure in a special case. (Edited author abstract) 1 ref.

Arizono, Ikuo (Univ of Osaka Prefecture, Sakai, Jpn); Ohta, Hiroshi. *Int J Prod Res* v 25 n 9 Sep 1987 p 1393-1400.

**087438 MARRIAGE OF ZERO INVENTORIES AND CONDITIONAL SAMPLING PROCEDURES.** As the movement to zero-inventory pull-system lot quantities gains favor, inspection costs can dramatically increase when using sampling plans found in MIL-STD-105D. Conditional multiple sampling procedures presented herein will reduce the total inspection cost while maintaining adequate consumer/producer protection. These procedures must naturally be accepted and approved by the procuring authority and/or prime contractor. Not only will the total inspection level remain moderately small, but conditional sampling procedures allow you to utilize relevant sample information from related lots, which makes intuitive sense. If zero-inventory concepts are to be successfully implemented, the impact on other parts of the production process must be addressed and solved. 3 refs.

Baker, R.C. (Univ of Texas/Arlington, Arlington, TX, USA). *Prod Invent Manage* v 28 n 3 3rd Quarter 1987 p 27-30.

**087439 MULTIOBJECTIVE DECISION ANALYSIS FOR ACCEPTANCE SAMPLING PLANS.** This paper illustrates an approach to the design of Bayesian sampling plans which considers two criteria. The few previous attempts to design multiobjective Bayesian sampling plans have been based on expected values of the criteria. In this paper the authors present a design methodology which takes into consideration the distribution functions of the criteria after sampling inspection, and the utility function of the 'decision maker'. Illustrative examples of the use of the methodology are given as well as areas for further research. (Edited author abstract) 30 refs.

Evans, Gerald W. (Univ of Louisville, Louisville, KY, USA); Alexander, Suraj M. *IIE Trans* v 19 n 3 Sep 1987 p 308-316.

**087440 INSPECTION ERROR EFFECTS ON PERFORMANCE MEASURES OF A MULTISTAGE SAMPLING PLAN.** This paper generalizes previous work on double sampling to multistage sampling. It provides expressions for the O.C. curves, average outgoing quality and average total inspection in the presence of inspection error for all combinations of sample by lot dispositions. Furthermore, the sensitivity analysis is carried out from a more general algebraic standpoint. (Edited author abstract) 11 refs.

Maghsodloo, Saeed (Auburn Univ, AL, USA). *IIE Trans* v 19 n 3 Sep 1987 p 340-347.

**087441 MONITORING AS ESTABLISHING QUALITATIVE DEFINITENESS IN AN OBJECT.** Qualitative definiteness (quality) expresses an essential definiteness indistinguishable from the existence of the object, on account of which it is what it is and not some other object. A given object will have a set of different qualities, because each object can be evaluated from various viewpoints. Qualitative definiteness in an object is the objective essence of it, since it reflects what it objectively is and is independent of human consciousness of it. By property is meant the occurrence of an internal nature in the thing or object demonstrated by its interaction with other things. 7 refs.

**087442 DISTRIBUTION OF DEFECTIVES DUE TO INSPECTION ERRORS IN 100% INSPECTED LOTS.** The occurrences of the error-failure to detect a defective unit-by the inspectors are described by Poisson distributions. The Poisson distributions are then mixed using a gamma distribution to reflect diversity among the inspectors in terms of their speed of inspection, skill, frequency of assignment to inspect the product, etc. The resulting compound distribution, which is the distribution of defectives in the inspected lots, turns out to be a negative binomial distribution. Estimation techniques to estimate the parameters the negative binomial distribution from sample data and the method to update the distribution of defectives in the lots using Bayesian technique are presented. Several numerical examples of the techniques are also provided. (Edited author abstract) 33 refs.

Dhaval, Dileep G. (Clark Univ, Worcester, MA, USA). *Int J Prod Res* v 25 n 12 Dec 1987 p 1729-1738.

**087443 SIMPLIFIED DESIGN PROCEDURE FOR MINIMAX SAMPLING PLANS BY ATTRIBUTES.** A minimax criterion was introduced by Fujino and Okuno (1981) for the unique determination of single sampling plans by attributes with given producer's and consumer's risk. A procedure was also proposed by them to get sampling plans based on a minimax criterion. A simplified design procedure for the minimax sampling plans is presented. The proposed procedure is based on a regression relationship in variates derived from the Wilson-Hilferty approximation. For practical purposes, some tables for designing the desired sampling plans are provided. (Edited author abstract) 13 refs.

Ohta, Hiroshi (Univ of Osaka Prefecture, Sakai, Jpn); Kanagawa, Akihiro. *Int J Prod Res* v 26 n 1 Jan 1988 p 143-156.

**087444 QUALITY CONTROL OF AN UNRELIABLE RANDOM FMS; WITH BERNOULLI AND CSP SAMPLING.** This paper provides a set of recursive equations for computing the AOQ (average outgoing quality) of an unreliable random FMS (flexible manufacturing system). The FMS is described using Whitt's approximation to a network of GI/G/S queues. Relationships between the operating and quality manufacturing characteristics of the FMS are found. Numerical examples are provided and the impact of outgoing quality variability on location of inspection in an FMS is discussed. This latter topic is left for further research however. (Author abstract) 16 refs.

**087446 DETERMINATION OF SINGLE-SAMPLING-ATTRIBUTE PLANS BASED ON MEMBERSHIP FUNCTIONS.** In using exact sampling plans, cases often arise in which large sample size is needlessly sought. A minimax criterion which relaxes the conditions on the risks for reducing the sample size was introduced by Fujino and Okuno. This paper presents a design procedure for relaxing the conditions on the risks by the membership functions used in fuzzy methodologies. The proposed procedure is general because it includes sampling plans based on the minimax criterion and exact sampling plans in the special cases. (Edited author abstract). 9 Refs.

**Standards** See Also INDUSTRIAL PLANTS—Quality Control; INSTRUMENTS—Calibration; NONDESTRUCTIVE EXAMINATION—Dyeing; QUALITY ASSURANCE—Management.

**087447 NEGOTIATING ZONES.** In any discussion of specifications, and particularly in one dealing with questionable lots beyond the traditional 'specification' limits, one must state that this is not in conflict with Taguchi's loss function. All companies should urge or even require their suppliers to not only meet specifications, but be centered and of sufficiently low variability that a process capability index ( $C_p$ ) of 1.3 can be met or exceeded. Establishing a negotiating zone in specifications should not take the place of effective and economical process control, but it can be used for those instances where the customer does not yet understand fitness-for-use criteria; the extensive experimentation would be prohibitively expensive due to cost of materials and products; conservative limits are required due to the high cost of using a run or lot of material not fit for use.

Burr, John T. *Qual Prog* v 20 n 9 Sep 1987 p 38-39.

**087448 PRODUCT QUALITY THROUGH THE STANDARD.** Improvement of product quality is the source of increase in labor productivity, conservation of resources, and expansion of trade relations. In this area a positive effect is exerted by the product quality control system, based on a system of interrelated standards regulating all preliminary and basic stages - from project and design developments to the quality of final products. The plant services developed more than thirty standards of this system, covering all stages of production: from input monitoring of feedstock to output monitoring of the quality of finished products. The principal type of product of in the authors plant is coal coke, which is used in nonferrous metallurgy. The comprehensive system permitted us, proceeding from feedstock quality, to achieve flexible control of the technological process, and as a result the quality indices of the finished coke were significantly higher than the specifications of the GOST standard. The plant adopted three-stage monitoring of the observance of technology to achieve the required product quality.

**087449 DEVELOPMENT OF THE BS 5750 CONCEPT OF TOTAL QUALITY SYSTEM PROCEDURES.** The author traces the evolution of quality control from the industrial revolution to the present day. The adoption by the Japanese of quality control is discussed. An examination is made of BS 5750 which provides the framework for a quality management system that is effective within our culture, and can serve as a catalyst for establishing good management practices. It operates at the three levels of company policy, internal systems, and specific requirements. It is a 20-point check list that top management can use as an instrument to

change practices and secure the involvement of staff at every level. The headings apply in all situations, and comprehensive explanation of the requirements and guidance notes appear in the published specification. The interpretation of the concepts for a particular company must be developed and personalized by their own staff, and summarized in their 'quality system manual'. The three certifying bodies that assess conformance to the requirements of BS 5750 are given. 11 Refs.

**087454 SUPERSYMMETRIC CASIMIR EFFECT IN FLAT HOMOGENEOUS CLIFFORD-KLEIN SPACE-TIME.** The Casimir effect in supersymmetric quantum field theories can occur in space-time with nontrivial topologies, due to the existence of topologically nonequivalent field configurations. This possibility is considered for the example of the supersymmetric Wess-Zumino model and the  $N=1$  supersymmetric Yang-Mills theory in flat homogeneous Clifford-Klein space-time with the topologies  $M_n = (S^1)^n \times R^{4-n}$ ,  $n=1, 2, 3$ . The occurrence of the Casimir effect in this situation is interesting from the point of view of constructing sensible cosmological scenarios of the early stages of the evolution of the Universe, in particular, the expanding Universe scenario. (Author abstract) 18 refs.

**087457 WORLD AS SYSTEM SELF-SYNTHESIZED BY QUANTUM NETWORKING.** The quantum, strangest feature of this strange universe, cracks the armor that conceals the secret of existence. In contrast to the view that the universe is a machine governed by some magic equation, we explore here the view that the world is a self-synthesizing system of existences, built on observer-participancy via a network of elementary quantum phenomena. The elementary quantum phenomenon

in the sense of Bohr, the elementary act of observer-participancy, develops definiteness out of indeterminism, secures a communicable reply in response to a well-defined question. The rate of carrying out such yes-no determinations, and their accumulated number, are both minuscule today when compared to the rate and number to be anticipated in the billions of years yet to come. The coming explosion of life opens the door, however, to an all-encompassing role for observer-participancy: to build, in time to come, no minor part of what we call its past - our past, present, and future - but this whole vast world. (Author abstract)

Wheeler, John Archibald. *IBM J Res Dev* v 32 n 1 Jan 1988 p 4-15.

**087458 QUANTUM DECAY AT A FINITE TEMPERATURE.** The phenomenon of quantum decay of a metastable state at a finite temperature is investigated. The case of a non-quasi-classical potential and optical dissipation is examined. It is shown that there is no shift from a mode of quantum tunneling to a mode of thermal activation in an approximation of the lifetime for such a potential. A general expression is found for the rate of decay, and it is investigated in different special cases. (Author abstract) 5 refs.

**087463 CONCEPTION OF GLUON DOMINANCE AND MULTIHADRON PRODUCTION.** Qualitative arguments are discussed for the model of gluon dominance (MGD) of the multihadron production process in hadron and relativistic nuclei interactions. Interpretations are given of basic regularities of the multi-hadron production in hadron collisions in the concrete variant of MGD-model of two-gluon fusion. Requirements are formulated for the behavior of the cross section of such a fusion following from the analysis of the production process. (Author abstract) 49 refs.

## QUARRIES AND QUARRYING

**087472 SOCIETE DES KAOLIN D'ARVOR: IMPORTANTES POSSIBILITES EN VOIE DE DEVELOPPEMENT.** [Arvor Kaolin Co.: Important Possibilities in Development]. On the Atlantic coast near Lorient, at a spot called Kergantic of the parish of Pleumeur, are located the quarry and the processing plant of the Arvor Kaolin Co. They present quite an unusual landscape. The whitish spoil heaps can be observed very far from the shore over the ocean. Some of the topics covered include Kaolin Treatment, and mica preparation. In French.

Anon. *Ind Miner Mines Carrieres* v 69 Nov 1987 p 571-574.

**087473 TARMAC LIMESTONE MINE CLEANS UP WITH NEW FILTER PLANT.** Once beset with emission and filter maintenance problems at a Derbyshire Limestone mine, Tarmac Quarry Products took the decision over five years ago to install new filter plant containing nearly 500 new style membrane filter bags. Pressure from local residents has long since ceased and now the mine's filtration system operates at over one thousand times the atmospheric emission efficiency level laid down by the Health and Safety Executive. (Author abstract)

Anon. *Mine Quarry* v 17 n 4 Apr 1988 p 27.

**087474 DISTRIBUTION OF QUARRIED MATERIALS.** Quarry products are characterized by high-volume (tonnage) flows of material having an intrinsically low value. As a result, a reduction in unit transport costs has been sought through economies of scale. Some topics discussed in this regard are the following: roads; rail; water transport; the future and its constraints (road, rail, and sea transport); and alternative methods. 6 refs.

Wilson, Herb (ARC Southern). *Quarry Manage* v 15 n 4 Apr 1988 p 33-35.

**LING, BLASTING COST.** An advanced emulsion/ANFO blend bulk explosives system has helped a Michigan quarry solve some difficult blasting problems and in the process reduce overall drilling and blasting costs up to 7%. The quarry is the Rockwood, Mich., silica sand and limestone operation of U.S. Silica, Michigan. The quarry produces about 300,000 tons of silica a year which is processed into sand for the glassware industry and silica sand for foundries.

Tarantino, Teresa. *Pit Quarry* v 80 n 3 Sep 1987 p 40, 42.

**087480 DIMENSIONAL STONE BLASTING IN FINLAND.** Smooth Blasting techniques are finding increasing use. They are already employed in large underground civil engineering works. The next logical step would be to use these methods in the development of long-term underground excavations needed in mines for large underground crusher houses, pump chambers and workshops. The techniques used in Finland for producing quarried dimension stone are described.

Smith, Mike. *Min Mag* v 157 n 4 Oct 1987 p 312-313, 315-317.

**087481 RECENT ADVANCES IN OPEN-PIT BLASTING.** This paper describes the recent major developments associated with coal overburden blasting that have led to these efficiency gains. It is hoped that quarry operators may become fully aware of these technical advances, so that this efficiency may be rapidly translated to their environment, allowing the same degree of competitive edge to occur in the domestic markets. The fast-growing minerals industry of the 1960s was quick to seize on the advantages of low-cost ANFO in all dry blasting applications. Research and development efforts were geared towards the development of the early water-proof slurry explosives. These were later refined to the small-diameter packaged water-gels such as Tovex, with its patented sensitizer MMAN.

Talbot, David (DuPont Ltd, Aust). *Quarry Manage* v 15 n 3 Mar 1988 p 31-32, 34.

**087482 LASER PROFILING AT MOORCROFT QUARRY.** If proposals for new Regulations and an Approved Code of Practice covering the use of explosive in quarries come into force, the changes relating to surveying and profiling will lead to renewed interest in improving these techniques. One company which believes it has an ideal solution is Rockclasers Ltd, now acting as agents for manufacturers of the 'Quarryman' laser profiling system. The article describes the operating principles of the system.

Anon. *Mine Quarry* v 17 n 1-2 Jan-Feb 1988 p 19-22.

**087483 A REVIEW OF BLAST DESIGN CONSIDERATIONS IN QUARRYING AND OPENCAST MINING.** Good blasts are the result of the correct choice of explosives, and good blast design. The diameter, length and inclination of blast holes, drilling pattern, type, quantity and utilization of explosives, rock type, firing sequence and delay timing all have an effect on the efficiency of the overall operation. If the highest overall efficiency and highest safety standards are to be achieved, all blasts must be properly designed and recorded for future reference. This paper reviews the basic factors leading to good design and discusses the role of computer-aided design and in particular the SABREX computer blast model.

Ball, Malcolm (Nobel Explosives Co). *Quarry Manage* v 15 n 6 Jun 1988 p 35-39.

**087484 REVIEW OF BLAST DESIGN CONSIDERATIONS IN QUARRYING AND OPENCAST MINING PART 2 INITIATION AND COMPUTERIZED DESIGN.** With the development of modern drilling equipment capable of drilling blast-holes cleanly and accurately and advanced surveying equipment for the precise determination of quarry face profiles, blasting design is simpler and more predictable. The use of computers may also predict blast results and permits adjustments to blast patterns and choice of explosives

without recourse to implementing these in the field. In spite of these modern aids to blast design, safe blasts need not necessarily follow accurate measurement and computer-aided design. It is a combination of these factors with understanding on the part of the operator which will ultimately lead to safe and efficient blasts. The computer aided design method SABREX is described.

Ball, Malcolm (Nobel's Explosives Co). *Quarry Manage* v 15 n 7 Jul 1988 3p.

## California

**087485 HIGH-GRADE AGGREGATES FROM NEW CALIFORNIAN QUARRY. TWO-MILE CONVEYOR SYSTEM GENERATES POWER.** Capable of producing 8,000 tons a day of high-grade aggregates for railway ballast, road base and other construction applications, a new quarry located in an environmentally sensitive area near Newberry Springs, California, was opened in February 1987. Owned by McKee Products Inc., the plant produces - 2in ballast from a solid andesite formation for the Santa Fe Railway Co. and a portion of its output is sold to the area construction industry. Railway ballast is processed at the quarry and delivered to a railway siding two miles away by a haul conveyor system.

Anon. *Quarry Manage* v 15 n 1 Jan 1988 31-32, 34.

## Computer Applications

**087486 MANAGEMENT INFORMATION SYSTEMS IN QUARRYING: MEETING THE QUARRY OWNER'S NEEDS.** This paper explores present-day management needs and expectations in relation to the types of information services now available. It attempts to draw together all the information needs of a quarry owner, suggests how the most up-to-date information systems can help handle this data, and explains how a management structure may be modified. The aspects of a quarry operation which can be assisted by an information system are identified and discussed.

Fuchs, Peter (Steeley Quarry Products Ltd). *Quarry Manage* v 14 n 10 Oct 1987 p 19-20, 23.

**087487 COMPUTER AID IN QUARRY DESIGN AND PLANNING.** Computer systems which assist management and engineers in the design and operation of quarries have been available for a number of years. This paper is concerned with aspects of these systems and their potential for improving the efficiency of quarry operations. A brief description of current mining computer-aided design (CAD) features is provided and the benefits of employing such systems are discussed. The introduction of these systems has been slow in the UK with most quarrying operations still carrying out designs on a manual basis. The reasons for this reluctance to adopt what is basically proven technology are examined. 17 refs.

Denby, Bryan (Univ of Nottingham, Engl). *Quarry Manage* v 15 n 5 May 1988 10p.

## Control Systems

**087488 NEW TECHNOLOGY INCREASES PRODUCTION AT MACHEN.** A recent installation on behalf of ARC Powell Duffryn at Machen Quarry in South Wales confirms that the introduction of new technology can significantly improve productivity and the efficiency of plant operation and also be totally accepted by the existing work force. This particular installation uses a suite of Gem-80 programmable controllers configured as a distributed control system which is distributed into distinct control areas: primary crushing, final bin blending control, secondary crushing control, tertiary crushing control, and rail loading control. Other information integrated into the overall control system is detailed plant status information relayed to the manager's office for display of a VDU terminal, and control of plant load shedding from information derived from maximum demand equipment sited in the primary substation.

Graves, G. (Advanced Control Systems Ltd of Leeds, Engl). *Quarry Manage* v 14 n 9 Sep 1987 p 37, 39.

## Alabama

**087475 HOOVER OPENS LIMESTONE QUARRY AT HUNTSVILLE.** Hoover Inc., a multi-plant aggregate producer headquartered in Laverne, Tenn., recently opened a 1.2 million t/y capacity limestone processing facility in Huntsville, Ala. The plant was designed to be efficient, yet simple to operate while producing a wide range of materials needed by the local market. The plant's crushers are described.

Michard, Don. *Pit Quarry* v 80 n 9 Mar 1988 p 46-49.

## Austria

**087476 WANDABBAU MIT STROSSENARTIGEM VERHIEB - ERFABRUNGEN DER STEIRISCHEN MONTANWERKE AG.** [Benched Highwall Mining - Experience of Steirische Montanwerke AG]. Steirische Montanwerke AG operate three quarries in Austria (at Leoben, Peggan and Bad Ischl) by benched highwall mining. Material is pushed down the benches to the main level, where the breaker is installed. The advantages and disadvantages of pushing down the material from the benches in comparison to truck haulage are discussed. In German.

Reska, Peter (Steirische Montanwerke AG, Leoben, Austria). *Berg Huetttenmaenn Monatsh* v 133 n 4 1988 p 181-183.

## Automation See CRUSHERS—Reviews.

## Blasting

**087477 BLAST VIBRATION PROBLEMS.** Quarries located close to communities often produce conflict based on environmental impact. One principal cause of such community relations problems is blasting. A blast delay sequence design based on frequency response spectra can help stem neighbor complaints.

Petro, Anthony J. (Vibra-Tech Engineers Inc); Anderson, Douglas A. *Pit Quarry* v 80 n 3 Sep 1987 p 32-34.

**087478 BLASTING WITH PRECISION.** Florida Rock Industries' quarry at Forest Park, Ga. is located on the southern edge of Atlanta a few miles from the Hartsfield International Airport. Florida Rock contracted with Vibra-Tech Engineers to prepare a Vibra-Map analysis of the quarry. The analysis defined specific delay intervals to be used between blast hole rows and between each hole in a row in order to minimize vibration at neighboring businesses and apartments.

Drake, Bob (Pit & Quarry, Chicago, IL, USA). *Pit Quarry* v 80 n 3 Sep 1987 p 36-37.

**087479 BULK EMULSION USE LOWERS DRIL-**

**087489 FLS - COMBIOLOGIC FOR INTEGRATED CONTROL OF QUARRY, RAW MEAL AND CLINKER PRODUCTION.** The CombiLogic has been developed and used by F.L. Smith (FLS) over recent years in connection with consultancy jobs and when creating plant layout and designs. Based on the available raw materials and oil or coal quality, CombiLogic is a valuable tool to ensure that the most economical plant design can be determined. Existing plants can benefit from the system by simulating how the remaining and sometimes misused quarry can be utilized in the most economical way. CombiLogic is a modern tool to assist in solving problems with difficult raw materials or, in some cases, to extend the lifetime of quarries by carrying out the necessary number of production simulations. On the environmental side it is possible to determine by simulation how the quarry landscape will look in the future by using the system's extensive array of excellent three-dimensional graphic facilities.

Anon. *World Cem* v 19 n 4 Apr 1988 p 123-124.

## Conveying

**087490 CONVEYING IN OPEN PITS.** The advantages of conveyor transport in surface mines and quarries, including economy, reliability and quietness of operation, are well known. Despite these advantages many operators are still concerned about the potential difficulties in maintaining conveyors close to a working face, being unaware of some of the more recent developments in this sector where Dowty Meco are regarded as one of the UK's leading manufacturers. The new developments are briefly reviewed.

Anon. *Mine Quarry* v 17 n 3 Mar 1988 p 19-20.

## Crushing and Grinding See Also CRUSHERS—Modification; SLATE.

**087491 WORLD'S LARGEST MOBILE CRUSHER IN TEXAS: REDLAND WORTH'S AUTOMATED PLANT AT SAN ANTONIO.** The author reports on a recent visit to Redland Worth's operations at San Antonio, Texas, to see the world's largest mobile primary crusher and their new, highly automated processing plant. The Redland Worth crusher is thought to be unique in that it is equipped with a pre-screening facility designed to their own specification, whereby the 4-in (100mm stone) is taken out of the feed ahead of the crusher at a rate of 2,500 tonnes/h and sent on a bypass chute to the crusher product conveyor, providing a bed of material on the belt to alleviate shock loading. The crusher will accept boulders up to 45ft maximum dimension and gives a product which is set 85% under 4in, with the largest stone being 6-8in.

Hill, Bernard (Quarry Management, Nottingham, Engl). *Quarry Manage* v 15 n 3 Mar 1988 p 9-16.

**087492 HYDRAULIC ROCK BREAKERS.** The problem of dealing with oversize boulders in the feed to the crusher is one which confronts almost every quarry crushing operation. By the use of a hydraulic boom system mounting an impact hammer the secondary breaking operation can be safely brought inside the crusher house. A hydraulic boom system is basically a stationary-mounted, slewing, articulated boom used to position a hydraulic hammer for the purpose of breaking oversize rocks in a feeder or crusher. The boom system consists of a pedestal bolted to either a concrete or a steel foundation. The hydraulic power is supplied by a self-contained power-pack.

Donahue, Bryan D. (Rammer Oy, Finl). *Quarry Manage* v 15 n 2 Feb 1988 p 15, 17, 19.

**087493 CONCEPT OF PRIMARY ROCK SIZING.** The twin-roll machine developed by MMD Mineral Sizing for primary rock reduction is referred to as a 'sizer' because it passes any material which does not require breaking. The size of the broken material can be controlled in all three planes, giving an accurately sized product. The tooth configuration acts like a rotating screen, allowing

undersize material to flow through with the minimum of energy usage. Material to be broken is then presented to the teeth in such a manner that the weakness of rock in tension is exploited to the best advantage, providing low kW per tonne figures. The article describes some recent applications in the UK and some other countries.

Flynn, Brian (MMD Mineral Sizing Ltd). *Quarry Manage* v 15 n 7 Jul 1988 p 29, 31.

## Drainage

**087494 ORIGIN OF NITROGEN COMPOUNDS IN WATER INFILTRATING INTO PORPHYRY QUARRY, ZALAS, SOUTHERN POLAND.** The paper deals with the problem of the origin of nitric compounds in the mine water entering porphyry quarry. A hydrogeological study of the natural and disturbed ground water regimes as a consequence of quarrying have shown that fecal and domestic sewage was the main source of nitrogen compounds in the water entering the porphyry quarry. The sewage contaminated the surface water which in turn infiltrated into the porphyry within the cone of depression. In addition to that,  $\text{NH}_4^+$  and  $\text{NO}_3^-$  ions penetrated into the surface water as the result of washing of nitrogen out of the soil and as a product of biochemical and chemical changes in the soil. A solution of unburnt explosives, used for the ground excavation was also a source of nitrogen compounds. (Author abstract) 6 refs.

Adamczyk, A.F. (Acad of Mines & Metallurgy, Cracow, Pol); Lesniak, T.C.; Motyka, J. *Int J Mine Water* v 6 n 2 Jun 1987 p 27-36.

## Dust Abatement

**087495 REDUCTION OF THE EFFECT OF BLASTING ON THE ATMOSPHERIC DUST CONTENT IN QUARRIES AND THE ENVIRONMENT.** Blasting in quarries is a very intense source of periodic dust release. Depending on the amount of simultaneously exploded charge and the size of the block, the amount of dust released into the quarry atmosphere may reach hundreds and thousands of kilograms. Dust released during breaking of rocks is partly carried by air currents from the quarry, although a significant part of it settles on various surfaces and it serves as a source of secondary dust formation which enters the air again. Therefore, in developing methods and ways of reducing entry of dust into the atmosphere from massive explosions during open-cast mining, it is necessary to consider measures preventing dust from flying up from the neighboring territory. Dust concentration in the dust-gas cloud at selected points was measured remotely by means of portable rotary blowers PRV-1M form special concrete bunkers. Simultaneously, wind velocity and direction; air temperature and moisture content in the exploded block and at the quarry surface were measured. 3 refs.

Bitkolov, N.Z. (Scientific-Research Inst of Water Transport Hygiene, Leningrad, USSR); Ivanov, I.I.; Pichuev, V.I. *Sov Min Sci* v 23 n 1 Jan-Feb 1987 p 44-50.

**087496 ROCK DUST CIRCUMSTANCES IN STONE QUARRYING AND PROCESSING PLANT.** Focusing on the large scale and the highly mechanized granite stone industries, the present state of dust circumstances in the quarry and the processing plant, the present state of dustproofing measures and the direction of their improvement are discussed. The principal items are as follows; Present state of stone industries; Results of dust survey; Valuation of the state of dust in the working environment; Present state of the dustproofing measures; and Direction of their improvement. (Edited author abstract).

Energy Resources See ROCK—Energy Resources.

## England

**087497 REDEVELOPMENT AT WHATLEY.** Following a £25 million redevelopment programme, Whatley quarry, one of the largest, most modern and efficient limestone quarries in Europe, has a potential production capacity of 10 million tonnes a year. The quarry supplies crushed rock for use throughout Southern England. Much of the extra output is destined for the South East where there is a need to replace diminishing local deposits of sand and gravel. The investment in new plant and equipment and improvements to the rail link mean that Whatley is set to meet the demand for aggregates well into the next century.

Anon. *Mine Quarry* v 17 n 1-2 Jan-Feb 1988 p 11-12, 13-15.

**087498 WHATLEY QUARRY, ENGLAND.** Whatley quarry, situated four miles west of Frome, Somerset, England, is one of the largest and most efficient limestone quarries in Europe. Operated by ARC, a UK producer of construction materials, it supplies crushed rock by both road and rail throughout much of southern England. Coated roadstone and precast concrete are also delivered locally by road. With the recent completion of a three-year redevelopment program the quarry now has a potential production capacity of up to 10 Mt/y. The article describes operations.

Anon. *Min Mag* v 158 n 6 Jun 1988 p 466-471.

**087499 NATURAL DIAMOND—A PAWSON TRADITION.** Woodkirk Brown York Stone has been quarried and worked in and around Morley, West Yorkshire, for nearly a century and a half. Today, fine grained sandstone blocks from Britannia Quarry are frame sawn using De Beers EMB natural diamond. The purpose-built factory has a production capacity in excess of 500 tons of block throughput per week. The article describes the sawing operations. 1 Ref.

Daniel, Paul. *Ind Diamond Rev* v 48 n 525 Feb 1988 p 44-46.

**087500 WHERE PRINCE BISHOPS ONCE RULED.** Dunhouse Quarry Co Ltd was established around 1926. From block extraction the Dunhouse Quarry Company turned its attention to the provision of primary and secondary sawing, polishing and masonry facilities on site. The article describes the diamond sawing equipment.

Anon. *Ind Diamond Rev* v 48 n 525 Feb 1988 p 53-55.

## Environmental Impact

**087501 ENVIRONMENTAL IMPACT OF QUARRYING.** The environmental programmes needed to ameliorate the impacts of quarrying have an inevitable cost to the operator. Just as inevitably, however, there are costs (to the operator, the broader community and the environment) of not implementing such programmes. The ultimate cost to the operator of non-implementation could be withdrawal of continued approval for the operation. It has to be recognized that the broader community will no longer accept environmentally inadequate activities and that effective environmental programmes are now regarded as a necessary part of quarrying operations. Implementation of these programmes as an ongoing part of the quarrying operation is the most effective and efficient way of achieving the desired outcome.

Holmes, P.J. (Environmental Protection Authority of Western Australia). *Quarry Manage* v 15 n 4 Apr 1988 p 37-40, 43.

Equipment See Also LIMESTONE—Chemical Analysis; PROTECTIVE COATINGS—Wear; SAND AND GRAVEL PLANTS—Equipment.

**087502 SELECTING THE RIGHT MACHINE FOR THE JOB.** Selecting the right type of equipment to load material depends on many factors. Some considerations are the application, site layout and set up, company history, and availability of required back up. For the quarry with production needs between 300 and 1,800 t/h, the hydraulic excavator - shovel or backhoe - is gaining more consideration by management.

Rokahr, Dietrich F. (Liebherr-America Inc). *Pit Quarry* v 80 n 5 Nov 1987 p 44, 46-47.

**087503 SAND PROCESSING, PRODUCT OPTIMIZATION AND WASTE TREATMENT - PART 3. CLASSIFICATION (CONTINUED).** Hindered-settling classifiers (hereafter referred to as HSCs) have a long history in mineral processing. The HSC has not been described previously in any Institute of Quarrying publication. A discussion of the machine is broken down below into four sections, as follows: principle of operation; mechanical construction and design parameters; classification efficiency - overflow and underflow products, and use of several HSCs in achieving multi-product classifications. The use of the HSC in de-sliming/dewatering, removal of heavy minerals and removal of lignite are also briefly discussed.

Littler, A. (ARC Southern Ltd). *Quarry Manage* v 114 n 11 Nov 1987 p 41-42, 45-48.

**087504 CENTRAL MAINTENANCE FACILITY SAVES MONEY.** With a central maintenance facility adjacent to company headquarters in LaVergne, Tenn., Hoover Inc. saves money on the upkeep and upgrading of equipment at its five quarry sites. One way the facility saves money is by enabling the company to buy parts and materials in bulk, distributing materials to each site as needed. Parts are stored and an inventory record is kept. Another way the company saves money is by performing most of its own maintenance.

Constantino, Darren. *Pit Quarry* v 80 n 1 Jul 1988 p 36-38.

**087505 JOEST SCREENING MACHINES FOR QUARRYING.** Modern screening technology must meet very demanding DIN and efficiency assurance standards. In many cases, conventional screening machines can no longer cope with those requirements. Unusual shaped fractions cause pegging of the screen deck, resulting in reduced screening efficiency and throughput. The Joest vibrating screens type SWZ (double-deck) and type SWD (triple-deck) have been developed to meet these demands. The screen body ties the screen deck and unbalance shaft drive together. For ease of maintenance of the screen decks there is sufficient space provided between the deck and body. 2 Refs.

Zuber, J. (Joest GmbH, Muenster, East Ger). *Bulk Solid Handl* v 8 n 3 Jun 1988 P362.

## Explosions

**087506 CHANGES IN THE CONCENTRATION OF DUST RELEASED DURING A MASSIVE QUARRY EXPLOSION.** With the intensification of mining processes the amount of simultaneously detonated explosives reaches 1000-1300 tons at individual open-pit iron mines. The dust-gas cloud formed during the explosion is polluting the atmosphere of not only the mines but also the regions adjacent to them. A quantitative estimation of the dust concentration in the dust-gas cloud is presented for determining the effect of harmful emissions of a quarry during massive explosions on pollution of the atmosphere and the earth's surface in areas adjacent to the quarry and for identifying sanitary-protective zones. 13 refs.

Beresnevich, P.V. (All-Union Scientific-Research Inst of Mining Safety, Krivoi Rog, USSR); Den'gub, V.I.; Nalivaiko, V.G. *Sov Min Sci* v 23 n 2 Mar-Apr 1987 p 178-181.

Federal Republic of Germany See Also LIME-STONE—Processing.

**087507 WEST GERMANY'S SECOND LARGEST LIMESTONE QUARRY.** Germany's second largest limestone quarry is located along with many others in the area around Menden and Balve, where the valuable raw materials to be found there are quarried and processed for various industrial applications. Rheinisch-Westfälische Kalkwerke AG (RWK) extract some 3.8 million tonnes per year, and their Hoennetal works, which has now been working for exactly 90 years, still has reserves in its Asbeck, Horst and Eisborn fields sufficient to extend the life of the quarry for another 30 years and more. Rheinische-Westfälische Kalkwerke AG, with their main offices in Wuppertal-Dornap, have four works employing over 1,000 people, and a yearly turnover of around DM250 million. Some topics discussed are the historical background, quarrying operations, the processing plant, markets, and environmental measures.

Anon. *Quarry Manage* v 15 n 4 Apr 1988 p 49-50.

## Florida

**087508 SUCCESSFUL QUARRY START-UP IN AN AGGRESSIVE MARKET.** When White Rock Quarries began its new operation, start-up costs, operating efficiencies and product quality were given extensive consideration. White Rock quarries contracted with Explosives Technologies International (ETI), the new company formed from the U.S. and Canadian explosives businesses of DuPont Co. to perform all drilling and blasting. ETI obtained necessary permits and insurance, conducted seismic tests and developed a blasting program based upon White Rock's long range plans for quarry development.

## Georgia

**087510 TWO FLORIDA ROCK QUARRIES ADD HYDRAULIC EXCAVATORS.** Florida Rock Industries Inc. has upgraded the crushing capacity of its Forest Park Quarry and Tyrone Quarry in Riverdale, Ga. The hydraulic excavators reduce tire, maintenance, and production costs. The quarry operations are described.

Adams, Bruce. *Pit Quarry* v 80 n 5 Nov 1987 p 30, 32, 34.

Illinois See Also SAND AND GRAVEL PLANTS—Illinois.

**087511 TUNNEL PROVIDES ACCESS TO 35 YEARS OF RESERVES.** At its Romeo Quarry near Chicago, Material Service Corp. completed an 1,800-ft tunnel crossing underneath the Des Plaines River. The tunnel provides access to 35 years of aggregate reserves on the river's western side, while the eastern reserves are nearly depleted. Using in-house personnel, Material Service constructed the tunnel for approximately 80 percent less than the price quoted by underground contractors.

Drake, Bob; Constantino, Darren. *Pit Quarry* v 81 n 3 Sep 1988 p32,34-35.

## Land Reclamation

**087512 PLANNING SCHEMES FOR RECLUTIVATING THE CENTRAL ZONES OF WATER WASTES IN QUARRIES AT THE SEMILUKS REFRACORIES FACTORY.** The necessary condition for reactivating water dumps is the possibility of free movement of wheel and caterpillar transport over the surface of panned earth. Fulfilling this condition is possible for certain strength factors in weak, water-saturated clay soils of the central zones of the water dumps. Of the numerous artificial strengthening methods the simplest is the method of installing supporting sand cushions. Using an example, the authors examined the problem of determining the optimum thickness of the sand supporting cushion. 7 refs.

Chernyaev, V.F. (Voronezh State Univ, USSR); Litvinova, V.M.; Muzylev, N.A. *Refractories* v 28 n 1-2 Jan-Feb 1987 p 34-39.

**087513 USING EXPLOSIVES IN RECLAMATION.** The cost of reclamation has become an important factor in quarry economics. As a result, operators are seeking to compare differences in reclamation costs when they have the option to choose one of the four basic methods of reclamation. This article describes the four methods which are backhaul and fill; highwall blasting; combined backfill and blasting; and simultaneous stripping, reclamation and production.

Postupack, Conny (Atlas Powder Co). *Pit Quarry* v 81 n 3 Sep 1988 p 28-30.

## Loaders

**087514 ENHANCED LOADER OFFERINGS COMPLICATE SELECTION PROCESS.** A guide to choosing the right wheel loader for pit and quarry applications is specified. When in the market for a wheel loader, the buyer should first identify specific needs by asking the following questions. What materials will be handled? What weight? What are travel distances? Will the machine be stockpiling or feeding a crusher? Will the machine have to negotiate grades or deal with soft underfoot conditions? What is desired production? Is production limited by crusher capacity or other job site factors? What is the required machine payload and cycle time? What other tasks might be required of the loader? What job site conditions might change? Increased volume? Physical expansion? Future requirements?

McBeth, D.F. (Caterpillar Inc, Peoria, IL, USA). *Pit Quarry* v 80 n 12 Jun 1988 p 26-29.

**087515 LOADERS FOR THE LONG HAUL.** Sand and gravel operations are perhaps best suited to changing to load and carry applications because material can usually be fed onto conveyors without the use of a primary crusher. Given an adequately sized conveyor and processing plant, limiting factors on production in such an operation become the distance from the hopper to the working face and loader speed. At any given distance between load and dump points, the relationship of loader (bucket) size and loader speed will determine actual production. A quicker, smaller loader may actually be more productive - not to mention less expensive to purchase and operate - than a larger machine.

Drake, Bob. *Pit Quarry* v 80 n 12 Jun 1988 p 36-38.

**087516 ARKANSAS QUARRY CUTS COSTS WITH SMALLER LOADER.** The Arkhola Sand & Gravel Co.'s Preston quarry operation has cut costs - without reducing productivity - by replacing its existing loader, which incorporated an 11-cu-yd bucket, with a smaller model. Located just outside Van Buren, Ark., the operation now utilizes a Kawasaki 110Z with a 7-cu-yd bucket as its primary loader. According to John Sulcer, Arkhola vice president, the older machine did a good job, but it was larger than needed. When time came for a replacement, a smaller loader was considered. 'By going to

the smaller, Kawasaki loader,' Sulcer says, 'we saved money on its initial cost without sacrificing productivity.' And, as a bonus, Sulcer says, 'we have a faster, more maneuverable loader.' The plant's capacity averages between 2,500 to 3,000 st/d with peak production at about 5,000 st/d. The new loader has been in operation for approximately 10 months, and Sulcer says there have been no major problems with it. He also reports significant savings in fuel costs, owing to its smaller rate per hour consumption than the 12-cylinder engine in the older machine.

McKain. *Pit Quarry* v 80 n 12 Jun 1988 p 41-42.

## Management

**087517 COMPETENCE ASSESSMENT AS AN AID TO MANAGEMENT IN QUARRYING. GRADERS, DOZERS AND TRACTOR SCRAPERS IN QUARRYING APPLICATIONS.** Members of management are required to contribute towards their achievement of company profitability by ensuring that their employees are properly qualified and organized to carry out their jobs. 'Properly qualified' implies skill, knowledge and understanding and also experience, or should the word be 'competence' to apply the skill and knowledge in a safe and efficient manner and to the standards required? There are various constraints, protective devices and protective systems which influence the requirement for safe and efficient operation. Protective systems include: Mines and Quarries Act 1956; Regulations made under this Act; Health and Safety at Work etc. Act 1974; and Codes of Practice.

Wilkinson, George (Quarry Products Training Council). *Quarry Manage* v 14 n 9 Sep 1987 p 23-26.

**Maryland** See CRUSHED STONE PLANTS—Automation.

## Minnesota

**087518 HYDRAULIC EXCAVATOR MEETS GRANITE QUARRY CHALLENGE.** When operators of the St. Cloud, Minn. quarry, owned by Meridian Aggregates, increased the plant's capacity by 50 percent it became apparent that their eight-cu-yd rope shovel was not capable of maintaining the required production rate. After considering several options, management elected to buy a hydraulic excavator for face loading. Its advantages are improved mobility, lower operating cost and ability to match the increased production capacity of the processing system.

Michard, Don. *Pit Quarry* v 80 n 5 Nov 1987 p 49-50.

## New Zealand

**087519 EXTRACTION OF NARROW-SEAMED LIMESTONE DEPOSITS EXPERIENCE OF QUARRYING IN NEW ZEALAND'S POVERTY BAY AREA.** This paper considers the quarrying of road metal from highly disturbed and contorted limestone seams which exist at a limited number of sites within the Poverty Bay area of New Zealand's North Island. The material type and the geological deposits in the area differ from the massive blocks which are prevalent in the Te Kuiti area. While the basic quarrying principles are the same for both areas, the extraction techniques vary. In the Poverty Bay area a philosophy of winning every piece of stone must be adhered to in order to ensure the viability of the operation, whereas in the Te Kuiti situation the massive deposit lends itself to mass production and the by-passing of isolated or difficult outcrops.

Pulman, Stan (Cook County Council, NZ). *Quarry Manage* v 15 n 7 Jul 1988 p 19-22.

## Noise Abatement

**087520 CONSTAT, REDUCTION ET PREVISION DU BRUIT AUTOUR DES INSTALLATIONS**

**D'ELABORATION DES GRANULATS ET DES CARRIERES.** [Observation, Reduction and Prediction of Noise in the Vicinity of Aggregate Preparation Installations and Quarries]. This report deals with the study of noise in the vicinity of quarries and aggregate preparation installations. It covers an observation of noise levels produced by the equipment itself, and the results obtained in the vicinity of various sites; a description of ways and means of reducing noise, together with methods of successfully implementing a noise reduction programme; and a description of a method of predicting noise in the vicinity of installations, accompanied by examples of its application revealing the accuracy of the results obtained. In addition, acoustic elements, measurement methodology, and phenomena of propagation are described. (Edited author abstract) 146 refs.

## Open Pit

**087521 SUCCESSIVE INCREMENTS IN PIT DEPTH AS A FUNCTION OF THE DEGREE OF RATIONAL USE OF ENCLOSING ROCK.** An algorithm and programs have been developed for the estimation of the relative depth increment of open-pit working as a function of the degree of rational use of the enclosing rock in the initial quarry contours and beyond these limits. The model developed can be implemented on a computer. With a degree of rational use of the enclosing rock that is no greater than 25-30%, the exploitation of secondary minerals beyond the contours of the quarry has no significant influence on the increment in depth. The rational use of some of the enclosing rock at ore deposits permits complete working by the open-pit method, and thus yields an additional profit due to the reduction in loss of basic raw materials in the ground, the utilization of secondary production, and savings in the means for mine reconstruction. 1 ref.

Peshkova, M.Kh. *Sov Min Sci* v 23 n 3 May-Jun 1987 p 238-242.

## Philippines

**087522 MARBLECRAFT - 27 YEARS IN BUSINESS.** Marblecraft Inc. is one of the Philippines' longest established marble tile producers. The company buys in white, grey and pinkish red blocks to supplement production from its own quarry. The United States currently takes about 80% of finished tiles, whilst Australia and Japan are becoming important markets. Diamond machining methods at the processing plant are described.

Hayes, David. *Ind Diamond Rev* v 48 n 525 Feb 1988 p 51-52.

**Screening** See SCREENS AND SIEVES—Plastics Applications.

## South Carolina

**087523 MAKING THE BEST ROCK FROM AVAILABLE SOURCES.** The construction of earthfill dams for a pumped storage reservoir in Oconee County, S.C., is presenting production challenges for an on-site quarry. The reservoir - a portion of Duke Power Co.'s Bad Creek Hydroelectric Station project - will be part of a pumped storage system for generating electricity. Near the center of what will be the reservoir is the quarry. Dams are being built using the crushed stone.

Drake, Bob; Kuhar, Mark S. *Pit Quarry* v 81 n 3 Sep 1988 p 40-41.

**Texas** See CRUSHED STONE PLANTS—Automation.

## United Kingdom

**087524 AGGREGATE PROCESSING PLANT - THE WAY AHEAD: A REVIEW OF TRENDS IN CRUSHING AND ASSOCIATED EQUIPMENT.** The paper deals with the quarrying scene as it is today and as

foreseen for the years ahead. The author reviews current and future design concepts for plant and machinery under three specific headings which cover the majority of present and future plant work: mammoth quarries, conventional fixed-type plant and unitized plant. Essentially the paper relates to events in the UK market, but much of what is said has relevance to quarrying in Western Europe.

Massey, Joe (Pegson Ltd). *Quarry Manage* v 14 n 10 Oct 1987 p 27-28, 31-32, 35-36.

**087525 WHERE DO WE GO FROM HERE?** The UK South East Economic Planning Region generates approximately one-third of the demand for aggregates in England, amounting to some 55 million tons a year. Demand forecasts are that this tonnage will rise to 75 million tons by the turn of the century. The area contains virtually no rock and planning constraints on sand and gravel continue to increase in severity. This article is an analysis of future alternatives for the development of large quarry operations based on Redland Aggregates' experience at Mountsorrel.

Phillipson, George (Redland Aggregates Ltd). *Quarry Manage* v 15 n 5 May 1988 p 43-46.

## Wales

**087526 PENRHYN QUARRY.** Penrhyn slates are recognized worldwide for their high quality and durability in roofing applications. For over 200 years they have been produced at Penrhyn Quarry situated on the Cambrian slate belt of North Wales, and throughout this time the actual splitting of the quarried slate has changed little. Elsewhere in the operation, Penrhyn is keeping pace with modern quarrying methods and has had a major quarry modernization scheme with the accompanying investment in modern quarry plant.

Anon. *Mine Quarry* v 16 n 9 Sep 1987 p 9-12.

## Waste Disposal

**087527 CHINA CLAY TECHNOLOGY REDUCES WASTE.** At ECC's Moorcroft Quarry, the limestone formation contains clay within the fractured uppermost 15m of the deposit. An estimated 250,000 tonnes of heavily contaminated broken limestone was too dirty to be processed in the washing plant. An innovative system was employed to wash the contaminated limestone which used a 4in monitor and a centrifugal pump. The monitor can deliver 800-900 gal/min at 200 lb/in<sup>2</sup> into the dirtpile. Some 50-60 tonnes/h can be adequately washed.

Anon. *Quarry Manage* v 15 n 4 Apr 1988 4p between p 11 and 18.

**087528 EFFECT OF ION ABSORPTION OF SOME METALS ON CYTOTOXICITY AND FIBROGENICITY OF QUARTZ DUST.** The comparative and experimental study was designed to investigate cytotoxicity and fibrogenicity of initial quartz dust and dust with absorbed cations (Ca<sup>2+</sup>, Zn<sup>2+</sup>, and Al<sup>3+</sup>). It was demonstrated that silica cytotoxicity and fibrogenicity are actively inhibited to force out mobile hydrogen. Due to the obtained results we can evaluate chemical affinity of some metal ions for silica as an antislucosis means. The presence of a significant number

of such metal ions provides the opportunity of receiving an effective antistatocilicosis means. (Author abstract) In Russian. 11 refs.

**087529 THERMOLUMINESCENCE (TSL) RELATED WITH THE  $[\text{SiO}_4/\text{Na}]$  CENTER IN QUARTZ.** A double excitation procedure performed on Na-swept quartz resulted in the appearance of an extremely strong TSL peak in the glow curve near 200 K. The formation and other characteristics of this sodium TSL peak were found to be fully analogous to those of the previously observed lithium associated TSL peak near 190 K. The sodium peak near 200 K should therefore be associated with the  $[\text{SiO}_4/\text{Na}]$  center. The sodium-swept samples also exhibit a very strong phosphorescence at 20 K which decays steeply on warming to 25 K. It was found to be related to the center responsible for the TSL peak near 200 K. (Author abstract) 5 refs.

**087530 OBTAINING UNFIRED QUARTZ CERAMICS BY IMPREGNATING IN ETHYL SILICATES.** In the proposed method of obtaining unfired quartz ceramic, the contact area and the forces of interaction between the particles are increased by impregnating the unfired preforms with pure unhydrolyzed ethyl silicate or tetraethoxysilane immediately followed by their simultaneous hydrolysis and gelation within the product. In subsequent studies, treating in ammonia solution was replaced by hot water treatment. In this case, the temperature of water acts as a catalyst for hydrolysis and gelation of ethyl silicate instead of ammonia. When treating with water in the 80-100°C range, the maximum strength is obtained within 2 h. The strength remains unaltered during subsequent holding. 10 refs.

## Acoustic Properties

**087531 SURFACE ACOUSTIC ATTENUATION IN QUARTZ.** The authors set themselves the task of measuring the phonon viscosity tensor components in samples of synthetic quartz and of constructing the attenuation surfaces in these crystals. They used samples of  $5 \times 5 \times 20$  mm for the measurements. The long side of the samples, along which the acoustic waves travelled, was oriented along the second and third order symmetry axes and also (100) plane (so-called BC and AC cuts). The attenuation was measured by an acoustooptic method at a frequency of 450 MHz. 7 refs.

## Analysis

**087532 PETROGRAPHIC CORRELATIONS AND ANALYSIS OF FLUID INCLUSIONS IN HYDROTHERMAL QUARTZ CRYSTALS FROM FOUR WELLS IN THE MOMOTOMBO GEOTHERMAL FIELD, NICARAGUA.** Four wells of the geothermal field of Momotombo (Nicaragua) have been studied. Their primary and hydrothermal petrology have been described and correlations established. They are composed of andesites and tuffs. The description of the hydrothermal paragenesis allows us to conclude that the geothermal conditions are situated at the limit of the albite-zeolite and greenschist facies. In three of them, hydrothermal quartz crystals have been picked over and microthermometric measurements on their fluid inclusions gave homogenization temperatures ranging from 160 to 275°C. The fluid is assumed to be pure water of meteoric origin; boiling did not occur. But in MT 37 well there could be up to 0.83 moles % of  $\text{CO}_2$ , which would place the histograms in the vapor region of the curve. Gaseous inclusions were

analyzed, giving a mixture of  $\text{CO}_2$ ,  $\text{CH}_4$ ,  $\text{N}_2$ . (Author abstract) 29 refs.

## Cleaning

**087533 QUARTZWARE CLEANING TECHNOLOGY.** Modular Quartzware Cleaners now provide complete removal of all organic and inorganic contamination without consuming clean room space or taking quartz items out of the clean room. Semiconductor quartzware must be totally cleaned of surface contaminations, both organic and elemental. Quartzware types include tubes, paddles, cantilevers, pull rods, water boats, thermocouple sheaths, bell jars, and epitaxial reactor jars. Two different types of cleaning processes are commonly done, using a variety of agents and equipment. Both processes can now be performed automatically in the Poly-Flow system.

Anon. *Solid State Technol* v 31 n 1 Jan 1988 p 79-80.

## Cooling

**087534 THEORETICAL AND EXPERIMENTAL STUDY OF RADIATIVE-CONVECTIVE HEAT TRANSFER DURING THE COOLING OF QUARTZ GLASS.** The cooling of quartz glasses in a vacuum is studied on the basis of numerical solution of a problem of radiative-conductive heat transfer which considers the temperature and spectral dependences of the optical and thermophysical parameters. An experimental study is made of the surface temperature of different quartz glasses during cooling. It is shown that the concentration of hydroxyl groups present in the glass has an effect on the temperature field. (Author abstract) 8 refs.

Galaktionov, A.V. (Acad of Sciences of the USSR, USSR); Mukhamed'yarov, K.S.; Petrov, V.A.; Stepanov, S.V. *High Temp* v 25 n 2 Mar-Apr 1987 p 250-255.

## Crystal Lattices

**087535 LATTICE DYNAMICS OF CRISTOBALITE.** Dispersion relations are calculated in a number of symmetry directions for  $\alpha$ -cristobalite, using three force constants describing bond stretching, and bond bending at both silicon and oxygen atoms. A Keating representation is used for the first two, but for stability a Born potential was used to describe bending at the oxygen atom. The calculation shows that very-low-frequency zone-boundary transverse acoustic modes arise naturally in the perfect crystal, giving a density of states at low frequencies that explains the low-temperature heat capacity. (Author abstract) 18 refs.

**Defects** See Also CRYSTALS—Dislocations; OPTICAL MATERIALS—Quartz Applications; OXIDES—Spectroscopic Analysis.

**087536 PERFECTION OF QUARTZ AND ITS CONNECTION TO CRYSTAL GROWTH.** The perfection of cultured quartz and its connection to growth processes is reviewed. The principal macroscopic imperfection, 'creative flawing', is shown to be the hydrothermal crystal growth analog of dendritic growth and can be eliminated by the proper choice of growth direction and manipulation of conditions to minimize the effects of diffusion. Acoustic loss (1/Q) is proportional to the infrared absorption at the OH stretch frequency and is most likely due to a small (a few hundred molecules)

number of aggregates of  $\text{H}_2\text{O}$ , although lesser quantities of OH, which charge-compensate  $\text{Al}^{3+}$  and  $\text{Fe}^{3+}$  at  $\text{Si}^{4+}$  sites, are also present. Techniques for preparing cultured quartz with Q equivalent to the best natural quartz are now routine. Radiation hardness is discussed in terms of impurity content. Impurity-decorated dislocations are shown to be the most probable cause of latent etch channels. Dislocations propagate from the seed but may be initiated by particulate inclusions and/or lattice parameter mismatch between the growth and the seed. Dislocation-free material can be grown by seed selection and procedures that eliminate inclusions. 80 refs.

Laudise, Robert A. (AT&T, Murray Hill, NJ, USA); Barnes, Robert L. *IEEE Trans Ultrason Ferroelectr Freq Control* v 35 n 3 Feb 1988, 34th Nucl Sci Symp, San Francisco, CA, USA, Oct 21-23 1987 p 277-287.

## Dielectric Properties

**087537 DIELECTRIC PROPERTIES OF SYNTHETIC QUARTZ CRYSTALS.** The dielectric constant (K) and loss ( $\tan \delta$ ), hence the conductivity ( $\sigma$ ), of high-quality synthetic quartz crystals have been measured with the electric field parallel (or perpendicular) to the optical axis (c-axis). These measurements are carried out in the frequency region  $10^2$  to  $10^7$  Hz and in the temperature range 30 to 400°C. The temperature variation of K at different frequencies exhibits two regions: (i) a slow increase up to about 280°C which is frequency independent and (ii) a fast increase beyond 280°C which is frequency dependent, K having larger values at lower frequencies. Similar behaviour is exhibited by  $\tan \delta$ . Log  $\sigma$  against  $1/T$  plots show the usual extrinsic and intrinsic regions. The values for activation energy for conduction in the intrinsic region are calculated. (Edited author abstract) 16 refs.

De, Alok (Indian Inst of Technology, Kharagpur, India); Rao, K.V. *J Mater Sci* v 23 n 2 Feb 1988 p 661-664.

## Etching

**087538 VECTORIAL ANALYSIS FOR THE NUMERICAL SIMULATION OF THE SURFACE PROFILES OF ETCHED SINGLY-ROTATED QUARTZ PLATES.** The comparison of the theoretical etch profiles with the Z' etch profiles produced by repeated etchings on some singly-rotated quartz plates shows a complete agreement. A precise drawing of the etch rate-orientation relationships related to singly-rotated quartz crystals etched in a concentrated bifluoride solution is proposed, taking into account the results of the numerical simulation. The corrected etch rate vs. orientation plot is found to satisfy all the features required for the formation of etch profiles which exhibit the typical shapes observed experimentally. From the consistency between the experimental results and the theoretical results deduced from a kinematic theory of the dissolution, we can conclude that the shape of the etch profiles is essentially determined by the orientation of the quartz plate in agreement with a great number of previous experimental works. (Edited author abstract) 38 Refs.

Tellier, C.R. (Ecole Natl Supérieure de Mécanique et des Microtechniques, Besançon, Fr); Vialle, N.; Vaterkowski, J.L. *Surf Coat Technol* v 34 n 4 Jun 7 1988 p 417-439.

## Flotation

**087539 CATIONIC FLOTATION OF QUARTZ FROM AN ARTIFICIAL MIXTURE WITH HEMATITE USING HEXYLAMINE.** The cationic flotation of quartz was carried out from an artificial mixture (1:1 by weight) of fine grained ( $-10 \mu\text{m}$ ) quartz and hematite, using hexylamine acetate (HAA) and dodecylamine acetate (DAA) as collectors. Selective flotation of quartz was possible in the pH range 9-10 using HAA. The adsorption densities of DAA and HAA on quartz and hematite were measured at pH 9.8 and the relationship between the flotation behavior of both minerals and the surface coverage of collectors was established. (Edited author abstract) 29 refs.

Takeda, S. (Tohoku Univ, Sendai, Jpn); Usui, S. *Colloids Surf* v 29 n 2 Jan 29 1988 p 221-232.

**087540 FLOTATION SEPARATION OF COARSE GRAINED QUARTZ FROM A MIXTURE WITH HEMATITE FINES IN ALKALINE MEDIA IN RELATION TO THE ADSORPTION OF DODECYL AMMONIUM ACETATE.** Cationic flotation of coarse grained quartz from an artificial mixture with fine grained hematite was investigated in alkaline media (pH 9.8) using dodecyl ammonium acetate as a collector. Individual flotation of quartz and hematite was also carried out for comparison. Complete flotation of quartz is achieved at a surface coverage of DAA of about 6%, while complete flotation of hematite requires as much as 70% of surface coverage. Negative zeta potential of hematite becomes zero at an adsorption density of DAA corresponding to about 100% of surface coverage. This supports the adsorption mechanism of undissociated free amine molecules on fine grained hematite particles. Floatability of quartz decrease in the presence of hematite fines in spite of the fact that quartz acquires a sufficient amount of surface coverage of DAA, indicating that the depression of quartz flotation cannot be interpreted in terms of collector consumption by hematite fines. Depression of quartz flotation in mixed suspensions is due to the slime coating with hematite fines. (Edited author abstract) 30 refs. In Japanese.

Takeda, Susumu (Tohoku Univ, Jpn); Usui, Shinnosuke; Matsuoka, Isao. *Nippon Kogyo Kaishi* v 103 n 1198 Dec 1987 p 859-864.

## Ion Exchange

**087541 ELECTRODIFFUSION (SWEEPING) OF IONS IN QUARTZ - A REVIEW.** Sweeping, a high-temperature process that selectively exchanges monovalent ions in quartz, is reviewed. Sweeping is used commercially to replace interstitial alkalis with hydrogen. Electrodifffusion improves the radiation hardness of quartz oscillator crystals and lowers the etch channel density. Sweeping affects the substitutional aluminum with its associated alkali and the extended dislocation networks with their precipitated impurities. At high temperatures the interstitials are freed and swept down the open Z-axis channels by an applied electric field. These interstitials can then be swept out at the negative electrode, provided replacement ions, usually hydrogen, are brought in at the positive electrode. Thus, the alkali associated with the aluminum is replaced by a hydrogen, and the precipitates in the dislocation networks are modified so that they are less reactive to the etchants. With the field applied at a room temperature, a peak or plateau in the sample current is observed during warm-up near 250-300°C, followed by a decay at the 500°C sweeping temperature. When the current becomes steady, the sweeping is thought to be complete. While infrared and high-temperature resistance measurements are useful, EPR techniques seem to provide the most reliable test for complete ion exchange at the aluminum site. 61 refs.

## Measurements

**087542 IMPROVED METHOD FOR MEASURING QUARTZ CRYSTAL PARAMETERS.** A procedure is developed for measuring a crystal that involves calculating its admittance from the voltage transfer function of a suitable network incorporating the crystal. This admittance can be expressed in the form of a circle. Two initial measurements are taken from which an approximate circle is calculated. This circle is used to calculate the optimum measurement positions for the subsequent curve-fitting routines, those positions being symmetrically placed around the series resonance. Each measurement is an

average of a number of samples. The deviation from this average as well as the deviation from the circle defined by previous measurements is used to monitor the measurement. All the parameters are calculated by least-square curve fitting of the admittance circle and the variation of phase around the circle with frequency. Any measuring circuit complying with that specified by IEC standard 444 can be used, provided that it is computer controllable. The technique is flexible in that the user can choose between speed and accuracy. 5 refs.

**Microstructure** See Also GEOLOGY—Switzerland.

**087543 GRAIN-BOUNDARY MIGRATION MICROSTRUCTURES IN A NATURALLY DEFORMED QUARTZITE.** In this study several grain-scale microstructures are presented that are thought to demonstrate the migration direction of once-mobile grain boundaries in a naturally deformed quartzite. An analysis is presented of the sense of migration of the boundaries, and the characteristics of the patterns of relative grain growth and shrinkage. Grain-boundary migration seems to be correlated with the relative crystallographic orientations of neighboring grains for the quartz-quartz grain boundaries, and the pattern of preferred grain growth is roughly symmetrical about the mica foliation plane. (Author abstract) 11 refs.

## Optical Properties

**087545 LOW TEMPERATURE PHOSPHORESCENCE AND THERMOLUMINESCENCE OF QUARTZ CRYSTALS.** The low temperature phosphorescence (below 50 K) and the thermally stimulated luminescence (TSL) of quartz in the range 10-360 K were investigated. Measurements were taken separately on samples from pure x- and pure z-growth sections, and remarkable differences in the TSL of the two growth section samples were found. A variety of TSL peaks were observed and thermal activation energies, emission spectra and order of kinetics were determined for most observed peaks. The low-temperature phosphorescence as well as many of the peaks in +Y and +Z samples, were found to emit at 380 nm. This emission was assigned to the release of electrons from various trapping levels and their recombination at the same luminescence center. The low temperature phosphorescence was found to be enhanced by a double irradiation procedure in a way similar to that needed for the production of the 190 K TSL peak. A tentative model for the emission of the low-temperature phosphorescence is suggested. (Edited author abstract) 20 refs.

## Phase Transitions

**087546 BIREFRINGENCE AND  $\gamma$ -RAY STUDY OF THE IRREVERSIBLE BEHAVIOUR OF THE INCOMMENSURATE PHASE OF QUARTZ.** After a short history of the discovery of the incommensurate

phase of quartz, its properties are briefly presented. New results obtained mainly by birefringence measurements are presented on various irreversible phenomena (global hysteresis, time dependent pinning, and memory effect) which show the great influence of chemical impurities on the properties of the inc. phase of quartz. A simultaneous measurement by birefringence and  $\gamma$ -ray diffraction shows that these effects are produced by defect pinning of the inc. modulation. (Author abstract). 31 Refs.

**Physical Properties** See Also CALCITE—Physical Properties.

**087547 CALCULATED CONVERSION RATE OF  $E_4'$  CENTERS INTO  $E_2'$  CENTERS IN ALPHA QUARTZ.** Recent cluster calculations by J.K. Rudra et al. are used to obtain a pseudo-Jahn-Teller adiabatic energy profile for the interconversion between  $E_4'$  centers and  $E_2'$  centers based on the structural models proposed. Reasonable values are obtained for the underlying parameters which lend some further support to the models. A reaction rate method is used to compute the temperature dependence of the conversion rate in either direction, as well as of the rate for reorientational flopping of Fowler's  $E_1'$  center. Thermally-activated tunneling is found to be the main factor controlling the conversions in most of the temperature range of any practical interest. (Edited author abstract) 9 refs.

**Radiation Effects** See Also RESONATORS, CRYSTAL—Radiation Effects.

**087550 IRRADIATION EFFECTS ON THE LOW-TEMPERATURE THERMOLUMINESCENCE (TSL) OF QUARTZ CRYSTALS.** The TSL of synthetic quartz below room temperature (RT) was examined for x- and z-growth zone samples. Preirradiation at 320 K by  $10^4$ , 5 MeV electron pulses reduced very much the TSL peaks in the range 115-230 K and a peak at 70 K. Other TSL peaks below 110K did not change much, while peaks at 252 and 265 K were enhanced by the electron preirradiation. Room temperature X-preirradiation caused most TSL peaks first to increase, and they started to decrease only after several hours of RT irradiation. New TSL peaks at 136, 161 and 181 K appeared after

comparatively short RT irradiations. (Edited author abstract) 11 refs.

**087551 DIELECTRIC PROPERTIES OF SYNTHETIC QUARTZ CRYSTALS IRRADIATED WITH  $\gamma$ -RAYS OR X-RAYS UNDER A HIGH ELECTRIC FIELD.** This note reports the results of measurements on dielectric constant and loss, hence conductivity, of synthetic quartz crystals irradiated with  $\gamma$ -rays or X-rays under a high electric field. The decrease in activation energy for conduction in the intrinsic region may be ascribed to the increase in charge carrier concentration. The quenched quartz crystals  $\gamma$ -ray irradiated for 90 h exhibit the lowest activation energy indicating that these samples contain the largest concentration of defects. 11 refs.

**087552 COMPARISON OF LONG-RANGE ACTIVATION TRANSFER IN GAMMA-RADIOLYSIS OF SINGLE CRYSTALLINE QUARTZ WITH AMORPHOUS SILICA.** [?]. Gamma-radiolysis of single crystalline quartz and amorphous fused silica of high purity was studied at 77 K by ESR spectroscopy. The aluminum-hole centers ( $Al_{\text{c}}^{+}$ ) in the  $\gamma$ -irradiated quartz, appear at doses as low as 250 rad. Their yields increase with increasing dose and reach plateau values at approx.  $10^4$  rad. The yields of the radiation damages, such as the oxygen-associated hole centers,  $E'$  centers and H atoms, in  $\gamma$ -irradiated silica, however, increase with increasing dose up to  $5 \times 10^6$  rad without reaching plateau values. The  $[Al_{\text{c}}^{+}]$  centers in quartz are also produced by illumination with 185 nm light. The G-values of radiation damages in quartz and silica were measured. The efficient production of the  $[Al_{\text{c}}^{+}]$  centers in the  $\gamma$ -irradiated quartz was interpreted in terms of long-range migration of mobile entities, such as a hole and an exciton. The migration range was estimated from the G-values and concentration of impurities. The mobile entities in quartz migrate through  $10^4$ - $10^5$   $SiO_2$  units, whereas those in silica migrate onl through 5-50  $SiO_2$  units. (Edited author abstract). 13 Refs.

**087553 STUDY OF THE SURFACE OF FUSED QUARTZ BY AUGER SPECTROSCOPY: INFLUENCE OF MELTS OF ALKALI-METAL BROMIDES ON THE CHEMICAL STABILITY OF SILICA GLASS.** In order to determine the influence of the cationic composition of melts on the chemical stability of gas-fused silica, we studied the interaction of silica glass with melts of alkali bromides in an inert medium (argon) under isothermal conditions at  $T = 1073$  K. Since the effects studied occur on the glass surface we used Auger electron spectroscopy (AES), as a sensitive method for analysis of surface layers, for studying these effects. It is found that the cationic composition of alkali bromide melts has a strong influence on the corrosion resistance of gas-fused quartz glass. Alkali-metal ions diffuse to a depth of 50  $\mu\text{m}$  from salt melts at  $T = 1073$  K. Bromide ions were not detected in Auger spectra of glasses treated with alkali bromide melts. 6 refs.

**087554 LIGHT SCATTERING FROM E-SYMMETRY AMPLITUDE IN THE INCOMMENSURATE PHASE OF QUARTZ.** Low frequency depolarized Raman spectra of quartz were investigated in the incommensurate phase near the  $\alpha$ - $\beta$  transition at  $T_c = 573^\circ\text{C}$ . A

weak mode, but underdamped in the temperature region close to the commensurate  $\alpha$  phase, was observed at about  $8\text{ cm}^{-1}$  with an intensity proportional to the square of the order parameter. The mode is assigned as the E-symmetry amplitudon which has been predicted to exist in the '3-k state' of the incommensurate phase, in addition to a totally symmetric A-amplitudon. (Author abstract) 13 refs.

## Spectrum Analysis

**087555 FAR INFRARED TRANSMISSION OF CRYSTAL QUARTZ AT 3 K.** We present transmission measurements of Z-cut crystal quartz at 3 K in the wavenumber range 60-180  $\text{cm}^{-1}$ . The results show that the absorption is extremely small and in fact on the average a factor of ten smaller than indicated by earlier measurements discussed in the literature. One consequence of our results is that crystal quartz is useful in the FIR as a substrate material for Fabry-Perot meshes used in cryogenic experiments. (Author abstract) 4 refs.

## Surfaces

**087556 STABILITY OF THE HYDRATE LAYER ON THE SURFACE OF FUSED QUARTZ.** In this paper we report the results of a study of the hydrate layer on the surface of fused quartz. Certain resemblances were expected between silica samples of different structures and silicon coated with a thin film of natural oxide. The results demonstrate that the boundaries of stability of the hydroxyl layer are the same, 200°, on fused quartz as on silica gel. At higher temperatures the stability of OH groups is lower than on finely divided silicas. The rehydroxylation curve also shifts somewhat to lower temperatures. It is shown that the state of the hydrate layer on silicon is determined by the presence of an oxide layer on its surface. 12 refs.

**087557 THREE-PHASE CONTACT LINE MOVEMENT IN SYSTEMS WITH AND WITHOUT SURFACTANT.** The dependence of the receding contact angle on the speed of movement of the three-phase contact (tpc) after rupture of the thin liquid film during bubble/solid interaction has been investigated. The motion of the type on a quartz surface covered with an octadecylamine monolayer is described using molecular and hydrodynamic theories. For a surfactant-containing system (quartz/dodecylamine solution/air) it was found that the experimental results cannot be described completely by these theories. These discrepancies are thought to be due to surfactant transfer from the liquid/gas to the solid/gas interface during receding tpc motion, resulting in a decrease of the surfactant at the liquid/gas interface. (Author abstract). 11 Refs.

Hopf, W. (Acad of Sciences of German Democratic Republic, Freiberg, East Ger); Stechemesser, H. *Colloids Surf* v 33 n 1-2 Aug 1988 p 25-33.

**087558 FORCES BETWEEN QUARTZ SURFACES BEARING ADSORBED MACROMOLECULES IN GOOD SOLVENTS.** Direct measurements of interaction energy between two quartz glass filaments immersed in aqueous electrolyte solution have been carried out as a function of surface separation. The interaction profiles of poly(vinyl alcohol) (PVA), poly(vinyl pyrrolidone) (PVP), poly(ethylene oxide) (PEO) and methylhydroxypropylcellulose (MHPC) were estimated in aqueous electrolyte solution. The measurements were carried out with frac-

tionated and unfractionated polymers as well as with homo- and copolymers. In pure aqueous electrolyte solution the interactions were repulsive. Following 8-h adsorption of polymer the interactions were always repulsive, independent of the polymer sample. (Edited author abstract) 40 refs.

**087561 ELECTRICALLY DRIVEN FLEXURAL RESONANT MODES IN SYMMETRICALLY ELECTRODED X-CUT AND Z-CUT QUARTZ DISCS.** While it is well known that flexural mechanical resonant modes can be electrically driven in specimens of quartz and other piezoelectric materials by the judicious choice of electrode patterns, specific experimental data, based on simultaneous interferometric observations of opposite surface points, are presented to show that symmetrically electroded X-cut and Z-cut quartz discs exhibit flexural resonant modes of quite large amplitudes. These resonances are not accompanied by detectable electrical disturbances in the AC-drive circuits. The existence of these modes is demonstrated for an X-cut quartz disc, and specific resonant modes of a Z-cut quartz disc are characterized in detail. 10 refs.

## X-Ray Analysis

**087563 INVESTIGATION OF QUARTZ CRYSTALS WITH NON-HOMOGENEOUS DISTRIBUTIONS OF IMPURITY ATOMS BY X-RAY METHODS.** Long and section topography in transmission, plane wave topography in reflection, and precision lattice parameter determination are applied to the study of step like impurity atom distributions. The possibilities to describe the deformation fields anisotropic connected with these distributions by means of the theory of elasticity including effects are discussed. The applicability and limits of the methods for the measurement of deformation fields are investigated theoretically and experimentally. All methods yield the same values of parameters (step height and width) of the model within the ranges of experimental accuracy. Using the anisotropic theory of elasticity the results of the lattice parameter determination can yield information about the anisotropy of the quasi-plastic dilatation due to the defects. (Edited author abstract) 30 refs.

**087564 ROLE OF HIGH SPEED FFT IN RADAR SIGNAL PROCESSING.** We describe the application of high speed fast fourier transform (FFT) processors in realtime radar signal processing. Three coherent radar signal processing techniques are considered: pulse Doppler radar (PDR); beamforming radar; and synthetic aperture radar. The emphasis of this paper is to apply low order (less than 64-point) FFTs to radars. As the number of FFT points increases, the computational requirements increase at a higher rate, since an N-point FFT requires  $\{N/2 \log_2 N\}$  complex multiplications and several additions. 7 refs.

**087565 DETECTION PERFORMANCE OF MEM PROCESSOR IN RADAR APPLICATIONS.** Fast Fourier Transform (FFT) technique has been in use for processing the radar signals in doppler domain. The introduction of Maximum Entropy Method (MEM) by Burg has revolutionized the field of non-linear spectral estimation. Since MEM processor can yield high resolution spectral estimates even with short data lengths, it is becoming a good candidate for doppler domain processing of radar signals. In this paper, we obtain probability density functions for MEM spectra and show that they closely follow log-normal density function. The usual

detection performance criteria, i.e., probability of detection ( $P_d$ ) and probability of false alarm ( $P_{fa}$ ) are then obtained using log-normal density function. The detection performance of MEM processor is compared with that of FFT processor. It is observed that the MEM processor can yield better results compared to FFT processor when the doppler frequency of the radar return from a target does not coincide with the center frequencies of the FFT filter bank. (Author abstract) 10 refs.

**087574 MONOGENIC FUNCTION RANGE RESOLUTION RADAR.** Sequences having peaky autocorrelation are useful in range resolution radar and in a homomorphic problem of detecting reflections in seismic exploration. The concept of correlative signal processing for system identification in these applications is extended to processing based on monogenic signatures. Some sequences having good monogenic signatures are listed. These yield sequence compression equal to the length of the sequences, and peak/sidelobe ratios or merit factors could be superior to those obtainable in correlative processing for the same length of sequences. The problems

in developing monogenic function radar are discussed and some solutions proposed. (Edited author abstract) 23 refs.

**087575 DISTORTION OF COMPLEX SIGNALS IN RADAR FREQUENCY CONVERTERS IN THE PRESENCE OF HETERODYNE-VOLTAGE INSTABILITY.** Much attention is now being paid to radio systems that employ coherent processing of complex microwave (MW) signals, which permits a substantial improvement in the energy and accuracy characteristics of the radio systems, but with a sharp increase in the amount of distortion of signals in amplifier-converter channels. Signal distortion by modulating interference is determined in such systems by the parameters of the signal interdependency function. It is important to determine the way in which the levels of the undistorted part and the interference component of this function depend on heterodyne-voltage instability in the millimeter waveband, since the avalanche-drift diodes (ADD) and Gunn diodes (GD) used as oscillators in this band have good modulation sensitivity with respect to amplitude and frequency. Formulas are derived which make it possible to evaluate the influence of the characteristics of heterodyne active elements and parameters of the heterodyne power source on signal distortion in frequency converters. 4 refs.

**087576 SYSTEMATIC BEHAVIOR OF SIGNAL STATISTICS OF MST RADAR ECHOES FROM CLEAR AIR AND THEIR INTERPRETATION.** Signal statistics of data from the SOUSY-VHF radar were analyzed. Mean, variance, skewness and kurtosis of the distribution of the quadrature components of the signals as well as Nakagami coefficient of the amplitude distribution were calculated. We found a systematic behavior in the correlation between kurtosis and Nakagami coefficient, and we propose a stochastic model for its explanation. These stochastic effects on the signal are generated in the variable echoing process itself. Numerical simulation and analytical calculation of the model were carried out for comparison with the data. (Edited author abstract) 9 refs.

**087577 EFFECTS OF VARIATION IN LOOK ANGLE AND WAVELENGTH IN RADAR IMAGES OF VOLCANIC AND AEOLIAN TERRAINS, OR NOW YOU SEE IT, NOW YOU DON'T.** A variety of geological targets can have similar radar backscatter and be indistinguishable when observed at particular wavelengths and/or look angles. Smaller look angles can provide images with superior surface type discrimination for areas of modest relief. In areas of low sand dunes when subsurface radar imaging can occur, it is possible to observe the surface dunes at one look angle and the subsurface at another. Multi-angle multiple wavelength images would increase the ability to interpret an observed landscape correctly. These observations have implications for the interpretation of radar images of other planets such as Venus. (Edited author abstract) 32 refs.

Blom, Ronald G. (JPL, Pasadena, CA, USA). *Int J Remote Sens* v 9 n 5 May 1988 p 945-965.

**087578 INTRODUCTION TO SUBSURFACE RADAR.** Subsurface radar techniques are increasingly being used for the detection and location of buried artifacts and structures within the upper regions of the earth's surface.

The paper reviews the work done to date in this field, laying emphasis on the range of applications and the need for system design to match the intended application. An overall design strategy is outlined, together with a more detailed treatment of a range of topics which are relevant to effective subsurface radar operation. These include the dielectric properties of earth materials, signal modulation schemes, design and construction of suitable antennas, and methods of signal processing. An assessment is made of future prospects, both technical and commercial, for this developing area of radar technology. (Edited author abstract) 224 Refs.

**087579 EARLY DEVELOPMENTS IN GROUND-PROBING RADAR AT ERA TECHNOLOGY LTD.** A survey of the developments in ground-probing radar technology is presented, including hardware, software and field experience. Radars of advanced design with wide dynamic ranges, high resolution and capable of much higher data rates than previous systems have been built. They incorporate important developments in antennas, pulse generators and receiver design. The use of digital circuitry wherever possible has allowed great flexibility in the design, allowing signal processing to be readily included in real-time systems. A hierarchy of software has been implemented ranging from simple detection procedures to advanced target recognition algorithms. Ground-probing radars have been operated in a wide range of conditions for the detection of plastic mines, the inspection of civil engineering structures and the assessment of mineral resources. (Edited author abstract) 4 Refs.

**087580 SPECIFICATION, CALIBRATION AND TESTING OF PHASE INTERFEROMETERS.** Electronic warfare (EW) systems use radar pulse parameter measurements for threat detection, identification and location in order to apply countermeasures. Phase interferometers are of interest in EW systems because they provide a wide instantaneous field-of-view, a nearly constant system sensitivity across the field-of-view, and AOA (angle-of-arrival) measurement accuracy that is not a function of antenna gain. The inherently wide field-of-view and the greater AOA measurement accuracy make the phase interferometer an ideal candidate for AOA measurements used for pulse signal sorting applications. In this article particular emphasis is placed on the technical issues relating to system tradeoffs needed to adequately specify the performance of a phase interferometer, different methods of calibrating the phase interferometer, and how to test the performance of the phase interferometer. A short discussion of interferometer theory also is provided. 10 refs.

**087581 RADAR TARGET SIGNAL MODELING AND VALIDATION.** The performance of a radar system is greatly affected by the electromagnetic scattering properties of the targets to be tracked. A key target parameter is the radar cross section, defined as an effective area that scatters incident power in the direction of the radar receiver. Two target modeling approaches used at Raytheon and their validation are described. One of the methods computes a composite signal and equivalent cross section and glint from a number of discrete point scatters. The other method, a statistical model, combines filtered and scaled noise sources from a random number generator to produce the desired results. The outputs presented include plots of sample radar cross section, glint and angle tracking error histories as functions of target aspect and target aspect rate. There are also comparisons of results computed by the two methods, as well as with actual flight data. (Author abstract) 7 refs.

**087582 DEPENDENCE OF SPECKLE STATISTICS ON BACKSCATTER CROSS-SECTION FLUCTUATIONS IN SYNTHETIC APERTURE RADAR IMAGES OF ROUGH SURFACE.** A theory is described to relate the statistical properties of the fields backscattered from rough surfaces to those of speckle in synthetic-aperture radar (SAR) images. Expressions are derived for the autocorrelation and cross-correlation functions of speckle intensity in both single-look and multilook images of stationary random rough surfaces in terms of the SAR system parameters and the autocorrelation function of the backscatter radar cross-section (RCS) fluctuations. It is shown that if the correlation scale of RCS fluctuations is comparable with or greater than SAR resolution, the correlation function of speckle intensity depend on those of the RCS fluctuations. This property, therefore, may be applied to image classification. Comparison of the theory with computer simulation shows good agreement. 13 refs.

**087583 CONSEQUENCES OF NONORTHOGONALITY ON THE SCATTERING PROPERTIES OF DIHEDRAL REFLECTORS.** The physical optics method was used to study the reduction of radar cross section (RCS) due to variation of the internal angle of a dihedral corner reflector. Singly, doubly, and triply reflected contributions are considered, so the results obtained are valid for all dihedral reflectors with internal angles greater than 60°. The reduction, RCS achievable for a given deviation from orthogonality, is dependent on the size of the reflector, in terms of wavelength of the incident radiation. For plate sizes in excess of a few wavelengths, very significant reductions in backscattered RCS can result from quite modest deviations from orthogonality. Nonorthogonality introduces deep interference nulls that are a function of plate size and the deviation angle into RCS patterns of these reflectors. It is shown that a small deviation angle in a reflector can meet the conditions for a interference null along the axis of symmetry. 5 refs.

**087584 RADAR POLARIMETER MEASURES ORIENTATION OF CALIBRATION CORNER REFLECTORS.** The authors analyzed radar polarimeter signals from a set of trihedral corner reflectors located in the Goldstone Dry Lake in California, and observed three types of scattering behavior: i) Bragg-like slightly rough surface scattering that represents the background signal from the dry lake, ii) trihedral corner reflector scattering that returns the incident polarization, and iii) two-bounce corner reflector scattering resulting from a particular alignment of a trihedral reflector. In the latter case it is possible to measure within about 3° the orientation angle

of the apparent dihedral trough, even though the 2-m reflector is much smaller than the 10-m resolution element of the radar. Thus a radar calibration approach using trihedral corner reflectors is ensured, as three-bounce and two-bounce geometries lead to different cross sections and hence different inferred calibration factors. 8 refs.

**087585 HOW TO DESIGN AN 'INVISIBLE' AIRCRAFT.** Techniques for reducing radar cross sections to make aircraft harder to detect are examined. Studies to determine what elements contribute to the radar signature are discussed. The use of models and chambers that simulate the impact of radar on a distant target to test the effectiveness of proposed techniques is considered. The need for outdoor testing is discussed. 5 refs.

**087586 RADAR BACKSCATTER CHARACTERISTICS OF TREES AT 215 GHz.** Millimeter-wave backscatter measurements are presented for various tree types taken during the 1987 growing season at Amherst, Massachusetts. These measurements were taken with a 215-GHz radar system that is capable of measuring backscatter for the VV (vertical transmit, vertical received), HH (horizontal transmit, horizontal received), VH, and HV polarizations. Geometrical optics modeling was used for the normalized radar cross section (RCS) of deciduous trees and the backscatter is shown to be characterized in terms of gravimetric leaf water content, the leaf area, and the foliage crown cover. Data are also provided for coniferous trees, although the geometrical optics model is not applicable in those cases. 15 refs.

**087587 EXTINCTION CROSS SECTION OF A DIELECTRIC STRIP.** The problem of scattering of a plane electromagnetic wave by a dielectric strip is formulated in terms of an uncoupled system of three-part Wiener-Hopf equations by using a set of approximate boundary conditions derived and utilized recently. The resulting Wiener-Hopf problems are solved approximately for sufficiently large values of the width of the strip by using D. S. Jones' method (1964). An analytical formula is derived for the excitation cross section of the strip under consideration from which numerical values are obtained in specific situations and the results are presented graphically. The radar cross section of the strip is also computed for several special circumstances and these are presented separately. 10 refs.

**087588 MOON AS A CALIBRATION TARGET OF CONVENIENCE FOR VHF-UHF RADAR SYSTEMS.** Knowledge of the absolute, versus relative, performance characteristics of VHF and UHF radars used in geophysical applications is often important. We suggest that the Moon may form a convenient, easily tracked calibration target for many such radars. The lunar absolute radar scattering cross-section is large, reasonably well known (approx. 7% of the visible disk) and is essentially wavelength independent over  $6\text{ m} > \lambda > 1\text{ cm}$ .

The Arecibo 430-MHz radar system was calibrated using the Moon as the target. These measurements yielded cross sections of 4.0% and 4.6% for a special 6 w and the main 1.6-Mw transmitters, respectively. We develop and present the radar equation appropriate to all total power calibration procedures including the Arecibo 'worst case' calibration. We also discuss error levels, the necessity for averaging to obtain valid cross sections, and other practical difficulties associated with the technique. (Edited author abstract) 30 refs.

## Marine

**087589 X-BAND FMCW NAVIGATION RADAR.** Frequency Modulated Continuous Wave (FMCW) Radar has long been of interest. A 3 W solid state experimental X-band marine surface search and navigation radar has been built and evaluated. The construction of such a radar has been shown to be eminently practicable. The radar has a completely solid state transmitter with low weight and high reliability which has been mounted directly behind the antennas, avoiding the need for rotating r.f. feeds and long waveguide runs.

Stove, A.G.; Beasley, P.D.L. *Annu Rev Philips Res Lab* 1986 p 100-101.

## Materials

**087590 MATERIALS KEEP A LOW PROFILE.** In addition to the military's quest for bombers and fighter planes that can penetrate enemy territory unnoticed, there is also a need to hide ground-based objects from radar detection by aircraft. Covers for microwave transmitters or radar antennae, known as radomes, must protect the equipment inside while allowing signals to enter and exit without significant interference. Most nonmetallic materials are reasonably transparent to electromagnetic radiation (EMR). However, in the microwave region where most radars operate, the materials must be used carefully to prevent reflection and excessive absorption. Properties that are important for maximum transmission of EMR are a low dielectric constant and a low loss tangent.

**087593 IMPULSE RADAR FOR IDENTIFICATION OF FEATURES IN SOILS.** In soils developed in

loess over glacial till, the presence and depth to clay layers, or fragipans, and other features are identified with radar. Radar evaluation of depths to soil features compares well with the soil pit and core descriptions by traditional methods. Regressions of radar-derived, actual depths of soil features are used to calibrate radar measurements. The calibration approach is verified by evaluation of radar depths and actual depths of soil features in five cores taken on the same transect, away from the pits. Radar measurements of depths to features in soils have several practical applications. (Author abstract) 20 refs.

**087594 ESTIMATE OF THE ERROR, INTRODUCED BY ATMOSPHERIC TURBULENCE IN A MEASUREMENT OF THE RADIAL VELOCITY COMPONENT OF AN OBJECT BY A HETERODYNE RADAR.** When a wave of frequency  $f_0$  is reflected from an object moving with a radial velocity, a change occurs in its frequency because of the Doppler effect, as a result of which the radial component of the velocity of the object can be determined from the magnitude of the Doppler shift. Because wave propagation occurs in a turbulent atmosphere, the error in measuring the radial velocity depends on the conditions of the atmosphere. This error is evaluated. 5 refs.

**087596 ESTIMATING SOIL WATER EVAPORATION USING RADAR MEASUREMENTS.** Field studies were conducted to evaluate the application of radar reflectivity as compared with the shortwave reflectivity (albedo) used in the Idso-Jackson equation for the estimation of daily evaporation under overcast sky and subhumid climatic conditions. Soil water content, water potential, shortwave and radar reflectivity, and soil and air temperatures were monitored during three soil drying cycles. The data from each cycle were used to calculate daily evaporation from the Idso-Jackson equation and from two other standard methods, the modified Penman and plane of zero-flux. All three methods resulted in similar estimates of evaporation under clear sky conditions; however, under overcast sky conditions, evaporation fluxes computed from the Idso-Jackson equation were consistently lower than the other two methods. The shortwave albedo values in the Idso-Jackson equation were then replaced with radar reflectivities and a new set of total daily evaporation fluxes were calculated. This resulted in a significant improvement in computed soil evaporation fluxes from the Idso-Jackson equation, and a better agreement between the three methods under overcast sky conditions. 16 refs.

**087597 LE RADAR METEOROLOGIQUE DE TRAPPES ET L'ESTIMATION DES INTENSITES PLUVIEUSES EN SEINE-SAINT-DENIS. INTERET POUR LA GESTION DES RESEAUX D'ASSAINISSEMENT.** [Trappes' Meteorological Radar and Estimation of Rainfall Intensities in Seine-Saint-Denis]. The computer-assisted management scheme concerning the storm sewer system requires that the measurement and rainfall intensity forecast techniques be improved. The recording rain gauge networks have insufficiencies which should be made up for by weather radar. The study relating to this article seeks to assess the radar capacity for determining precipitations for the requirements of urban hydrology and this is based on a two months' campaign conducted during the Summer of 1982. Following a qualitative analysis of the data collected, various adjustment techniques relating to radar images were tested. The results obtained were compared with those deduced from an interpolation of rain gauge measurements alone. The role of the radar as part of the computer-assisted management scheme is being delineated. Simulation tests concerning the flow rates in urban catchment basins were carried out after an approximation of the effect of the surface water model in relation to precipitation measurement uncertainties was made. **087598 DEVELOPMENT OF KU-BAND FM-CW/PULSE-COMPRESSION RADAR FOR RAIN OBSERVATION ON A SLANT-PATH.** A Ku-band FM-CW/Pulse-Compression radar was developed in order to evaluate the performance of FM-CW and Pulse-Compression radars for rain observation and further to utilize this system to the study of microwave remote sensing of rain on a slant-path. With this radar the radar signal can be transmitted from the same antenna installed for propagation data acquisition such as 11.7-GHz BSE beacon signal and 12.0-GHz sky noise temperature. This configuration allows the close comparison of radar with the propagation data without errors due to spatial discrepancy between observing volumes. This paper describes the design and characteristics of the radar and method and result of radar calibration. Through the calibration, radar sensitivity was verified to be almost equal to that anticipated from the design. (Edited author abstract) 17 refs.

**087599 VISUALIZATION OF THE INFORMATION FROM A THREE-Dimensionally SCANNING RADAR RAINGAUGE.** We developed several color graphic screens which can visually represent both the distribution of echo intensity and the shape of the three dimensionally spread precipitation field, in order to investigate how fine resolution the radar information has. By the use of VCAPPI (Various Constant Altitude Plan Position Indicator), we can visually investigate three dimensional characteristics of the precipitation phenomena in meso- $\beta$  scale. Furthermore, by the use of FVCAPPI (VCAPPI for an arbitrary specified domain) and RRHI (in the form of the arrangement of fifteen RHIs), we can visually investigate characteristics in meso- $\gamma$  scale. In the case of very heavy rainfall which arose along Baiu front on the 21 July in 1986, from FVCAPPI and RRHI we can find a convective echo consists of several echo cells in various life stages. This means the convective echo is from a multi-cell storm. This fact can also be verified from RHTI (Range Height Time Indicator), which can visually represent the time series of an echo pattern in an arbitrary vertical section, by setting the vertical section along the storm moving direction. ## Microwaves

**087602 MODELLING PROPAGATION EFFECTS IN THE USE OF S-BAND POLARISATION-DIVERSITY RADARS.** The effects of propagation through precipitation on polarization diversity radars at S-band are modelled. It is shown that in propagation through rain, although linearly polarized waves need not be significantly affected, the effect on circularly polarized returns is important. It is shown that a gate-by-gate correction process is not a satisfactory method of removing the propagation effects. However, it is shown that a derived linear parameter ZDR can be obtained from the circular parameters which is less affected by propagation. The modelling is extended to targets which comprise rain and hail. (Author abstract) 27 refs.

McGuinness, R. (Univ of Essex, Colchester, Engl); Holt, A.R.; Bebbington, D.H.O. *IEE Proc Part H* v 134 n 5 Oct 1987 p 423-430.

**087603 CORRECTION OF PROPAGATION EFFECTS IN S-BAND CIRCULAR POLARISATION-DIVERSITY RADARS.** A new method for correcting propagation effects in circular polarization diversity radars at S-band is described. By considering the transformation of the coherency matrix under the influence of propagation, it is shown that corrections can be derived from the correlation data of individual range gates. This avoids the use of any iterative gate-by-gate procedure previously shown to be unstable. Assuming the mean orientation of the precipitation particles is known to within  $1.2^\circ$ , it is found that essentially all the polarization information can be recovered with an acceptably small error. Application of the correction procedure to storm data verifies that use of the circular polarization technique at S-band can now be extended to heavy precipitation regions. (Author abstract) 10 refs.

**087605 SYSTEM APPLICATIONS OF MICROWAVE WAVES TO RADARS: MODERN TRENDS.** The impact of microwave technology on the performance of modern radar systems is outlined, together with the resulting design implications. The most advanced characteristics of the main microwave components are pointed out and proper use of combined technologies in such complex subsystems as electronically scanned antennas is shown to be essential in order to reach advanced performance and capabilities for new radars. Different types of antenna configurations are examined from the viewpoint of improvements required by the enhancement of radar characteristics. Similar considerations apply to other microwave radar subsystems. High degree of integration, use of advanced computer resource and techniques are shown to be fundamental in the design and development of advanced microwave components. Outstanding features of advanced radars, as 3D and multifunctional systems, are pointed out. The introduction of new capabilities envisaged or being introduced in radar systems has a deep impact on the requirements for microwave components. (Edited author abstract)

## Optimization

**087610 ON OPTIMIZING IMPORTANCE SAMPLING SIMULATIONS.** The importance sampling technique can result in large savings in simulation time for simulation of tail probabilities, but only when performed optimally. The authors derive criteria for optimal importance sampling simulation of an arbitrarily weighted sum of independent exponential variates. They illustrate the use of importance sampling for false-alarm threshold settings in square-law integrators and moving target indicator (MTI) delay line cancellers in the presence of Gaussian spectrum correlated clutter. For these systems, importance-sampling simulation can not be optimally performed. Hence, the authors apply a linear transformation to decorrelate the clutter and perform importance-sampling simulation optimally on the transformed system. 17 refs.

**Performance** See ALSO ELECTROMAGNETIC WAVES—Propagation; ELECTROMAGNETIC WAVES—Propagation in Troposphere; MICROWAVES—Propagation in Troposphere; SIGNAL DETECTION—Mathematical Models; SIGNAL PROCESSING—Spectrum Analysis.

**087611 PERFORMANCE OF THE GREATER-OF AND CENSORED GREATER-OF DETECTORS IN MULTIPLE TARGET ENVIRONMENTS.** The greater-of (GO) constant false alarm rate (CFAR) detector selects the greater of the leading and lagging sets of the reference noise cells to minimize the effect of clutter and jamming. The performance of the GO detector is derived for the case where an arbitrary number of interfering targets are present in the leading and lagging reference noise cells. To improve its performance in this situation, the censored greater of (CGO) detector, which discards several of the largest samples on each side is analysed. Results presented show improvements for the CGO over the GO detector, especially when the number of interfering targets is less than the number of censored cells. (Author abstract) 8 refs.

## Reflection

**087613 SECOND-ORDER SPECTRUM OF RADAR REFLECTION FROM THE SEA SURFACE.** For radar, backscattered radiation from the sea surface is calculated up to third-order terms, inclusively, in perturbation theory. An account is made of the directional pattern and the pulse characteristics of the radar radiation. The first- and second-order spectral intensities are determined, and they are compared with values in the literature. (Author abstract) 14 refs.

**087614 MULTIPATH FADINGS OVER SEA AT 94 GHz.** Radar returns from sea targets sometimes are subject to deep amplitude fadings. These are caused by cancellation of the direct path wave with the wave specularly reflected by the sea surface. This is particularly true at small grazing angles. It appears that when mm-wave radars are used, one is not likely to observe such deep fadings, even at very small grazing angles. 1 ref.

**087615 ON THE CONTRIBUTION OF VOLUME SCATTERING TO THE MICROWAVE BACKSCATTERED SIGNAL FROM WET SNOW AND WET SOIL.** The contribution of volume scattering from the subsurface stratum of soil or snow to the backscattered radar signal decreases rapidly with increasing moisture content as compared to the contribution by rough-surface scattering. In order to obtain an evaluation of the relative importance of volume scattering of moist strata, a heterogeneous two-component mixture of water inclusions in a dry background medium is assumed and the formulation of the distorted Born approximation according to L. Tsang et al. is applied. Computed permittivities and backscatter cross-sections are compared with experimental data of situations with modest moisture content. From there, conclusions on the relative portion of volume scattering and on shape and size of the effectively-scattering water inclusions can be drawn. (Author abstract) 20 refs.

## Reviews

**087616 PERSPECTIVE ON COMPLEX RADAR WAVEFORMS, ARRAYS AND PROCESSING.** The authors describe some of the more interesting and less known radar concepts. They attempt to identify potential payoffs and critical concerns. The methods discussed here were chosen so as to be generic and cover spatial, spectral

and temporal aspects of microwave signals. The topics covered are large time-bandwidth signals, distributed array radar, delta-k radar and multispectral sensor fusion. 11 refs.

## Simulation

**087617 PROCESSING OF RADAR OBSERVATION DATA BY ADAPTIVE KALMAN FILTERING.** In this paper, the processing of radar observation data is considered by an adaptive Kalman filtering algorithm. The noise statistics of the system are assumed to be unknown and time varying. Modification of the approximate model is considered by introducing the modification coefficients and fictitious noises. Simulation example shows the effectiveness of the proposed approach. (Author abstract) 5 refs.

**087618 DUAL CHAMBER DESIGN REDUCES QUIET ZONE RIPLE/TAPER ERRORS.** As experience with compact ranges increases, new problems need solving, design changes are required, and improved systems result. This is the case of a dual-chamber design; it builds on the strengths of previous concepts. The strengths of this dual-chamber design are best understood by reviewing the design process that has transpired to this point. Putting the subreflector under the chamber floor minimizes aperture blockage and feed spillover. 11 refs.

## Simulators

**087619 COMPACT RANGE TECHNOLOGY AND THE MARKETPLACE.** Compact ranges (room-sized radar range simulators) have recently attracted great interest and development efforts. This article focuses on technical issues such as the different configurations of the compact ranges, and techniques for reducing the detrimental effects of diffraction from the edges of a compact range reflector.

Johnson, R.C. (Georgia Tech Research Inst, Atlanta, GA, USA); Ryan, C.E. *Microwaves RF* v 26 n 5 May 1987 p 135-138.

**087620 TROUBLESHOOTING LIMITATIONS IN INDOOR RCS MEASUREMENTS.** Techniques for measuring radar cross-section (RCS) indoors have stirred much excitement in the last ten years. The controlled and protected indoor environment is more conducive to high-performance RCS measurements than outdoor ranges. Compact Antenna Test Ranges (CATRs), furthermore, have made it possible to make indoor, direct measurements that simulate outdoor farfield conditions. These CATRs exist in a variety of configurations, each of which has its own peculiar limitations. This article examines in detail some fundamental limitations inherent in all types of collimating devices.

**087622 SPACE-BASED RADAR: NARROWING THE MAIN-BEAM CLUTTER SPECTRUM THROUGH THE USE OF A HIGH-ASPECT-RATIO ANTENNA.** With a space-based surveillance radar, the ability to detect slow-moving targets is compromised by returns from the earth's surface illuminated by the main beam of the antenna. An antenna design is presented that minimises the spectral width of main-beam earth clutter returned to space-based radars. The design maximises the aspect ratio of the antenna and aligns its long dimension with the satellite velocity vector. This ensures that the main-beam return is concentrated between two cones of constant velocity (isodops) whose separation is inversely proportional to the length of the antenna. (Author abstract) 2 refs.

**087623 RADAR SURVEILLANCE OVER THE HORIZON.** An over-the-horizon (OTH) radar at decimetric wavelengths, corresponding to an extended high frequency (HF) band from 1 to 40 MHz, has become a practical proposition. In Britain, Marconi Radar Systems Ltd. has been active in OTH radar development and has made a major breakthrough in the development of medium range HF early warning systems. The prototype equipment gives complete air cover up to 300 km. A fully operational system could become available within two years. The phenomenon that Marconi Radar Systems has exploited in its system is that of vertically polarized surface wave propagation. The HF transmissions induce currents in the saline sea water that are coupled to electromagnetic wave travelling in the air over the sea surface. The transmitted signals are frequency modulated carrier waves (FMCW) and target range is measured by the frequency shift of the received signal. The separation of the Doppler-shifted frequencies is achieved by digital filtering using Fourier transform calculations.

Presdee, A.W. *Eng Dig (Toronto)* v 33 n 2 Feb 1987 p 28, 35.

**087624 OPTIMIZATION OF SURVEILLANCE RADAR WITH INSTRUMENTED RANGE.** The influence of the instrumented range on the selection of radar parameters for maximal detection range is described. Procedures for optimization of the performance of the radar by an appropriate setting of its parameters, for the specified instrumented range, are presented. 5 refs.

**087625 SYNTHETIC APERTURE RADAR (SAR) IMAGES OF MOVING TARGETS.** A method of isolating moving targets in airborne SAR data, by filtering to image only those targets within a certain radial velocity band, is presented. Corresponding SAR ground map and moving target indication (MTI) examples are given, showing good clutter cancellation and negligible overlap

between MTI bands. The examples are also used to illustrate the types of image defects which occur in SAR images of moving targets. (Edited author abstract) 14 refs.

Freeman, A.; Currie, A. *GEC J Res* v 5 n 2 1987 p 106-115.

**087626 RESULTS OF RESEARCH AND DEVELOPMENT ON SYNTHETIC APERTURE RADAR.** A synthetic aperture radar (SAR) is one of the promising microwave sensors for Earth observation. National Space Development Agency of Japan (NASDA) started preliminary study in FY 1978, recognizing the importance of active microwave remote-sensing. The research and development proceeded to definition/design phase in 1980, after the Earth Resources Satellite-1 (ERS-1) program was proposed. After the technology development on some technically critical components, the final SAR system test was completed in September 1985. Step by step, we could confirm that the design goal we had set up could be achieved. (Author abstract) 8 refs.

**087627 APPLICATION OF PREDICTIVE COMPRESSION METHODS TO SYNTHETIC APERTURE RADAR IMAGERY - I.** Owing to the rapidly decaying autocorrelation function of synthetic aperture radar (SAR) imagery, predictive compression methods have not been widely used in image coding systems designed for SAR data. Because of the uncorrelated nature of SAR data, the prediction system design problem is approached from the point of view of statistics matching and decorrelation of reconstruction errors rather than minimization of the mean square error. It is demonstrated on 6 m resolution SAR magnitude data that a simple predictive coding system utilizing an unadaptive moving-average (MA) predictor and a Gaussian optimal quantizer can result in satisfactory reconstructed imagery at compression ratios of 2:1 to 4:1. Advantages of MA predictors are their lack of stability problems and their limited memory in the presence of channel errors. (Author abstract) 28 refs.

Werness, Susan A.S. (Environmental Research Inst of Michigan, Ann Arbor, MI, USA). *Opt Eng* v 26 n 12 Dec 1987 p 1200-1209.

**087628 APPLICATION OF PREDICTIVE COMPRESSION METHODS TO SYNTHETIC APERTURE RADAR IMAGERY - II.** Synthetic aperture radar (SAR) imagery can be described as consisting of bright point objects embedded in homogeneous or textured low intensity backgrounds. When predictive coding is used to compress such data, high quality reconstructions and larger compression ratios are obtained if large predictive errors are emphasized to a greater degree than in a minimum mean square error quantizer design. A large prediction error threshold quantizer is used alone and in conjunction with a small prediction error delta modulator to yield high quality reconstructions at compression ratios of 4:1 to 5:1. Smoothing of SAR data, while increasing redundancy, does not lead to better compression ratios when the predictive coding methods described are applied. (Edited author abstract) 9 refs.

Werness, Susan A.S. (Environmental Research Inst of Michigan, Ann Arbor, MI, USA). *Opt Eng* v 26 n 12 Dec 1987 p 1210-1218.

**087629 IMPROVING THE RESOLUTION OF SYNTHESIZED-APERTURE RADAR.** Synthesized-aperture radar (SAR) systems are widely used in investigating natural resources, in terrestrial and planetary cartography, in observation of ocean surfaces, etc. We consider two problems: (1) synthesis and investigation of an optimal algorithm for processing of the signal from a distributed target in an SAR system; (2) comparison of such an algorithm with known algorithms on the basis of resolution. We shall assume that the observed data take the form of a set of statistically independent vectors  $Y_i$  ( $i=1, L$ ), each made up of  $M$  samples of the observed data

at individual points of the SAR trajectory segment with length  $L_{EF}$ . 5 refs.

Doronskii, L.G. *Radioelectron Commun Syst* v 30 n 9 1987 p 94-96.

**087630 FILTER FOR REDUCING SPECKLE OF SYNTHETIC-APERTURE RADAR IMAGERY.** A nonlinear filter is proposed for reducing speckles in synthetic-aperture radar imagery. Basically, the filtering is performed by averaging; when a window includes an edge, pixels in the window are grouped into two according to their power level, and the mean power of the majority group is regarded as the power of the central pixel. This filtering is operated effectively when it is repeated two or more times with a small window, and gives a better result for preserving edges and smoothing in uniform region than the spatial average filter, the median filter, the adaptive filter, and the SSIR. (Author abstract) 10 refs.

**087631 AZIMUTH DEPOLARIZATION AMBIGUITIES IN SYNTHETIC APERTURE RADAR.** The effects of target depolarization in measurements made by stationary microwave systems have been extensively investigated. The use of depolarized measurements can provide information not available in the like-polarized measurement alone. Depolarized measurements acquired by non-Doppler systems were susceptible to errors induced by the measurement antenna. We extend this previous research to non-stationary (Doppler) systems. (Author abstract) 10 refs.

Lukert, D.H. (Univ of Texas at Arlington, Arlington, TX, USA); Blanchard, A.J. *Int J Remote Sens* v 9 n 3 Mar 1988 p 527-542.

**087632 SAMPLING EFFECTS IN SQUARE-LAW DETECTED SYNTHETIC APERTURE RADAR.** An earlier letter demonstrated that a narrow synthetic radar beam may be generated from square-law detected radar pulses provided the return pulse is incoherent. This technique would have the advantage of reducing the required knowledge of the platform location to a fraction of the transmitted pulse length, rather than the fraction of the carrier wavelength required by a coherent synthetic aperture radar. The effect of sampling the aperture is now described, and it is shown that the sampling interval required to avoid unacceptable sidelobe levels can be greater than that required by coherent synthetic aperture radar. (Edited author abstract) 2 refs.

**087633 NEW AUTOMATIC TECHNIQUES FOR SMOOTHING AND SEGMENTING SAR IMAGES.** A new algorithm for smoothing synthetic aperture radar (SAR) images, which is based on the estimation of the most homogeneous neighbourhood around each image pixel, is presented. The algorithm preserves fine details while removing noise along edges as well as in flat areas. An edge detection technique, based on the smoothing algorithm, is presented. The algorithms are implemented in the spatial domain, and without the need to use a threshold value. The performances of the algorithms are compared (qualitatively and quantitatively) with several standard techniques, using real and simulated images. (Edited author abstract) 15 refs.

**087634 ADAPTIVE SPATIAL-TEMPORAL PROCESSING OF RADIO SIGNALS IN ANTENNA SYSTEMS WITH A SYNTHESIZED APERTURE.** Aperture-synthesis methods are now widely used to increase the resolution of radar systems. Studies of the characteristic features of coherent processing of received signals in such systems have been performed before, but the prob-

lems arising in the use of adaptive antennas with a synthesized aperture have not been studied. The authors examine the principle of aperture synthesis as it applies to a radio link between a station on earth and an aircraft. 10 refs.

**087635 REMOVAL OF AZIMUTH DISTORTION IN SYNTHETIC APERTURE RADAR IMAGES.** The sources of distortion in Synthetic Aperture Radar (SAR) imagery are discussed. The Royal Signals and Radar Establishment airborne SAR system is described briefly and a phase correction scheme, based on autofocus measurement, to remove azimuth distortions is derived with the requirements for accuracy and update frequency of autofocus measurements. Examples of the application of the techniques to real SAR data are given. (Author abstract). 6 Refs.

Wood, J.W. (Royal Signal & Radar Establishment, Malvern, Engl). *Int J Remote Sens* v 9 n 6 Jun 1988 p 1097-1107.

**087636 DETECTION OF BURIED PLANT.** A wide-band microwave holographic method for imaging buried objects with high azimuth and range resolution is described. The method incorporates a synthetic aperture approach in pulse radar systems, originally designed for pulse-echo imaging, to improve azimuth resolution. The resolving capability of the method is discussed in terms of controlling parameters such as the synthetic aperture length, soil conductivity and dielectric constant, and antenna beamwidth. Since the propagation velocity of electromagnetic waves in soil, which varies from soil to soil, is an essential parameter for reconstructing object images by the method, a method of minimum squared error estimation of the propagation velocity from a pulse-echo image is proposed. Results of underground object image reconstruction from real pulse-echo data is reported to demonstrate high estimation accuracy of the propagation velocity and fine resolution of the reconstructed image. (Author abstract). 11 Refs.

**087637 SAR DATA FILTERING FOR CLASSIFICATION.** The authors compare several filtering techniques to improve the classification of a synthetic-aperture (SAR) image. They separate thematic information and noise by speckle analysis, and they propose filters adapted to speckle models. The evaluation includes a brief theoretical analysis, a visual interpretation, a signal-to-noise ratio analysis, and a comparison of required computer times, as well as classification results. The study also shows the effect of active microwaves on crop identification in the case where there is a one-date one-look SAR image, the utilization of X-band and C-band, and HH polarization. 20 refs.

**087638 EVALUATING ROUGHNESS MODELS OF RADAR BACKSCATTER.** A unique set of data collected for a soil moisture experiment has been used to evaluate three radar backscatter roughness models. The data were collected by the NASA space shuttle flight 41G (SIR-B) synthetic-aperture radar (SAR) in an intensively farmed area near Fresno, California. The SIR-B data swath included a large number of bare dry fields with a large variety of surface roughnesses. The small perturbation model gave the best results, particularly when fields with a definite periodic row structure were omitted. The standard deviation of surface heights appears to be a good measure of relative roughness conditions, but the correlation length did not appear to be a good descriptor of the surface nor did it seem to be related in any way to the measured backscatter. 5 refs.

**087640 ERS-1 SYNTHETIC APERTURE RADAR FAST DELIVERY PROCESSOR.** The ESA ground station facility at Kiruna, Sweden will be responsible for the reception of ERS-1 data and its processing into fast delivery products. Due to its high latitude, Kiruna can receive data from 10 of 14 passes per day, making its processing throughput requirements among the highest in the ERS-1 network. A discussion is presented of the SAR processor system at Kiruna responsible for part of this product generation. A description of the ground station environment is presented as the context in which the processor must operate. The processor requirements are then discussed followed by descriptions of the hardware and software components. 2 refs.

George, Peter (Dettwiler & Associates Ltd, BC, Can); Guignard, Jean-Pierre. *IEEE Trans Geosci Remote Sens* v GE-25 n 6 Nov 1987, 1986 Int Geosci and Remote Sens Symp (IGARSS'86) - Remote Sens - Today's Solutions for Tomorrow's Inf Needs, Zurich, Switz, Sep 8-11 1986 p 770-774.

**087641 PREDICTION OF GEOMETRIC DISTORTIONS IN AIRBORNE SYNTHETIC APERTURE RADAR IMAGERY FROM AUTOFOCUS MEASUREMENTS.** The synthetic aperture radar (SAR) is an imaging system that achieves high azimuthal resolution by tracking individual point scatterers using their phase histories, with the expected phase history of a particular point scatterer being derived from the assumed motion of the airborne SAR platform. The aircraft carrying the SAR will be susceptible to extraneous across track motions and errors in the pulse spacing. The image will be defocused due to an error in the expected quadratic phase history, and the image will contain geometric distortions due to an error in the linear phase history. An autofocus technique can be used to focus the image and produce a measure of the quadratic phase error that in turn can be used to estimate the geometric distortions that will be present in the final image. These distortions can be independently measured by direct comparison with a map of the imaged area. A description is given of the application of these methods to some real SAR data and the results of the comparison of the measurements of autofocus and geometric distortions are discussed in terms of both the likely platform motions present and the viability of predicting geometric distortion using the autofocus measurements. 6 refs.

**087642 RECONSIDERATION OF AZIMUTH AMBIGUITIES IN SAR.** The traditional method of specifying and controlling azimuth ambiguities in synthetic-aperture radar (SAR) is through integrated energy balance measures. However, the most frequently observed azimuth ambiguities arise from ensembles of strong point reflectors in the principal sidelobe of the antenna which in turn are aliased into the processed Doppler bandwidth by the radar pulse repetition frequency (PRF). The authors consider the dependence of these ambiguities on radar wavelength and PRF. It is shown that such ambiguous image elements are strengthened in proportion to  $\lambda^{-2}$ , and  $\text{PRF}^{-1}$ . The theoretical structure is based on orbital SAR geometry, including Earth rotation. The work is applied to a SIR-B L-band radar scene in which azimuth ambiguities are clearly observed. The level and spatial position of these ambiguities are measured in the digital image. The results are extrapolated to higher frequency radars such as ERS-1 and Radarsat. It is concluded that for these C-band radars the point azimuth restraint is more relevant (and more binding) than the traditional energy balance method. 3 refs.

Raney, R. Keith (Canada Cent for Remote Sensing, Ottawa, Ont, Can); Princz, G. Julius. *IEEE Trans Geosci Remote Sens* v GE-25 n 6 Nov 1987, 1986 Int Geosci and Remote Sens Symp (IGARSS'86) - Remote Sens - Today's Solutions for Tomorrow's Inf Needs, Zurich, Switz, Sep 8-11 1986 p 783-787.

**087643 MOTION-COMPENSATED SAR IMAGE ISLR.** The integrated sidelobe ratio (ISLR) arising from errors in motion compensation is a critical figure-of-merit in evaluating the fidelity of modern synthetic-aperture radar (SAR) imagery. An analytical closed-form expression is derived here as a function of SAR array time, underlying motion-sensor accuracy, and limiting data bandwidth. 13 refs.

**087644 NEW LOOK AT NONSEPARABLE SYNTHETIC APERTURE RADAR PROCESSING.** The author examines the nonseparable, template correlation approach to digital-strip-mode synthetic-aperture radar (SAR) phase history processing and concludes that it can now outperform the traditional separable approaches in the areas of speed, image quality, control simplicity, and flexibility. A working nonseparable frequency-domain SAR processor is described and evaluated. The image quality is seen to be superior to that resulting from the separable approaches. Based on the working intermediate hardware implementation, the author strongly suggests that future VHSIC and other advanced implementation will provide extremely fast (real time), high-quality, small, flexible SAR processors. 22 refs.

Di Cenzo, Alan (TRW, Redondo Beach, CA, USA). *IEEE Trans Aerosp Electron Syst* v 24 n 3 May 1988 p 218-223.

**087645 STRIP MODE PROCESSING OF SPOT-LIGHT APERTURE RADAR DATA.** The author shows how to process deramped (e.g., typical spotlight mode) synthetic-aperture-radar (SAR) data using mode processors, with no restrictions on antenna pointing. The basis of the approach is that although the deramped data does not contain a spatially invariant two-dimensional response to a point target, the range-compressed deramped data does. Range compression of the deramped data is performed simply by Fourier transforming each range line.

The method greatly increases the flexibility of current strip mode processors by extending their domain to a previously unsuitable class of data. 11 refs.

Di Cenzo, Alan (TRW, Redondo Beach, CA, USA). *IEEE Trans Aerosp Electron Syst* v 24 n 3 May 1988 p 225-230.

**087646 PHASE IMAGING BY REAL-ZERO CONVERSION AND ITS APPLICATION TO SYNTHETIC APERTURE RADAR.** A new method for generating an image of the unwrapped phase is discussed which is based on real-zero conversion of the data. The images produced by this method are of value in reducing the effects of clutter and identifying strong scatterers. (Author abstract) 8 refs.

**Tracking** See Also AEROSPACE VEHICLE TRACKING—Mathematical Models; DIRECTION FINDING SYSTEMS—Mathematical Models; INFORMATION THEORY—Correlation Theory; SIGNAL FILTERING AND PREDICTION—Mathematical Models; SIGNAL PROCESSING—Mathematical Models.

**087647 PROPERTIES OF A TRACKING FILTER WITH MANOEUVRING RADAR TARGET POSITION AND VELOCITY INPUTS.** If a radar has the ability to measure target velocity with high accuracy, it is advantageous to use these measurements to obtain more accurate estimates of the filtered position and velocity of a tracked radar target. Some properties of the Kalman optimum filter with measurement of target position and velocity are analyzed as is the possibility to suppress simultaneously the systematic error of target maneuver tracking and the position-measurement random noise. (Edited author abstract) 9 refs.

Lanka, Oldrich (Research Inst of Radio Engineering, Czech). *Tesla Electron* v 18 n 4 1985 p 117-124.

**087648 LOW-ANGLE TRACKING RADARS AND NON-LINEAR TIME-DELAY ESTIMATION.** A new approach, based on nonlinear time-delay estimation, is described for estimating the elevation angle in the combined presence of specular multipath and receiver noise—a situation that is encountered in the low-angle tracking radar environment. Estimation of the elevation angle is accomplished using the time delay between the signals impinging on the antenna array elements. Thus, the accuracy in the elevation angle estimation is dependent on the accuracy of the time-delay estimation algorithm. The formulation of the problem enables one to find the desired estimates independently of the reflection coefficient, which is a significant result. In the proposed approach, a newly derived non-linear filter due to the author is used. (Edited author abstract) 13 refs.

Abutaleb, Ahmed S. (Temple Univ, Philadelphia, PA, USA). *Int J Syst Sci* v 18 n 11 Nov 1987 p 2183-2196.

**087649 STATE ESTIMATION OF MANOEUVRING TARGETS FROM NOISY RADAR MEASUREMENTS.** Analytical results for tracking manoeuvring targets from noisy radar measurements are presented. A three-dimensional mathematical model based on Kalman filtering is discussed for the tracking of a manoeuvring aircraft using noisy measurements obtained from a three-dimensional radar. The measurement uncertainties and the manoeuvre characteristics are assumed to be known in polar coordinates, and are also assumed to be white Gaussian with zero mean and constant variance. These are coupled to the cartesian coordinate system selected for tracking operation. The elements of the covariance and Kalman gain matrices are expressed in terms of those which apply for tracking in polar coordinates. The steady-state results are expressed in compact form by appropriately partitioning the covariance matrices. The numerical computations of the steady-state filter parameters of the model agree with those obtained from the recursive Kalman filter matrix equations. Hence these results are of practical interest in developing trackers for

tracking manoeuvring aircraft and to eliminate the real-time execution of the complete filter equations. (Edited author abstract) 10 refs.

**087650 ANALYSIS OF NEAR-ZONE TARGET SCATTERING.** Some methods of analysing the scattering of airborne target are discussed. It is explained that the method of Geometrical Theory of Diffraction is suitable for the near-zone problems (when the distance from the target is comparable to the size of the target). The scatter field of a missile model is analysed and calculated applying Geometrical Theory of Diffraction. Under conditions of satisfying practical precision in engineering, the analysis is simplified by the main ray method. Making use of the geometric relations, the location of the rays is accurate and time-saving. The comparison of the calculated results with the experimental data shows the effectiveness of GTD in analysing target scattering. (Author abstract) 5 refs. In Chinese.

**087651 SUBOPTIMAL FILTER DESIGN WITH PSEUDOMEASUREMENTS FOR TARGET TRACKING.** A suboptimal Kalman filter design method is presented for the problem of tracking a manoeuvring target. The design method is essentially based on linear target dynamics and linear-like structured measurements called pseudomeasurements. The pseudomeasurements are obtained by manipulating the original nonlinear measurements algebraically. The resulting filter has computational advantages over other filters with similar performance. Also, a variant of the Berg model is proposed as a target acceleration model under the assumption of a coordinated turn maneuver. The proposed model is consistent with the underlying assumption. Monte Carlo computer simulation results are included to demonstrate the effectiveness of the proposed suboptimal filter associated with the target acceleration model. 10 refs.

**087652 NTH-ORDER DYNAMICS TARGET OBSERVABILITY FROM ANGLE MEASUREMENTS.** Necessary and sufficient conditions are presented for the observability of the target's Nth-order dynamics, given direction measurements. The derivations are extremely simple and do not require the examination of an observability matrix or nonlinear differential equations. Previously published observability requirements for the first-order dynamics are shown to be necessary but not sufficient. 2 refs.

Fogel, Eli (Tadiran Ltd, Holon, Isr); Gavish, Motti. *IEEE Trans Aerosp Electron Syst* v 24 n 3 May 1988 p 305-308.

**087653 TRACKING MULTIPLE TARGETS WITH CORRELATED MEASUREMENTS AND MANEUVERS.** The problem of tracking N targets with correlation in both measurement and maneuver statistics is solved by transforming to a coordinate frame in which the N targets are decoupled. For the case of N identical targets, the decoupling is shown to coincide with a transformation to a set of nested center-of-mass coordinates. Absolute and differential tracking accuracies are compared with suboptimal results to show the improvement that is achieved by properly exploiting the correlation between targets. 7 refs.

## RADAR CIRCUITS

**087655 COMPARISON OF THE PERFORMANCE CHARACTERISTICS OF DOPPLER SHORT-RANGE SYSTEMS.** The following three schemes for designing Doppler short-range systems are compared: a system using an autodyne, where high-amplitude oscillations are generated and a small reflected signal is converted and amplified; a scheme in which generation and amplification are carried out in one unit and conversion occurs in a separate converter; and a scheme in which the oscillator and converter are coupled by a circulator, and the signal is not amplified. It is shown that the autodyne amplification in the second scheme is cancelled out by coupling losses and therefore has no advantage over the third scheme. (Edited author abstract) 7 refs.

## Analysis

**087657 LINEAR FM CHIRP FILTERS IN PULSE COMPRESSION RADARS.** Using a complex Fresnel integral algorithm, the authors extend results of other authors from a time-bandwidth product of 50 up to 720. They analyze a rectangular linear FM filter having a 300-MHz center frequency, 120-MHz bandwidth, and 6-μs dispersion time T. Two different methods of rectangular FM cosine square tapering are compared. In the first method, the tapers are of length T/12 at the two edges inside the dispersion time T, while in the second, tapers of length αT are added to the duration T (α = 0.05 and 0.1). The results show that the skirt steepness, the sidelobe rejection, and the Gibbs ripples of the wave spectrum, as well as the reduction of insertion loss and the suppression of Fresnel ripples, are best at α = 0.1. 9 refs.

## Microwaves

**087658 ANALYSIS SHOWS EFFECTS OF AGING ON T/R MODULES.** Advantages of solid-state phased-array apertures are well documented. Development of this technology, in particular transmit/receive (T/R) modules, is advancing rapidly. This article discusses an investigation that took place to determine the effects of aging on a set of X-band T/R radar modules. Tests were conducted with one of the first active-aperture X-band radar T/R modules using hybrid microwave integrated circuits. These circuits rely on GaAs FETs for power amplification, and were developed to provide a reproducible and reliable T/R module that satisfies the requirements of operation in a multimode active-array radar. 5 refs.

**087660 STATISTICAL PROPERTIES OF RADAR IMAGES OF FLUCTUATING UNDERLYING SURFACES.** The process of the formation of radar images (RI) of fluctuating surface-distributed objects in radar sets with synthesized aperture is analyzed. Analytic expressions are obtained which describe the main statistical properties of such RIs and the degree of their smoothness in the case of incoherent storage of signals. It is shown that the statistical characteristics of RIs are invariant with respect to the magnitude of the correlation interval of the time fluctuations in the echo signal and the signal-to-noise ratio on RIs is practically independent of the degree of incoherent signal storage. (Author abstract) 9 refs.

**087663 SHUTTLE IMAGING RADAR A ANALY-**

**SIS OF LAND USE IN AMAZONIA.** We have made a comparison of data from Landsat multispectral scanner (MSS) and from the Shuttle Imaging Radar (SIR-A) L band HH polarization data for sites in the Amazon Basin. Results indicate that SIR-A backscatter from the undisturbed forest was lower than that from some disturbed areas and from flooded forests and that SIR-A brightness increases nonlinearly with the Landsat normalized difference vegetation index (NDVI). We hypothesize that the brightest radar returns in southern Amazonia are from newly cleared forests that are littered with standing and fallen tree boles that function as corner reflectors, and that backscatter will diminish from disturbed areas over time as fields are burned repeatedly. (Edited author abstract) 34 refs.

Stone, Thomas A. (US Marine Biological Lab, Woods Hole, MA, USA); Woodwell, George M. *Int J Remote Sens* v 9 n 1 Jan 1988 p 95-105.

**087664 ATMOSPHERIC CORRECTION OF THERMAL INFRARED IMAGES.** A method for estimating sea surface temperature (SST) from a single infrared (IR) channel together with an atmospheric model is investigated. Based on a simulated atmospheric height profile, the precipitable water and transmittance can be calculated as a function of height from the known atmospheric pressure, temperature and relative humidity on the ground. An effective transmittance (which is the ratio of the radiance at the satellite to that on the surface) is used to correct the effect of off-nadir scanner angle. Various data from the Heat Capacity Mapping Mission (HCMM), the Advanced Very High Resolution Radiometer (AVHRR) and other sources are used to evaluate the accuracy of the method. The SST derived agrees with available ground truth with a root mean square (r.m.s.) error of about 1 deg K. (Edited author abstract) 20 refs.

**087665 ACQUISITION OF SPOT-1 HRV IMAGERY OVER SOUTHERN BRITAIN AND NORTHERN FRANCE, MAY 1986-MAY 1987.** The number and spatial distribution of SPOT-1 HRV images acquired over northern France and southern Britain during the first commercial year of the SPOT satellite system (officially 6 May 1986-6 May 1987) have been evaluated in response to concern about the lack of cloud-free imagery. The results confirm that despite large numbers of images being acquired per scene (1 panchromatic and 12 multispectral on average over northern France; 8 panchromatic and 12 multispectral over southern Britain) most are of limited use because of cloud cover. Only 30 per cent of the images collected (or 5 images/scene/year) have at least one quadrant with <25 per cent cloud cover and 10 per cent (or 2 images/scene/year) have <10 per cent cloud cover in each quadrant. (Edited author abstract) 4 refs.

**087666 BAYESIAN CLASSIFICATION OF SURFACE-BASED ICE-RADAR IMAGES.** The Bayes classification procedure has been used to discriminate types of sea ice based on images obtained from surface-based marine radars. The data sets were digitized images obtained from a dual-polarized Ku-band radar (16 GHz) and a like-polarized S-band radar (3 GHz) at a site located on the northern tip of Baffin Island, Canada. The images were range-compensated, and statistical properties of different ice types were determined. The observed histograms for different ice types were approximated by continuous density functions. The images were classified by maximizing the a posteriori probabilities obtained from Bayes' rule. The results suggest that there is sufficient information in the reflectivity to classify the different forms of ice using decision-theoretic pattern recognition techniques. 15 refs.

## Applications

**087667 FMCW RADAR FOR HIDDEN OBJECT DETECTION.** The use of FMCW radar for the detection of hidden objects at short distances is described. The factors which influence the type of radar and the optimum parameters for FMCW radar are discussed. It is shown that FMCW radar is satisfactory for situations where a high resolution is needed at a short distance, such as the detection of flaws in building materials. Practical systems are described. Both FFT and non-Fourier methods are used for processing the radar returns. Multiple targets hidden in media can be revealed by digital subtraction or template matching using a numerical optimization procedure. The radar is shown to be capable of producing images of targets. (Edited author abstract). 19 Refs.

## Computer Aided Analysis

**087668 RADIOMETRIC CORRECTION OF C-BAND IMAGERY FOR TOPOGRAPHIC EFFECTS IN REGIONS OF MODERATE RELIEF.** The combined effects of topography, slope, look angle, and aspect on C-band synthetic-aperture radar (SAR) data on the radiometric quality of SAR images in a region of moderate relief are examined. A correction method was used to attenuate the change of illumination across the swath due to the antenna pattern. Ground data were integrated into the analysis using a digital terrain model (DTM). Correction functions based on the cosine of the incidence angle were applied to the thematic classes and to the grouped classes in order to reduce the effects related to topography. It was found that it is possible to eliminate part of the radiometric variations created by moderate topographic relief. After the corrections were applied, a reduction was noted of the variance in the radiometric values of the spectral signatures of the cover types, which ranged between 3.03% and 9.47%, depending on the correction function used. No noticeable correction occurred of pixels with slopes less than 6° and at local incident angles less than 26°. However, the closer the slopes are to being perpendicular to the look direction, the stronger is the correlation between backscatter and slope angle. 17 refs.

Processing See RADAR—Synthetic Aperture.

Spectrum Analysis See Also RADAR—Cross Sections.

**087670 SPECTRAL PROPERTIES OF HOMOGENEOUS AND NONHOMOGENEOUS RADAR IMAGES.** Based on a two-dimensional, nonstationary white noise model for complex radar backscatter, the spectral properties of a one-look synthetic-aperture radar (SAR) system are derived. It is shown that the power spectrum of the complex SAR image is scene independent. It is also shown that the spectrum of the intensity image is in general related to the radar scene spectrum by a linear integral equation, a Fredholm's integral equation of the third kind. Under simplifying assumptions, a closed-form

equation giving the radar scene spectrum as a function of the SAR image spectrum can be derived. 13 refs.

**087672 SPACE-TIME CORRELATION FUNCTION OF INTERFERING REFLECTIONS OF A RADAR SIGNAL.** The space-time correlation function is obtained for noise caused by reflection of a radar signal from the underlying surface at small angles of elevation. An expression is obtained for this function in closed form with minor constraints as a result of an analytic treatment. Allowance is made for the parameters of the underlying surface, the geometric characteristics of the receiving system, the width of the illumination radiation pattern, and the amplitude-phase modulation of the signal radiated. It is shown that the correlation function is separated (factored) into space and time functions. (Author abstract) 4 refs.

**Clutter** See Also RADAR—Surveillance Application; RADAR RECEIVERS—Analysis.

**087674 SPATIAL CORRELATION IN K-DISTRIBUTED SEA CLUTTER.** The compound K-distribution model for sea clutter previously described in the literature provides the foundation for a quantitative treatment of the spatial and temporal correlation characteristics of the envelope of clutter returns. In the paper the compound K-distribution model is extended to cover the spatial characteristics of sea clutter. The relationship of these characteristics to the physical basis of the model is described, and methods for their simulation are discussed. The effects of different radar range resolutions are analyzed and these results compared with observations on real data. Quantitative techniques are derived for optimizing radar range resolution to give the best target detection performance in different clutter conditions, and some practical examples are presented. (Edited author abstract) 12 refs.

Watts, S. (Thorn EMI Electronics Ltd, Hayes, Engl); Ward, K.D. *IEE Proc Part F* v 134 n 6 Oct 1987 p 526-532.

**087675 ASYMPTOTICALLY OPTIMUM RADAR DETECTORS IN NON-RAYLEIGH CLUTTER.** The paper deals with the synthesis of the coherent asymptotically optimum detector (AOD) for fluctuating targets embedded in non-Rayleigh clutter. For the proposed detection scheme the asymptotic (large sample size) performance is evaluated. Comparison with the linear detector shows that, in principle, significant improvements are achievable by resorting to the AOD if the sample size is arbitrarily large. Since in radar system design the sample size is dictated by technological limits, the paper also investigates by computer simulation the performance of the AOD under such constraints. It turns out that the promises of the asymptotic theory cannot be achieved using moderately large sample sizes. A simple hybrid detection scheme is proposed that performs better than both the asymptotically optimum and the linear detectors in actual operational situations. (Edited author abstract) 13 refs.

**087677 CLUTTER ELIMINATION AND FEATURE ENHANCEMENT IN MULTIPOLARIZATION RADAR IMAGING AN INVARIATION APPROACH.** Multipolarization radar systems determine the scattering matrix associated with each element of the image to be constructed. Ways in which this information can be used to enhance radar images are reviewed, either by suppressing background noise or by enhancing features with known polarization signature. An imaging quantity designed to facilitate the recognition of such signatures is proposed. The elegance and convenience which can be achieved by concentrating on the eigenvectors and eigenvalues of the scattering matrix are emphasized. (Author abstract) 12 Refs.

Jackson, J.C. (Oxford Computer Services Ltd, Oxford, Engl). *Int J Remote Sens* v 9 n 8 Aug 1988 p 1399-1403.

**087678 PREDICTING CLUTTER DURING ANOMALOUS PROPAGATION CONDITIONS.** Excessive clutter caused by anomalous propagation conditions severely degrades radar performance in many regions of the world. This article describes methods that can be used to predict anomalous clutter amplitude for site-specific radar parameters, terrain features, and atmospheric conditions and to predict the effects of radar Doppler processing on evaporation-ducted sea clutter. (Author abstract) 11 Refs.

Lee, Susan C. (Johns Hopkins Univ Applied Physics Lab, Laurel, MD, USA); Maurer, Donald E.; Musser, Keith L. *Johns Hopkins APL Tech Dig* v 9 n 2 Apr-Jun 1988 p 101-109.

**087679 NUMERICALLY EFFICIENT CALCULATIONS OF CLUTTER MAP CFAR PERFORMANCE.** An alternative expression is derived for the false alarm probability of clutter map constant false alarm rate (CFAR), that was originally presented by R. Nitzberg (1966). The proposed expression converges more rapidly because the infinite product in the original expression is expressed instead as an infinite sum of products. 1 ref.

**087680 CLUTTER SUPPRESSION USING RECURSIVE AND NONRECURSIVE MTI FILTERS.** The

author calculates the effectiveness of clutter suppression of a moving-target-indicator (MTI) filter in tandem with a fast-Fourier-transform (FFT) Doppler filter bank, taking into account the transient response of the MTI filter. Both recursive and nonrecursive filters are considered. The analysis is extended to the high-pulse-repetition-frequency (PRF) case with clutter fold over. The results can be used to select key design parameters, including the MTI filter, the window size, and the initial transient segment to be discarded. Numerical examples are included. 4 refs.

Liu, Bede (Princeton Univ, Princeton, NJ, USA). *IEEE Trans Aerosp Electron Syst* v 24 n 3 May 1988 p 210-217.

**087681 NEW RESULTS ON LINEAR PREDICTION FOR CLUTTER CANCELLATION.** Some moving-target indicator (MTI) techniques are reviewed and those based on the linear prediction theory are examined. A description is given of the effects of the position of the reference sample in an MTI processor on cancelling clutter in a radar system. The analysis of this generalized linear prediction MTI is based on the evaluation of the receiving operating characteristics (ROCs), assuming that the clutter covariance matrix is known a priori as well as the matrix being estimated on line. It is shown by analytical evaluations and Monte Carlo simulations, that the performance is generally insensitive to the position of the reference sample. An additional analysis is carried out to compare the performance of the generalized linear prediction MTI with the MTI based on the Hsiao approach. It is seen that with the formation of the interference of two superimposed clutter sources the generalized linear prediction MTI suffers, in some cases, several decibels of loss. 11 refs.

#### Infrared Radiation

**087685 EXPLORING THE RELATIONSHIPS BETWEEN LEAF NITROGEN CONTENT, BIOMASS AND THE NEAR-INFRARED/RED REFLECTANCE RATIO.** This paper presents the results of a pilot study that sought to explore the links between biomass, leaf 'kjeldahl' nitrogen red (R) and near-infrared (NIR) reflectance. It was observed that biomass was related to R and NIR reflectance and leaf kjeldahl nitrogen, but the variance in each relationship was high, despite taking into account leaf and soil moisture and site topography. It is proposed that much of the unexplained variance is due to different proportions of live, dead, erectophile and planophile biomass at each site. (Edited author abstract) 19 refs.

Plummer, S.E. (Univ of Sheffield, Sheffield, Engl). *Int J Remote Sens* v 9 n 1 Jan 1988 p 177-183.

#### Laser Applications

**087686 MONOSTATIC DOPPLER LIDAR BASED ON Nd:YAG LASER FOR MEASURING WIND VELOCITY.** A monostatic Doppler lidar based on a continuous Nd:YAG laser is developed for measuring the modulus of the wind velocity. At moderate levels of atmospheric turbulence, the limiting range of the measurements is 200 m. A series of atmospheric measurements is made. (Author abstract) 5 refs.

**087688 ALGORITHM FOR MEASURING A WIND VELOCITY COMPONENT BY A CORRELATION METHOD IN A PHOTON-COUNTING MODE AND ERROR OF THESE MEASUREMENTS.** An algorithm for determining the wind velocity by correlation LIDAR with signal recording in a photon-counting mode has been developed. A parabolic approximation of the

estimate of the correlation function by the method of least squares has been used. The measurement error which stems from fluctuations in the signals and noise in the receiving channel, in the transparency, and in the energy of the laser light has been analyzed. Simple approximate expressions have been found for estimating the measurement error. The workability of this new algorithm is illustrated through a numerical simulation of a correlation wind velocity gage. (Author abstract) 6 refs.

#### Synthetic Aperture

**087689 METHOD OF INSPECTION OF AN OPTICAL SYNTHETIC APERTURE RADAR PROCESSOR.** In this paper we take a general OSARP inspection as an example to explain the method of inspection of an OSARP. We relate the adjustable quantities of each adjustable assembly of the OSARP (Optical Synthetic Aperture Radar Processor) with each characteristic number of a SAR (Synthetic Aperture Radar) data film. The applicable range of the OSARP is obtained by testing the adjustable quantities. The imaging quality of the OSARP is inspected with the general testing targets and a shift lens. The advanced inspection of the OSARP is done with the simulated SAR data films. It is a different way, but the results are the same as the former. Finally, the SAR data film is processed to show the comprehensive imaging quality of the SAR and the OSARP. The experimental pictures and data presented in this paper are for reference only. The experimental results show that the method is applicable. (Author abstract) 7 refs. In Chinese.

#### Testing

**087690 AIRBORNE LIDAR EXPERIMENTS AT THE SAVANNAH RIVER PLANT - JUNE 1985.** The results of remote sensing experiments at the Department of Energy (DOE) Savannah River Nuclear Facility utilizing the NASA Airborne Oceanographic Lidar (AOL) are presented. The flights were conducted in support of the numerous environmental monitoring requirements associated with the operation of the facility and for the purpose of furthering research and development of airborne lidar technology. Areas of application include airborne laser topographic mapping, hydrologic studies using fluorescent tracer dye, timber volume estimation, baseline characterization of wetlands, and aquatic chlorophyll and photopigment measurements. Conclusions relative to the usability of airborne lidar technology for the DOE for each of these remote sensing applications are discussed. (Author abstract) 16 refs.

#### Analysis

**087691 PERFORMANCE ANALYSIS OF CA-CFAR IN THE PRESENCE OF COMPOUND GAUSSIAN CLUTTER.** Exact expressions are derived for the (ROCs) of a CA-CFAR radar processor subject to both internal noise and clutter (the last one modelled as compound Gaussian). They include previously known ROCs, e.g. for ideal CFAR. The effect of finite sample size is elicited in the example of K-distributed clutter. (Edited author abstract) 4 refs.

**087692 ITERATIVE METHOD FOR RANGE SIDELobe SUPPRESSION FOR BINARY CODES.**

Binary phase coded waveforms are widely used in modern radar systems. In linear receivers the sidelobes present at the output of the compression filter cause a reduction of the useful dynamic range. The method presented is an iterative process where the process of inversion is repeated a number of times to reduce the output sidelobes. (Edited author abstract) 7 refs.

#### Measurements

**087693 OBJECTIVE MEASUREMENT OF RECEIVER SENSITIVITY.** The sensitivity of radar receivers is checked with a pulsed radio frequency signal which is adjusted until the observed magnitude is distinguishable from the background noise level as displayed on an oscilloscope. Because of the noisy nature of the display the results are highly subjective, but by eliminating the idiosyncratic element, a calibration instrument has been designed to give a rapid and accurate presentation to the operator. (Author abstract) 3 refs.

#### Noise, Spurious Signal

**087694 INFLUENCE OF RECEIVER CROSS-MODULATION ON ATTAINABLE HF RADAR DYNAMIC RANGE.** The performance of an HF radar system should ideally be limited by environmental factors as opposed to instrumental limitations. In this study the influence of one such limitation, receiver cross-modulation, is quantitatively assessed. An expression is derived for the attainable dynamic range, relating it to the receiver's linearity and the signal environment in which it is required to operate. In common with cross-modulation experienced in other receiving systems, the dynamic range is independent of the strength of the desired signal. In the context of HF radar this means that should the system performance be limited by cross-modulation, any increase in signal and clutter levels achieved through increased radiated power will be accompanied by a corresponding increased noise floor. The system would remain internally noise-limited, and any potential increase in sensitivity would not be realized. 7 refs.

**Optimization See Also SIGNAL DETECTION—Optimization.**

**087695 SUBOPTIMUM ADAPTIVE POLARISATION CANCELLERS FOR DUAL-POLARISATION RADARS.** Some suboptimum adaptive polarisation techniques for the cancellation of partially polarised disturbances are analysed. They are based on suitable use of the estimates of the crosscorrelation between the dual-polarisation received signals. The performances of these techniques are evaluated and compared with that of the optimum setting of polarisation on reception. It is shown that the performances of the suboptimum techniques are affected by a quite limited cancellation loss, and related to the antenna polarisation basis used on reception. Some implementation aspects of these techniques are discussed. (Edited author abstract) 20 refs.

**087699 POLARIZATION PROCESSING OF SIGNALS IN MULTICHANNEL TRANSMITTING-AND-RECEIVING SYSTEMS.** In the analysis of multichannel transmitting-and-receiving systems for processing space-time signals, the possibility of increasing the information content by employing differences in the polarization structure of the signals and noise was not studied in most papers. At the same time, it is well known that during active detection the quality of the operation of the entire system can be improved by optimizing the polarization parameters of the sounding signal and the subsystem used for processing the received signal. The authors show that for certain ratios of the polarization parameters of the useful and noise signals, polarization processing enables one to suppress the noise from the external source effectively, even in the case when both the target and the interference source are located along close or identical spatial directions. 5 refs.

**Calibration**

**087701 USING THE SUN TO CHARACTERIZE RADAR SYSTEMS.** Solar electromagnetic radiation can be used as an external, calibration rf source for measuring radar-system performance parameters. A simply derived criterion will tell radar users if their system can be evaluated in this manner. Fortunately, this criterion is defined in terms of the parameters of the radar itself, and, therefore, is applicable to any radar system.

**087702 SIR-B IMAGE CALIBRATION BY A CORNER REFLECTOR ARRAY.** SIR-B image data taken over a corner reflector array are analyzed to calibrate the image and to estimate the 3 dB resolution. Square trihedral corner reflectors having different radar cross-sections (RCSs) are successfully used to relate an image data number to RCS. RCS of the background surface is estimated and its effect is also included in the above relation. The 3 dB resolutions are estimated by two independent techniques. The results obtained from the two techniques agree with each other within their relative difference by 5.6 percent except for one case. The estimated resolutions are larger than those predicted by the Jet Propulsion Laboratory. The estimates should be regarded as the image resolutions and do not represent the sensor characteristics. **Military Applications**

**087705 COMPUTERS IN AIR DEFENCE.** The advent of radar signified a major advance in air defense technology and techniques. Rather than depend on visual observation and the hazards and limitations thereof, it became possible with radar to detect the presence of flying objects at much greater distances. The PPI display of a conventional air-surveillance radar permits an operator to scan the sky for several hundreds of kilometers all around.

Early radar-based air defense systems were dependent on human observation and decision making for detecting targets, identifying them, deciding on interception strategy and for recovering the interceptor after completion of his mission. This was feasible because, with a radar range of between 200 to 400 kilometers and aircraft speeds in the range of 500 kilometers per hour, up to 30 minutes warning was available before the target was overhead. (Edited author abstract)

**087706 DESIGN AND PERFORMANCE OF A 215 GHz PULSED RADAR SYSTEM.** A high-power 215-GHz pulsed radar system developed for remote-sensing applications is described that is capable of making backscatter measurements from terrain targets at ranges of several kilometers under normal atmospheric conditions. By using separate transmit and receive antennas, the amplitudes of the polarization matrix elements may be measured conveniently. A dedicated data acquisition system was developed allowing up to 15 range gates to be sampled at 100-ns intervals. Instrument stability of  $\pm 1.0$  dB yields accurate scattering measurements of a variety of terrestrial targets. System performance and calibration, together with measurements of snow backscatter coefficients made during early 1987, are discussed. 10 refs.

**Optimization**

**087708 OPTIMIZING SPACE PROCESSING OF SIGNALS IN A TWO-POSITION RADAR SYSTEM.** The utilization of diversity radar systems broadens the possibilities for spatial selection of signals and interference. We consider such selection in application to a short-base radar system with the aim of increasing the snr in detection of signals from remote targets in a background of passive interference (PI) from nearby reflectors. The need for utilization of such selection arises when the probe-pulse repetition frequency is high,  $F > c/2R_M$  ( $R_M$  is the maximum detection range;  $c$  is the wave propagation velocity) owing to superposition of short-range PI on the signals of remote target, making it impossible to implement time selection. We consider a two-position radar system with base  $b < R_M$  in which scanning is carried out by synchronous rotation of the receiving (Rc) and transmitting (T) antennas at constant angular velocity  $\Omega$ . 2 refs.

## RADAR TRANSMITTERS

**087709 20 kW SOLID-STATE L-BAND TRANSMITTER FOR THE RAMP PSR RADAR.** A program known as the radar modernization project (RAMP) will replace all of Canada's primary and secondary surveillance radars used for air traffic control. Each of Canada's 22 major airports will have a terminal surveillance radar (TSR) site consisting of both primary (PSR) and secondary (SSR) surveillance radars. The use of L-band transmitters is discussed, covering the transmitter architecture, power amplifier modules, transistor device and circuits, and 1:14 divider/combiner. It is concluded that high-power solid-state transmitters at L band are realizable and competitive, offering improved performance, reliability, availability and maintainability compared to tube transmitters. As the cost of L-band transistor devices decreases and clever, cost-effective design techniques evolve, they can be expected to become even more competitive. 2 refs.

**087713 EFFECTS OF HEAT AND RADIATION ON MAMMALIAN CELLS.** The well known naturally occurring antioxidant systems (reduced glutathione, superoxide dismutase, catalase and glutathione peroxidase) are not found to act as the main protective systems of the cell against hyperthermic cell killing. Evidence is presented that it is not the lipids of the membrane, but probably the membrane proteins which are critical primary molecular targets for hyperthermia. The readily peroxidizable polyunsaturated fatty acyl (PUFA) chains of phospholipids may be target molecules for radiation damage leading to interphase death but not leading to reproductive death. Repair of radiation-induced DNA lesions is probably the critical event in cell survival after radiation. This process is inhibited by hyperthermia. The synergism observed as a consequence of the interaction of heat and radiation may not always be explained by the rate of repair of DNA breaks. Especially in the case of fractionated heat treatments (inducing a state of thermotolerance) the situation seems more complicated. Heat-induced inactivation of DNA repair enzymes as well as heat-induced structural changes in chromatin (enhanced protein binding) may be processes that become critical. Thermotolerance does not always interfere with the process of heat radiosensitization. (Edited author abstract) 72 refs.

Konings, A.W.T. (Univ of Groningen, Groningen, Neth). *Radiat Phys Chem* v 30 n 5-6 1987 p 339-349.

**087714 MEMBRANE STRUCTURE AND RADIATION AND HYPERTHERMIC DAMAGE.** The general structure of the biological membrane and its involvement in cell damage from radiation and hyperthermic insults are discussed using bacterial cells as an example. Bacterial cells are useful models for these types of studies because they possess a simple membrane system whose composition can be readily altered. Also, various strains exist having different sensitivities to radiation and heat. The cell membrane, particularly the lipid component, is an important target in hyperthermic cell killing. The composition and organization of the membrane lipids can influence a cell's response to heat. Heat-induced changes in membrane lipids lead to altered distribution of E. coli proteins, particularly their translocation to the outer membrane. These and other aspects are discussed in this review. (Edited author abstract) 178 refs.

**087715 PHYSICO-CHEMICAL BASIS OF RADIOSENSITIZATION BY IODINE COMPOUNDS.** In the field of biological radiation sensitization, iodine-containing sensitizers (ICS) can display various mechanisms of sensitization, namely biochemical, radiation-chemical and physical. A discussion in this regard includes the following topics: the historical background; the biochemical mechanisms of sensitization; the radiation chemical mechanism of sensitization (cell survival experiments, end points different from survival, and model and radiation chemical experiments); and sensitization through increase in absorbed dose. 68 refs.

Quintiliani, M. (CNR, Rome, Italy). *Radiat Phys Chem* v 30 n 5-6 1987 p 409-422.

**087716 MECHANISM OF RADIOSENSITIZATION BY ELECTRON-AFFINIC COMPOUNDS.** 'Electron-affinic' radiosensitizers generally mimic oxygen in modifying cellular radio-sensitivity, although not necessarily by the same molecular mechanisms. Useful mechanistic probes include quantitative relationships between chemical properties and efficacy, although the latter can usually be expressed only in terms of extracellular concentrations. The response vs concentration curves can also provide a test of a mechanistic model. Some possible mechanisms of radiosensitization are outlined: sensitization of damage from direct energy absorption; oxidation of radicals on the sugar/phosphate backbone of DNA;

oxidation of base radicals; and radiation-induced binding of radiosensitizers. Each model is approached from the viewpoint of the known redox relationships with radiosensitizers and competition with thiols which serve to reduce the effect. (Author abstract) 114 refs.

Wardman, Peter (Mount Vernon Hospital, Northwood, Engl). *Radiat Phys Chem* v 30 n 5-6 1987 P 423-432.

**087717 STOCHASTIC CALCULATIONS OF THE FAST DECAY OF THE HYDRATED ELECTRON IN THE PRESENCE OF SCAVENGERS - TESTS OF MODEL CONSISTENCY.** An excellent test of the efficacy of computer codes simulating the nanosecond diffusion and interaction of radiation-produced radicals is their ability to predict a broad range of data - for example time-dependent yields with and without scavengers. Using a Monte-Carlo transport code for the radiation-production of radicals in liquid water, together with a stochastic calculation of their interaction and decay, we investigate this point. Consistent use of these techniques yields, without adjustable parameters, the shape and absolute magnitude of the time decay of the hydrated electron in pure water, and also the measured time decay in the presence of both hydroxyl and hydrogen ion scavengers. (Author abstract) 33 refs.

Brenner, D.J. (Columbia Univ, New York, NY, USA). *Radiat Phys Chem* v 32 n 2 1988 p 157-162.

**087718 RADICAL-INDUCED OXIDATION OF GLUTATHIONE IN ALKALINE AQUEOUS SOLUTION.** The reactions of radicals of  $N_3$ ,  $CO_3^{•-}$ , and ROH with glutathione have been studied in basic aqueous solution. Whereas only the sulfur-centered GS radical is produced by the one-electron oxidants of the radicals of  $N_3$  and  $CO_3^{•-}$ , a strongly reducing radical is formed in pH-dependent yield by the radical of ROH and OH. The data are explained by pH-dependent conformational changes of glutathione on deprotonation of the amino and thiol groups. (Edited author abstract) 17 refs.

Eriksen, Trygve E. (Royal Inst of Technology, Stockholm, Sweden); Fransson, Gunilla. *Radiat Phys Chem* v 32 n 2 1988 p 163-167.

**087719 RADIATION-ENERGY PARTITION AMONG MIXTURE COMPONENTS: CURRENT IDEAS ON AN OLD QUESTION.** We review the basis of the familiar idea that the energy partitions among mixture components in the initial stage would be governed by the total electron fraction. For considerations of many problems in radiation chemistry, it is better to use the valence-electron fraction. We also point out recent developments in more detailed treatments, which indicate limitations of the very concept of the energy partition for the determination of the yields of initial molecular species that appear under irradiation. (Author abstract) 29 refs.

Swallow, A. John (Christie Hospital & Holt Radium Inst, Manchester, Engl); Inokuti, Mitio. *Radiat Phys Chem* v 32 n 2 1988 p 185-189.

**087720 RADIATION CHEMICAL AND MAGNETIC RESONANCE STUDIES OF AQUEOUS AGAROSE GELS CONTAINING FERROUS IONS.** Aqueous agarose gels containing ferrous ions sustain a radiolytic chain reaction, producing  $Fe^{3+}$ .  $G(Fe^{3+})$ -values up to 156 have been observed, independent of dose rate between 0.434 and 3.74 Gy  $min^{-1}$ . Dissolved oxygen is needed to maintain the chain reaction, and initial ferric yields are increased if the gel is oxygen saturated, or if the  $Fe^{2+}$  concentration is decreased. Longitudinal proton magnetic relaxation rates are increased in proportion to ferric production, permitting visualizing of dose levels in these gels by magnetic resonance imaging techniques. There is a potential for applications to radiation therapy treatment planning. (Author abstract) 7 refs.

**087721 APPLICATION OF RADIATION CHEMISTRY FOR CONSERVATION OF ARCHEOLOGICAL WATERLOGGED WOOD AND OSTEOLOGICAL OBJECTS.** The application of radiation chemistry to the conservation of archaeological objects is described. Methyl methacrylate is introduced into the voids of the objects to be conserved either by an exchange process or - if allowed by the mechanical strength of the object - by vacuum impregnation. It is neither necessary nor desirable to fill the object completely with the monomer that is subsequently polymerized with  $^{60}\text{Co}$   $\gamma$ -rays. (Author abstract) 24 refs.

Gaumann, Tino (ETH, Lausanne, Switz); Kowalski, Thomas S.; Menger, Andre. *Radiat Phys Chem* v 32 n 2 1988 p 275-280.

**087722 ESR STUDIES OF ION-MOLECULE REACTIONS OF ETHER, THIOETHER, AND OLEFIN RADICAL CATIONS IN THE  $\text{CF}_2\text{ClCFCl}_2$  MATRIX.** Several ion-molecule reactions of radical cations with their corresponding neutral molecules have been studied by ESR spectroscopy. The reactions were observed at low temperatures (80-130 K) in a mobile halocarbon matrix following the radiolytic generation of the radical cations from dilute solutions of the parent compound at 77 K. Although the end results of each reaction is the formation of a neutral radical, the mechanism can be formulated either as a proton transfer from the radical cation or as a hydrogen atom transfer from the neutral molecule, the reaction products being the same in each case. 51 refs.

Williams, Francon (Univ of Tennessee, Knoxville, TN, USA); Qin, Xue-Zhi. *Radiat Phys Chem* v 32 n 2 1988 p 299-308.

**087723 SODIUM-WATER CLUSTERS AND THEIR ROLE IN RADIATION CHEMISTRY.** Studies of sodium-water clusters are presented which could serve as models for the recently suggested intermediate species in the radiation chemistry of water. The ionization potentials and the lower excited states of sodium with  $n$ -water molecules are calculated by ab initio quantum chemistry methods. The ionization potential calculated at the SCF level for the water monomer is 4.10 eV, which becomes 4.34 at the MP2 correlation level. The experimental value is 4.379 $\pm$ 0.002 eV. Structural data is presented for the lower members of the sodium with  $n$ -water clusters. In addition the Hartree-Fock calculations indicate that there should be some strong charge transfer to solvent transitions at higher energies. (Author abstract). 19 Refs.

Dhar, S. (Louisiana State Univ, Baton Rouge, LA, USA); Kestner, Neil R. *Radiat Phys Chem* v 32 n 3 1988 p 355-360.

**087724 GAS-PHASE AND SOLUTION MECHANISM OF THE ISOTOPE EXCHANGE REACTION  $\text{OH}^- + \text{D}_2 = \text{OD}^- + \text{HD}$ : BEAM STUDY OF THE SOLVATED-ION REACTION  $\text{OH}^- \cdot \text{H}_2\text{O} + \text{D}_2$  IN THE COLLISION ENERGY RANGE 0-2 eV.** In a tandem mass spectrometer we have measured the excitation functions (reaction cross section as a function of collision energy) for the following solvated-ion reactant pairs:  $\text{OH}^- \cdot (\text{H}_2\text{O}) + \text{H}_2$ ;  $\text{OD}^- \cdot (\text{D}_2\text{O}) + \text{D}_2$ ; and  $\text{OH}^- \cdot (\text{H}_2\text{O}) + \text{D}_2$  - in the collision energy range 0-2 eV. Product channels include  $\text{H}_3\text{O}^-$ -type production, collision-induced dissociation of reactants and products ( $\text{OH}^-$  and  $\text{H}^-$  types) and isotopic mixing. These solvated-ion reactions are used to correlate the reactivity of the isotope exchange reaction  $\text{OH}^- + \text{D}_2 \rightarrow \text{OD}^- + \text{HD}$  occurring in the gas phase and solution, identifying a proton-transfer mechanism occurring within  $\text{H}_3\text{O}^-$  intermediate. **087725 RADIATION-INDUCED REDUCTION OF VANADIUM(IV) TO VANADIUM(II) IN AQUEOUS PICOLINATE-FORMATE SOLUTIONS.** Quantitative reduction of  $\text{V(IV)(pic)}_n$  to  $\text{V(III)(pic)}_n$ , and then to

$\text{V(II)(pic)}_n$  ( $1 \leq n \leq 3$ ) occurs when  $\text{N}_2\text{O}$ -saturated formate solutions (pH 4.2-6.3) containing  $\text{V(IV)}$  and picolinic acid (2-carboxypyridine) are irradiated. Pulse radiolysis measurements show that  $\text{CO}_2^{\text{MIN}}$  reacts with picolinate only when the N-atom is protonated ( $k = 2.7 \times 10^8 \text{ dm}^3 \text{ mol}^{-1} \text{ s}^{-1}$ ). Reduction of  $\text{V(IV)(pic)}_n$  and  $\text{V(III)(pic)}_n$  is effected by the electron adduct of the protonated picolinate ( $\text{picH}^-$ ) with rate constraints at pH 4.2 of  $(3.5 \pm 0.2) \times 10^7 \text{ dm}^3 \text{ mol}^{-1} \text{ s}^{-1}$  for  $\text{V(IV)(pic)}_n$  and  $(6.9 \pm 0.4) \times 10^8 \text{ dm}^3 \text{ mol}^{-1} \text{ s}^{-1}$  for  $\text{V(III)(pic)}_n$ . No reduction of  $\text{V(II)(pic)}_n$  is observed. (Author abstract). 8 Refs.

**087726 SPECTRAL AND KINETIC PROPERTIES OF INTERMEDIATES INDUCED BY REACTION OF HYDRATED ELECTRONS WITH ADENINE, ADENOSINE, ADENYLIC ACID AND POLYADENYLIC ACID: A MULTICOMPONENT ANALYSIS.** The overlapping transient optical absorption spectra obtained from pulse radiolysis experiments in which the hydrated electron reacted with adenine, adenosine, 5'-adenosine monophosphate and polyadenylic acid were measured and analysed. The analysis consists of a multi-component analysis which yields the number of different species and a set of orthonormal basis spectra. From this set of basis spectra together with a number of trial models for the possible kinetics of the different species the best model is determined by fitting the original data. In this way the molar absorptivity spectra and the kinetics of the species can be found. To describe all the spectra of the adenine-containing compounds in a consistent way we need, at most, three different species. (Author abstract). 20 Refs.

**087727 INTERACTION OF RADIATION-GENERATED RADICALS WITH MYOGLOBIN IN AQUEOUS SOLUTION-VI REDUCTION OF FERRIMYOGLOBIN BY  $\alpha$ -HYDROXYALKYL RADICALS.** G-values of the formation of ferromyoglobin (Mb) have been determined for the continuous  $\gamma$ -radiolysis of  $\text{N}_2\text{O}$ -saturated neutral aqueous solutions containing ferromyoglobin (Mb) and a series of aliphatic alcohols (RH) under conditions such that the competition for the primary  $\cdot\text{OH}$  radicals favors RH. A comparison of the efficiencies of reduction of Mb by the secondary organic radical formed via H-abstraction reactions with estimates from the literature of the fraction of  $\cdot\text{OH}$  attack at the C-atom  $\alpha$  to the  $\cdot\text{OH}$  group indicates that  $\alpha$ -hydroxyalkyl radicals are primarily responsible for the observed reduction. Significantly lower reduction yields are observed when RH = 1,2-diol, compared with the expected yields of strongly reducing 1,2-dihydroxyalkyl radicals; the initial reducing radicals convert into inactive  $\beta$ -ketoanion analogues so that the reduction of Mb is not kinetically competitive with the  $\beta$ -elimination process. Mb is useful as a probe of the occurrence of occurrence of slow conversion processes involving radiolytically-generated radicals. (Author abstract). 27 Refs.

**087729 NANOSECOND PULSE RADIOLYSIS INVESTIGATION OF SOLUTE EXCITED STATES FORMATION IN 3-METHYLPENTANE AT LOW TEMPERATURES.** The influence of temperature down to 90 K, on the formation of excited states in the nanosecond pulse radiolysis of aromatic solutes (9,10-diphenylanthracene, naphthalene) in 3-methylpentane was investigated. Lowering the temperature decreases the yield of solute singlets and triplets generated during the pulse and extends the time range of excited state formation up to milliseconds. The mechanism of solute excited state formation in irradiated saturated hydrocarbons is discussed. (Author abstract). 41 Refs.

**087730 NATURE OF THE TRANSITIONS COMPRISING THE OPTICAL ABSORPTION SPECTRA OF SOLVATED ELECTRONS.** The theory of photoejection spectra of molecular anions is adapted for application to analyses of optical absorption data of solvated electrons in a number of different solvents. The results obtained generally support the identification of solvated electron optical absorption spectra entirely as bands of bound-to-continuum transitions and not as bound-to-bound transitions. Analyses of the absorbance behavior near the threshold for absorption lead to the conclusion that the solvated electron ground state deviates appreciably from spherical symmetry. Alternatively, the solvated electron ground state in  $\text{ND}_3$  may be nearly spherically symmetric with a thermally accessible excited state of lower symmetry. ? (Author abstract). 43 Refs.

**087731 REACTIVITY OF H, OH AND  $e_{\text{aq}}^-$  WITH NICOTINIC ACID: A PULSE RADIOLYSIS STUDY.** The reactivity of aqueous nicotinic acid (NA) towards  $\text{OH}$ ,  $e_{\text{aq}}^-$  and H-atoms has been investigated in the pH-range 0.3-13.8. The OH attack on NA [ $k = (2.5 \pm 0.2) \times 10^9 \text{ M}^{-1} \text{ s}^{-1}$ ] and its N-protonated forms [ $k = (2.2 \pm 0.2)$ ] gives OH-adducts with pH-dependent optical spectra. The reaction of H-atoms with NA in the pH-range 6-12 [ $k = (6.0 \pm 0.5) \times 10^8 \text{ M}^{-1} \text{ s}^{-1}$ ] results in the formation of one type of transient, the H-Adducts on ring carbons ( $\gamma_{\text{max}} = 315 \text{ nm}$ ,  $\epsilon_{315} = 4500 \pm 200 \text{ M}^{-1} \text{ s}^{-1}$ ;  $\text{pK} = 6.7 \pm 0.2$ ). With the N-protonated forms of NA, however, two kinds of radicals are produced pyridinyl and H-adduct on ring carbons. The reaction of  $e_{\text{aq}}^-$  with NA was reinvestigated. The kinetic and spectroscopic data are in good agreement with those previously reported. (Edited author abstract). 25 Refs.

## Applications

**087732 MULTIPLE USES OF A JS 7400.** A radiation processing plant is described. It started operation in 1980, and the aim was to sell sterilization services of medical supplies to industries. Due to an economical recession in Brazil there was a fall in this market and as a consequence an occupancy 50% resulted. We had then to search for new markets in the field of high dose irradiation. The market had to be widened to a diversity of materials with a wide dose range. The materials to be irradiated are: potatoes and onions for sprout inhibition; tropical fruits for desinfection; dry foods and raw material for radurization; medical products for sterilization; impregnation of wood for wood polymer compound; diodes for the electronic industry; and gem stones for color changes. In order to attend such a wide range of doses special

arrangements and irradiation positions had to be developed at the plant. 4 refs.

## Denmark

**087733 APPROVAL AND CONTROL OF RADIATION PROCESSES, EB AND GAMMA.** The documentation which is needed for approval of radiation treated products includes a facility description and an initial plant commissioning procedure. The description of the facility must put particular emphasis on those parameters which in effect determine the dose in the product. For a gamma plant these are source strength and geometry, product conveyor geometry and mode of transport, and in a similar manner for electron accelerator plants, the beam characteristics, power and geometry, and product transport parameters. In order to maintain the correct dose, a routine monitoring system must be established. This consists of measurement and recording of the process parameters, and of routine dosimetry. For a gamma plant, the most important (and sometimes the only) variable parameter is the product speed (or dwell time), while for electron beam plants, the beam parameters must also be recorded. (Edited author abstract) 18 refs.

## Equipment

**087735 PULSE RADIOLYSIS APPARATUS WITH A SCANNING LINAC AND SOME EXPERIMENTAL RESULTS.** The first set of pulse radiolysis apparatus in China with microsecond time resolution was built at Beijing Radiation Center (Institute of Low Energy Nuclear Physics, Beijing Normal University). The radiation source is a 5-MeV s-band scanning Linac which is mainly used as a radiator for doing radiation processing technology studies in this laboratory. In order to use this Linac as a radiation source in pulse radiolysis, some special designs of electronic, mechanical, optical and sample-holding systems were made. Several experiments

on pulse radiolysis of aqueous solution have been done successfully proving that this apparatus is very useful in our attempt to combine the industrial applications of radiation with the basic research of radiation chemistry in this laboratory. (Author abstract) 9 refs.

## Taiwan, China

**087736 CURRENT STATUS AND PROSPECTS OF RADIATION PROCESSING STUDIES IN TAIWAN, R.O.C.** The research on radiation processing in the past 5 years in Taiwan covers industrial application of radiation-induced polymerization and curing, medical application of radiosterilization of medical supplies, chemicals, and amniotic membrane for wound dressing as well as agricultural application of food irradiation and genogenesis etc. Radiation-induced polymerization, for example, applied on wood and bamboo plastic composite of methyl methacrylate, radiation curing on polyurethane and silicon rubber for biomedical materials used to separate oxygen from nitrogen and on crosslinking of pp and ps for artificial skin for wound dressing were all successful. The legislation on radiosterilization of medical supplies and food irradiation of 14 items has been approved by National Health Administration, R.O.C. in July of 1982 and January of 1985 respectively. Even 24 hrs-operation of 1 Mega curie irradiation plant at INER cannot satisfy the requirement for radiosterilization of medical supplies. (Edited author abstract) 21 refs.

**087737 TEST BEAM STUDIES OF A PROTOTYPE FOR THE BES BARREL SHOWER COUNTER.** A prototype of the barrel shower counter for the Beijing Spectrometer (BES) has been tested with electrons and pions in a momentum range from 0.2 to 2.0 GeV/c at the test beam line T1 KEK 12 GeV proton synchrotron. The preliminary results are now reported. Four kinds of gas mixture were used in the prototype: 40% Ar/60% isobutane, 44.5% Ar/44.5% CH<sub>4</sub>/11% methylal, 47% Ar/47% CH<sub>4</sub>/6% methylal, and 49.3% Ar/49.3% CH<sub>4</sub>/1.4% ethyl alcohol. The results show that using SQS tube as a sampling means in the BES shower counter is feasible for Beijing Electron Positron Collider (BEPC) energy region of 2×2.2/2.8 GeV. (Author abstract) 16 refs.

**087738 BEHAVIOR OF THALLIUM BROMIDE CONDUCTION COUNTERS.** A study at various temperatures has been made of approximately a dozen TlBr single crystals in order to find their properties as radiation induced conduction counters. Use of alpha particle sources showed whether holes or electrons were responsible for the observed behavior. Gamma ray studies showed

rudimentary spectrometry performance whereas alpha particles usually resulted in peaks of approximately 25% fwhm. Long rise times were observed in some crystals and shorter rise times in others, the variability accounting for as much as a factor of 6. The energy required to produce a free electron-hole pair was observed to be 10.3±2 eV. Breakdown phenomena were observed near room temperature and are described in the text. (Author abstract) 16 refs.

**087740 OPERATING CHARACTERISTICS OF SANDWICH MICROCHANNEL PLATES.** A sandwich plate is a novel type of high-gain electron multiplier formed by bonding, in permanent contact, three standard (channel length-to-diameter ratio L/D = 40:1) image-intensifier multichannel plates. This geometry has advantages of mechanical and electrical simplicity when compared with conventional multiplate stacks. An evaluation of sandwich plates for X-ray photon counting is presented. Sandwich plate gain, gain uniformity, pulse height FWHM, dark noise, high-count-rate operation, and X-ray quantum efficiency are compared with previous measurements made with conventional two-stage MCP (microchannel plate) multipliers. 9 refs.

Pearson, J.F. (Univ of Leicester, Engl); Lees, J.E.; Fraser, G.W. *IEEE Trans Nucl Sci* v 35 n 1 Feb 1988, 34th Nucl Sci Symp, San Francisco, CA, USA, Oct 21-23 1987 p 520-523.

**087741 EVALUATION OF LONG LIFE (L<sup>2</sup>) MICROCHANNEL PLATES FOR X-RAY PHOTON COUNTING.** An evaluation is presented to Galileo Long-Life (L<sup>2</sup>) microchannel plates (MCPs) operated in pulse counting mode. Modal gain, pulse height FWHM, gain uniformity, and high-count-rate performance data are compared with measurements made with MCPs of conventional glass composition. Despite the absence of potassium (and hence, of the β-emitter <sup>40</sup>K) from the L<sup>2</sup> glass, dark count rates for the L<sup>2</sup> MCPs are about five-times higher than those of standard MCPs, due to the presence in the glass of the radioisotope <sup>87</sup>Rb. The measurements indicate that Galileo L<sup>2</sup> MCPs, even those with short channel lengths, have several desirable characteristics for photon-counting applications. They also confirm that changing the radioisotope composition of channel plate glass influences the dark noise count rate, further supporting an internal radioactivity noise model developed by the authors. 14 refs.

**087744 STABILITY OF IRRADIATION-INDUCED VOIDS BASED ON THE CUSP CATASTROPHE.** The aim is to investigate the stability of irradiation-induced voids. It is shown that catastrophe theory, which already turned out to be an excellent method to treat questions of stability in many fields of science and engineering, can also be applied to deal with the stability of voids. It admits to analyze the sensitive interplay of irradiation and material parameters as well as the key role of transmutant helium to void stability. Assuming that the helium gas within the cavities obeys the ideal gas law the proposed framework leads to an elementary catastrophe of the cusp type which demonstrates the range of the number of gas atoms being of physical importance. The potential associated with this catastrophe as a function of the cavity radius is characterized by one minimum and one maximum indicating the stable bubble radius and the unstable critical cavity radius, respectively. (Author abstract) 10 refs.

## Mathematical Models

**087745 DIRECT AND FAST COMPUTING METHOD FOR DAMAGE ENERGY DEPTH DISTRIBUTION IN ION IMPLANTED MATERIALS.** A theoretically simple and computationally fast method for calculating damage energy density distribution for ions implanted into noninsulating materials is presented. The effect of the energy transported by the recoiling target atoms is taken into account in order to extend the calculation to lower energies and the near-surface target region. It is found that the results obtained over energy and mass ranges of interest for ion implantation experiments are in good agreement with previously reported experimental and calculated damage distributions. Special emphasis is placed upon applications to surface studies, sputtering and amorphization of Si(111) surfaces, as recently reported in a REM study. (Author abstract) 36 refs.

**087746 MONTE CARLO SIMULATIONS OF EFFECTS DUE TO DELTA RAYS IN ALUMINUM DRIFT-TUBE COUNTERS.** The spatial resolution of drift-tube counters of the VENUS muon detector in the test arrangement for cosmic muons was shown to have two distinct components. The first component, which corresponds to about 96% of the detection efficiency, has a normal distribution with an rms spatial resolution of about 1 mm. It is evident that the second component with about 3.6% of the total incident muons corresponds to events for which delta-rays generated inside the chamber wall are scattered closer to the sense wire or between the sense wire and the true tracks. Such confused track events are unavoidable in drift-tube counters with a single TDC scaler per cell. The general characteristics of phenomena caused by delta rays in drift-tube counters are studied by Monte Carlo simulations for various detector arrangements. The upper limits of the knock on electron yield and confused track rate are found to be respectively 14% and 6% of the total incident muons with medium energies of the order of 10 GeV or less in typical muon detector systems consisting of aluminum drift-tube counters and iron absorbers. For drift-tube counters with very thin aluminum walls these limits are reduced to about 11% and 5%, respectively. (Author abstract) 7 refs.

**087748 'DELTA', A LARGE SOLID ANGLE DETECTION SYSTEM FOR HEAVY FRAGMENTS.** To detect the heavy fragments ( $Z > 8$ ) emitted at large angle ( $30^\circ < \theta < 150^\circ$ ) in heavy ion collisions at GANIL, a large solid angle detection system has been built. It consists of 18 independent cells surrounding the target, the beam axis being the revolution axis. In each cell, a fragment penetrates at first into a parallel plate avalanche counter

with localization which gives velocity, position and  $\partial E/\partial x$  measurements and then into an ionization chamber with longitudinal field for the residual energy measurement. The Z evaluation is performed over a large range of velocities ( $0.05 < E/A < 5$  Mev/u) for atomic numbers ranging from 8 to 90. (Author abstract) 10 refs.

**087749 MONTE CARLO SIMULATION OF THE RESPONSE OF Si(Li) X-RAY DETECTORS TO PROTON INDUCED K X-RAYS OF LIGHT ELEMENTS ( $12 \leq Z \leq 32$ ) APPLIED TO EFFICIENCY DETERMINATION.** Measurements of proton induced K X-ray spectra of elements in the range  $12 \leq Z \leq 32$  have been performed, using two different Si(Li) detectors. A new detector model is deduced from the measured ratios of low energy background counts to photopeak counts. This detector model assumes both the existence of a surface layer with reduced charge carrier collection efficiency and the existence of a low concentration of small regions of detector defects, which have enhanced charge carrier recombination probability, within the volume of the Si(Li) detector, to explain the observed low energy background. Monte Carlo simulations of the response of two different Si(Li) detectors to K X-rays have been performed in order to quantify possible contributions of detector front contact and dead layer, respectively, to the measured X-ray spectra. Upper limits of those contributions and upper limits of dead layer thickness are given. The consequence of these results to detector efficiency calibration measurements are discussed. (Author abstract) 19 refs.

**087750 RECORDING IONIZING RADIATION DOSES WITH THE AID OF TWO IMMISCIBLE DIELECTRIC LIQUIDS SITUATED IN AN ELECTRIC FIELD.** The authors of a previous article have shown that ionizing radiations can be recorded with a liquid-gas system. This article considers theoretical and experimental investigations of the possibility of recording ionizing radiations with a liquid-liquid system. The effective atomic number of the ionization medium can be changed within certain limits when an organic liquid-liquid system is employed. One can expect an increase in the sensitivity of liquid detectors relative to gas-filled detectors, and also increased measurement capabilities of neutron fluxes and compound radiations.

Suslov, A.P.; Patrusev, G.N.; Zavgorodnii, V.S.; Naumov, V.M. *Sov At Energy* v 62 n 1 Jan 1987 p 72-74.

**087751 SIGNAL RISE TIMES AND ENERGY RESOLUTION IN RADIAL SEMICONDUCTOR DRIFT CHAMBERS.** The risetimes expected in a semiconductor drift chamber (SDC) incorporating a constant drift field component to the electric field have been calculated. The combined influence of systematic risetime broadening and the random broadening processes has been determined and applied to some hypothetical test cases. It is predicted that the resolution of a 50 mm diameter SDC at 300 K will be limited by straggle in the dead layer for alpha particle spectrometry. The same detector could also detect 10 keV X-rays with an anticipated  $\sigma$  of 1.4 keV, limited by the electronic noise. (Author abstract) 15 refs.

**087752 MAXIMAL AREA OF SUPERCONDUCTING TUNNELING JUNCTION X-RAY DETECTORS DETERMINED BY THE REQUIRED SIGNAL-TO-NOISE RATIO.** The intrinsically high energy resolution of superconducting tunneling junctions (STJ)

requires a low noise charge sensitive amplifier circuit. The noise sources of such a junction + amplifier circuit are discussed. The dominant noise sources are the series noise and the 1/f flicker noise of the FET input stage, amplified by the large input capacitance of the STJ-detector. Means to reduce this capacitance are discussed. Reducing the preamplifier noise by a factor of two and the height of the potential barrier of the insulating layer by two orders of magnitude, by keeping the large conductance of the junction constant, would allow an increase in junction area by a factor of 15. (Author abstract) 9 refs.

**087753 INFLUENCE OF DIFFERENT DETECTOR PARAMETERS ON THE NEUTRON SENSITIVITY OF OSL DETECTORS.** On the basis of a method for the calculation of the neutron sensitivity of OSL detectors with a high content of hydrogen a systematic investigation of the influence of different detector parameters on the neutron sensitivity was carried out. The detector thickness, the thickness of the contact radiator, the luminophor contents and the grain size of the used luminophor influence the neutron sensitivity, first of all in the energy range of fast neutrons. Especially the use of small grain luminophor considerably increases the sensitivity whereas the other parameters have a small influence on the neutron sensitivity. (Author abstract) 17 refs.

**087754 NEW METHOD FOR MEASURING THE NEUTRON-INDUCED BACKGROUND IN BGO COMPTON-SUPPRESSED Ge DETECTORS APPLIED TO IN-BEAM  $\gamma$ -RAY STUDIES.** This paper describes a new method for determining the response of a BGO Compton-suppressed Ge detector to evaporation neutrons emitted in (HI, xn) reactions. It exploits the large difference between the attenuation of  $\gamma$ -rays and the attenuation of neutrons in a heavy metal absorber for measuring the neutron-induced  $\gamma$ -ray spectrum. An iterative procedure has been used to correct for the residual contribution of direct  $\gamma$  radiation in the measured spectrum. The method can easily be adapted to other types of  $\gamma$ -ray detectors. The technique does require a detailed knowledge of the detector response to  $\gamma$ -rays, both with and without the absorber. 7 refs.

**087755 RESPONSE OF SODA GLASS DETECTORS TO ACCELERATED HEAVY IONS FOR CALIBRATION TO COSMIC RAY HEAVY IONS.** Pre-annealed and pre-etched samples of soda glass detectors have been exposed vertically to  $^{18}\text{Ar}$ ,  $^{26}\text{Fe}$ ,  $^{28}\text{Si}$ ,  $^{36}\text{Kr}$  and  $^{54}\text{Xe}$  ion beams of various energies at the Joint Institute of Nuclear Research (JINR) Dubna (Moscow) U.S.S.R. The exposed samples were etched in the new etchant (HF 48 vol% +  $\text{H}_2\text{SO}_4$  96 vol% +  $\text{H}_2\text{O}$  in the ratio of 6:1:18 with a small amount of Zn) at 40°C. The variation of etch pit diameter against etching time has been studied and the total etchable range for different heavy ions in this detector has been determined. The energy loss rate and range of the heavy ions in this detector have been computed theoretically. Finally, the response of the detector to the heavy ions and the relationship between the etch rate ratio and the corresponding energy loss rate have been studied. (Author abstract) 10 refs.

**087756 CHARACTERISTICS OF SECONDARY-EMISSION DETECTORS UNDER GAMMA IRRADIATION.** Impulsive radiation from nuclear reac-

tors and strong-current accelerators in the dosage range up to  $1 \cdot 10^{13}$  rad/sec (1 rad = 0.01 Gy) is recorded using secondary-emission detectors (SED) with systems of axicylindrical, plane-parallel, and concentric spherical electrodes. In this paper the authors present the results of investigations of the characteristics of SED with plane-parallel stainless steel electrodes, and the design with a system of congruent spherical electrodes is described and its advantages for the determination of the dosage of  $\gamma$  radiation with uncertain spatial-angular and energy distributions are demonstrated. 8 refs.

**087757 MEASUREMENT OF THE ABSORPTION LENGTH AND ABSOLUTE QUANTUM EFFICIENCY OF TMAE AND TEA FROM THRESHOLD TO 120 nm.** The absorption length and absolute photoionization quantum efficiency of TMAE (tetraakis-dimethylamino-ethylene) and TEA (triethylamine) vapors have been measured in a wavelength interval from 120 to 280 nm. Both of these materials can serve as a photosensitive agent for ultraviolet photon detectors used in high energy and nuclear physics experiments and for medical imaging. The absorption length and absolute quantum efficiency are important parameters in the design of these detectors. We find that the quantum efficiency for TMAE has a peak of 58% at 146 nm and rises again toward shorter wavelengths. The TEA quantum efficiency reaches a peak of 33% at 153 nm and has a plateau of 17% below 135 nm. We fail to observe a second peak in TEA around 136 nm as has been previously reported. (Author abstract) 28 refs.

**087759 UV AND XUV QUANTUM DETECTION EFFICIENCIES OF CsI-COATED MICROCHANNEL PLATES.** Quantum efficiency measurements are presented for CsI-coated microchannel plates in the waveband 25-200 nm. The influence of exposure to a humid atmosphere on the efficiency of the CsI-photocathode has been studied in great detail. Due to the very high susceptibility of CsI to humidity, particularly for wavelengths longer than 140 nm, the best quantum efficiencies have been obtained for a CsI-coated channelplate continuously stored in vacuum. The results are interpreted on the basis of photoelectron emission theory. (Author abstract) 26 refs.

**087760 STABLE OHMIC CONTACTS TO ZINC TELLURIDE.** Zinc Telluride is a wide, direct bandgap, II-VI compound semiconductor which, because of its high density, has potential as a gamma-ray detector. Ohmic contacts to this material using Au-Cg, Ag-Pt, Pt and Cu-Pt have been fabricated and tested at elevated temperatures. Specific contact resistivities ranged from  $4.9 \times 10^{-2}$  ohm-cm<sup>2</sup> to 1.0 ohm-cm<sup>2</sup> depending on the annealing process and/or operating temperature. Platinum yielded the lowest resistivity following stabilization at an operat-

ing temperature of 150°C. (Author abstract) 7 refs.

**087765 TRANSITION RADIATION DETECTORS FOR ELECTRON IDENTIFICATION BEYOND 1 GeV/c.** Transition radiation detectors (TRDs) have been tested for the separation of electrons from pions in the momentum range between 1 and 6 GeV/c. Foams as well as fibers and foils served as radiator materials while two types of chambers, a longitudinal drift chamber (DC) and a multiwire proportional chamber (MWPC), both of 16 mm depth and dominantly filled with xenon, were used for detecting the transition radiation photons with a setup of four chambers. Analyzing the data we compared the methods of mean, truncated mean and of maximum likelihood of the total charge measurements and several methods of cluster analysis. As a result of the total charge measurements performed at test beams at CERN and DESY we obtained about 1% pion contamination at 90% electron efficiency for the polypropylene materials in the configuration of four modules with a total length of 40 cm.

An improvement by a factor of about two for the electron/pion discrimination can be obtained in the case of a detailed analysis of the clusters. (Author abstract) 25 refs.

**087766 ON THE PROPERTIES OF LOW-PRESSURE TMAE-FILLED MULTISTEP UV-PHOTON DETECTORS.** Single photoelectrons can be efficiently localized in low pressure (10-40 Torr) TMAE-filled multistep UV-photon detectors. We present, in detail, the results of a systematic study of the properties of such detectors operated with single electrons photoproduced in pure ethane, isobutane, and their mixtures with TMAE. The study includes gaseous amplification, single electron transport parameters, avalanche geometry, localization properties and secondary avalanche formation effects. Detectors based on this mode of operation are presently being developed for Cherenkov ring imaging in ultrarelativistic heavy ion collisions. Other applications are briefly discussed. (Author abstract) 25 refs.

**087767 LARGE-AREA FAST-TIMING DETECTORS DEVELOPED FOR THE TOFI SPECTROMETER.** Large-area fast-timing detectors have been developed for use in the TOFI spectrometer. A gridless detector was constructed in which secondary electrons emitted from a thin (approx. 80  $\mu\text{g}/\text{cm}^2$ ) target foil were transported isochronously to microchannel plate electron multipliers by crossed electric and magnetic fields. A novel convex anode was designed to reduce the time dispersion caused by the position at which the secondary electrons were collected. Timing performance for aluminum oxide target foils was found to be superior to that of carbon foils. Intrinsic timing resolutions of 68 and 109 ps fwhm have been measured for 5.4 MeV alpha particles from a thin  $^{241}\text{Am}$  source for two different detectors with active areas of 270 and 1000  $\text{mm}^2$ , respectively. Detection efficiencies in excess of 75% for alpha particles were measured. (Author abstract) 15 refs.

**087770 FAST TIME-TO-DIGITAL CONVERTER FOR POSITION-SENSITIVE RADIATION DETECTORS WITH DELAY LINE READOUTS.** A fast time-to-digital converter (TDC) has been developed for use with position-sensitive radiation detectors having delay line readouts. The device is recommended for detector applications where high position resolution and low distortion are required at high rates. The device has 2 ns time resolution, less than 0.1% differential nonlinearity, and a recovery time of 70 ns. When used with a detector system having a delay line of temporal length  $\tau$ , the following performance has been achieved: (1) a position digitization of 1 position resolution element per ns of delay line; (2) an average dead time of  $(3/4\tau + 70) \text{ ns}$ ; (3) a maximum incident radiation rate of  $\approx 4/\tau$ ; and (4) a maximum conversion rate of  $\approx 1/(3\tau)$ . Discriminator circuits reduce pile-up distortion to negligible levels for rates as high as those listed above. Finally, two converters may be connected together for synchronous operation as required by 2-dimensional (x-y) detectors. (Author abstract) 3 refs.

**087777 SIMPLE PHOSWICH SYSTEM.** Normal phoswich detector systems use a combination of  $\text{NaI(Tl)}$  and  $\text{CsI(Na)}$  scintillators and require the application of careful pulse-shape discriminator techniques to resolve the two components in the scintillation light output which have decay constants of 250 and 630 ns respectively. These techniques provide a good anticoincidence veto efficiency for a relatively narrow range in the ratio of energy deposits in the two crystals and for a detector system whose temperature is carefully controlled. This paper describes the performance of a simple phoswich which makes use of the fast UV signal from a  $\text{BaF}_2$  crystal to provide a prompt veto signal. The performance to be expected from various combinations of a  $\text{BaF}_2$  anticoincidence crystal with other primary detectors is presented. These simulations have been verified by simple experimental tests. (Author abstract) 2 refs.

**087785 LEAD IODIDE NUCLEAR SPECTROMETERS.** The preparation of radiation detectors from semiconducting lead iodide is discussed, and the performance of these devices as X-ray and gamma-ray spectrometers is evaluated. Detectors prepared from melt-grown crystals exhibit good energy resolution for low-energy (<10 keV) X-rays. The energy resolution for higher-energy photons is lower, consistent with the measured values of the electron and hole mobility-lifetime products. Measurements at elevated temperatures show that the detectors continue to operate well over 100°C. 9 Refs.

Lund, J.C. (Radiation Monitoring Devices Inc, Watertown, MA, USA); Shah, K.S.; Squillante, M.R.; Sinclair, F. *IEEE Trans Nucl Sci* v 35 n 1 Feb 1988, 34th Nucl Sci Symp, San Francisco, CA, USA, Oct 21-23 1987 p 89-92.

**087786 BALLISTIC DEFICITS IN PULSE SHAPING AMPLIFIERS.** The authors consider the problem of ballistic deficit, which is the loss of output signal amplitude due to the interplay between the finite charge-collection times in a detector and the characteristic time constants of the amplifier. Quantitative estimates of ballistic deficits have been developed by using numerical integration techniques on a microcomputer and by exact calculations using Laplace transforms. A practical procedure is developed in which an actual amplifier with even an unspecified complex-pole network can be accurately related to an equivalent semi-Gaussian shaping network the exact solution of which is known. Simple formulas for estimating ballistic deficits and resulting degradation in spectral energy resolutions are given. 3 Refs.

**087787 BALLISTIC DEFICIT CORRECTION IN SEMICONDUCTOR DETECTOR SPECTROMETERS.** At high energies the energy resolution of  $\gamma$ -ray spectrometers using large-diameter coaxial germanium detectors can be dominated by ballistic-deficit effects, particularly when short processing times are used to permit high-rate operation. This results because that rise-time variations in the detector signal are reflected in amplitude fluctuations after the signals pass through pulse shapes. A method is described for compensating for these effects on a pulse-by-pulse basis, using the observation that the loss of amplitude for slowly rising signals is accompanied by a delay in the peak time of the shaped output signal. The simple analog corrector circuit uses a relationship whereby the amplitude deficit is roughly proportional to the square of the time delay in the peak. Results show considerable improvements in the energy resolution of germanium  $\gamma$ -ray spectrometers at high energies. 5 Refs.

**087788 PEDESTAL DRIFT AND CABLE PICKUP PROBLEMS IN MULTIPLEXED ANALOG SIGNAL TRANSMISSION.** Sample-and-hold circuits followed by analog multiplexing are often used to reduce the number of cables required between large multielement high-energy detectors and their associated analog-to-digital converters. All sample-and-hold circuits have charge-injection pedestals that can vary with time, temperature, and power-supply voltages. These variations are often correlated among many channels so that total energy sums may

be degraded, even though individual pedestal drifts remain negligible. A double-sampling system is described that substantially decreases charge-injection pedestals and their variations. The effects of low-frequency pickup in long signal cables, which also tend to be correlated, are very much reduced as well. 3 Refs.

**087789 DESIGN OF A CHARGE SENSITIVE PRE-AMPLIFIER ON HIGH RESISTIVITY SILICON.** A low-noise, fast, charge-sensitive preamplifier was designed on high-resistivity, detector-grade silicon. It is built at the surface of a fully depleted region of n-type silicon, allowing it to be placed very close to a detector anode. The preamplifier uses the classical input-cascode configuration with a capacitor and a high-value resistor in the feedback loop. The output stage of the preamplifier can drive a load up to 20 pF. The power dissipation of the preamplifier is 13 mW. The amplifying elements are single-sided gate JFETs developed for this application. Preamplifiers connected to a low-capacitance anode of a drift-type detector should achieve a rise time of 20 ns and have an equivalent noise charge, after suitable shaping, of less than 50 electrons. This performance translates to a position resolution better than 3  $\mu$ m for silicon drift detectors. 6 Refs.

**087790 FLEXIBLE 128 CHANNEL SILICON STRIP DETECTOR INSTRUMENTATION INTEGRATED CIRCUIT WITH SPARSE DATA READOUT.** A full-custom CMOS integrated circuit for silicon strip detector systems has been designed, fabricated, and tested. The circuit contains 128 parallel data-acquisition channels and considerable peripheral circuitry. Each channel consists of a low-noise, low-power, charge-sensitive amplifier, a multistage autobalanced comparator, an analog multiplexer, nearest-neighbor logic, priority-search logic, and a share of a position-encoding read-only memory. The analog system can subtract both detector pedestal and leakage current on a channel-by-channel basis. A key feature of this design is the inclusion of on-chip sparse read-out circuitry, which allows efficient management of low-occupancy events. Designed for use at the Collider Detector Facility (CDF) at Fermilab, the circuit is suitable for large-scale silicon detector systems requiring a large, dense array of fast, low-power electronics. 6 Refs.

**087791 RESULTS OF SILICON STRIP DETECTOR READOUT USING A CMOS LOW POWER MICROPLEX (MX1).** A system for reading out silicon strip detectors has been fabricated on a CMOS integrated circuit. The chip consists of an array of 128 amplifiers with a single multiplexed output. These chips have been bonded to a 256-channel silicon strip detector. Results are reported on the electrical parameters of the chips and on data taken during exposure of the instrumented detectors to minimum-ionizing beta particles. The radiation toler-

ance of the device has been investigated. The MX1 is working to specification and is presently being incorporated into equipment. 6 refs.

**087792 IN BEAM PERFORMANCE OF A LOW PRESSURE UV RICH DETECTOR.** A low-pressure multistep, TMAE-filled, UV-sensitive detector has been developed for Cerenkov ring imaging for ultrarelativistic heavy-ion experiments (HELIOS-CERN). A description is given of the detector structure and its basic properties, and the experimental setup and the detector performance in tests with high-energy electrons are presented. Three modes of readout are used: three-wire coordinates and flash analog-to-digital converters; pad readout; and optical recording of the avalanches. Single photons can be localized with an accuracy of  $\sigma \approx 2$  mm, mainly due to single-photoelectron diffusion and to chromatic dispersion in the radiator gas. The experimental  $N_0$  values obtained by the three methods are close to those expected, taking into account the various losses due to the test conditions. 19 refs.

(Weizmann Inst of Science, Rehovot, Isr); Chechik, R.; Drees, A.; Fischer, P.; Fraenkel, Z.; Glassel, P.; Lamade, G.; Ries, H.; Sauvage, D.; Schon, A.; Schmoetten, E.; Specht, H.J.; Steiner, V.; Tseruya, I. *IEEE Trans Nucl Sci* v 35 n 1 Feb 1988, 34th Nucl Sci Symp, San Francisco, CA, USA, Oct 21-23 1987 p 404-408.

**087793 PAD READOUT FOR GAS DETECTORS USING 128-CHANNEL INTEGRATED PREAMPLIFIERS.** A novel two-dimensional readout scheme for gas detectors is presented that uses small metal pads with 2.54-mm pitch as an anode. The pads are read out via 128-channel VLSI low-noise peramplifier/multiplexer chips. These chips are mounted on  $2.8\text{ cm} \times 2.8\text{ cm}$  modules, which are directly plugged onto the detector backplane, delay-chained with jumpers, and read out sequentially. The readout has been successfully tested with a low-pressure, two-step, TMAE-filled, ultraviolet-sensitive ring imaging Cerenkov counter. A single-electron efficiency of  $>90\%$  was observed at moderate chamber gains ( $<10^6$ ). The method offers high electronic amplification, low noise, and high readout speed with a very flexible and compact design that is suited for space-limited applications. 11 refs.

(Univ Heidelberg, West Ger); Drees, A.; Glassel, P.; Lamade, G.; Ries, H.; Schon, A.; Specht, H.; Breskin, A.; Chechik, R.; Fraenkel, Z.; Sauvage, D.; Steiner, V.; Tseruya, I.; Horisberger, R. *IEEE Trans Nucl Sci* v 35 n 1 Feb 1988, 34th Nucl Sci Symp, San Francisco, CA, USA, Oct 21-23 1987 p 432-435.

**087794 DETECTION OF COHERENT TRANSITION RADIATION AND ITS APPLICATION IN BEAM DIAGNOSTICS AND PARTICLE IDENTIFICATION.** The first observation of the angular distribution of coherent (resonant) transition radiation at soft-X-ray photon energies (1 to 3 keV) is reported. Two different radiators were constructed, each consisting of stack of eight foils of 3.5- $\mu\text{m}$ -thick mylar. One of the radiators was designed to demonstrate interfoil coherence and had foil-to-foil spacing of 8.5  $\mu\text{m}$  throughout the stack. The other radiator had large random spacings that prevented coherent interference between foils. These radiators were irradiated with electron beams with energies ranging from 63 to 97 MeV, and their angular distributions were compared. The distributions were symmetrical around the axis of the transition-radiation cone. For the coherent case the angle of peak photon emission was found to increase with increasing electron-beam energy; for the incoherent case the angle was found to decrease with increasing electron energy. The coherent case is contrary to the normally expected behavior and can be used as the basis of an electron beam-energy diagnostic. 19 refs.

Piestrup, M.A. (Adelphi Technology Inc, Palo Alto, CA, USA); Boyers, D.; Li, Quang; Moran, M.J.; Buskirk, F.R.; Maruyama, X.K.; Neighbours, J.R.; Robinson, R.M.; Snyder, D.L. *IEEE Trans Nucl Sci* v 35 n 1 Feb 1988, 34th Nucl Sci Symp, San Francisco, CA, USA, Oct 21-23 1987 p 464-469.

**087795 BACKGROUND REJECTION TECHNIQUES IN CCD X-RAY DETECTORS FOR ASTRONOMY.** A number of different charge-coupled devices (CCDs) have been exposed to gamma and beta sources in order to simulate the charged-particle background response of spaceborne X-ray astronomy detectors. Two rejection techniques have been investigated: energy veto and pixel-to-pixel anticoincidence. In the most favorable conditions, a rejection of  $>99.9\%$  has been obtained. The latter selection criterion can be used to reject X-ray data in which the event charge is incompletely collected. Improved X-ray energy resolution is obtained, and an upper limit to the Fano factor in silicon is measured. A novel technique for minimizing systematic errors in the X-ray-energy-to-charge-conversion factor is described. 14 refs.

**087797 NEW PORTABLE HAND-HELD RADIATION INSTRUMENTS FOR MEASUREMENTS AND MONITORING.** Hand-held radiation monitors are often used to search pedestrians and motor vehicles for special nuclear material (SNM) as part of a physical protection plan for nuclear materials. Recently, the Los Alamos Advanced Nuclear Technology group has commercialized an improved hand-held monitor that can be used for both physical-protection monitoring and verification measurements in nuclear material control and waste management. The new monitoring instruments are smaller and lighter; operate much longer on a battery charge; are available with NaI(Tl) or neutron and gamma-ray sensitive plastic scintillation detectors; and are less expensive than other comparable instruments. **087799 NON-ACCELERATOR PARTICLE PHYSICS, PROCEEDINGS OF THE WORKSHOP.** This conference proceedings contains 21 papers, all of which

are separately abstracted and indexed. Non-accelerator particle physics experiments are reviewed. Large underground detectors are discussed from a design review standpoint. High energy gamma-ray astronomy research is discussed, including experimental techniques as well as results. Solar neutrino measurements are presented, as well as high energy cosmic ray observations. Dark matter searches and the fundamental properties of particles are presented. The observation of neutrinos emitted from SN1987a was addressed. This supernova explosion is a rare and very historical event. Technical and professional papers from this conference are indexed and abstracted with the conference code no. 10887 in the Ei Engineering Meetings (TM) database produced by Engineering Information, Inc.

**087800 LVD AT GRAN SASSO.** LVD is a large volume detector which will be installed in Hall A of the Gran Sasso Laboratory. This detector is 49 m long, 13.2 m high and 12 m wide. It contains 2280 m<sup>3</sup> of scintillator (1800 t) and 1800 t of steel. The geometric acceptance of LVD for an isotropic flux of particles is greater than 7000 m<sup>2</sup> sr. LVD is the ideal detector for detecting a stellar collapse, anywhere in our galaxy; for studying neutrino oscillations; for searching for the supersymmetric decay mode of the proton; and for looking at the boron neutrinos from the sun. LVD is a very competitive detector for detecting astrophysical neutrino emitting point sources, for performing dark matter searches, for studying single muon distributions, for detecting muon bundles and hence determining the primary cosmic ray composition, and for searching for massive monopoles and other ultra heavy particles. LVD is composed of 190 identical modules, of which the first 10% of these modules will be installed in 1987. (Edited author abstract) 33 refs.

**087801 MACRO DETECTOR AT THE GRAN SASSO LABORATORY.** The MACRO detector is presently under construction, its installation at Gran Sasso being planned to start in September 1987. It is a large area detector, the acceptance for isotropic particle fluxes being around 10,000 m<sup>2</sup> sr, designed to search for rare phenomena in the cosmic radiation. It makes use of three detection techniques: liquid scintillator counters, plastic streamer tubes, and track-etch. It will perform a search for GUT monopoles (or any supermassive charged penetrating particle), a survey of cosmic point sources of HE gammas and neutrinos, a systematic study of the penetrating cosmic ray muons, and will be sensitive to neutrino bursts from gravitational stellar collapses in the Galaxy. (Author abstract) 5 refs.

**087804 STORAGE PHOSPHOR X-RAY DIFFRACTION DETECTORS.** The use of photostimulable storage phosphors as area detectors for X-ray diffraction is described. The elements of a basic acquisition system are explained and the principles of operation are reviewed. A simple model for the transfer of system signal and noise is derived, allowing determination of the detective quantum efficiency (DQE). Using this model, predicted storage phosphor performance can be compared with conventional detector technologies for tasks in X-ray diffraction. (Author abstract) 11 refs.

**087810 STUDY OF A HIGH INTENSITY 746 keV NEUTRINO SOURCE FOR THE CALIBRATION OF SOLAR NEUTRINO DETECTORS.** We describe the test production of a 0.94 PBq (25,400 Ci) source of 746 keV neutrinos coming from the electron capture decay of <sup>51</sup>Cr. This is the first time that such a source has been produced. It was obtained by neutron activation of 12.5 kg of natural granular chromium at the Siloe reactor at Grenoble. If this nuclear reactor were devoted exclusively to the production of <sup>51</sup>Cr from natural chromium, we calculate that the highest activity that could be produced would be around 29 PBq (0.8 MCi) in 45 days of irradiation, for 125 kg of target. With chromium enriched in <sup>50</sup>Cr, we could get around 40 PBq (1.08 MCi) in an irradiation of 21 days, for 45 kg of target containing 17% <sup>50</sup>Cr. Such sources are planned for use in calibrating forthcoming solar neutrino detectors, especially the gallium detector to be installed in the Gran Sasso Underground Laboratory. (Edited author abstract) 23 refs.

## Components

**087812 METHOD FOR SELECTING DETECTOR APERTURES FOR USE IN SRIXE.** A method is presented that will help in selecting the most appropriate detector aperture size for use in SRIXE synchrotron radiation induced X-ray emission measurements. The criterion for selection involves maximizing the fluorescence yield while minimizing background from scattered radiation. The method uses previously published expansions of the scattering cross sections, integrated over solid angle (into 90°), and solving for the value of the aperture aspect ratio where the crossover occurs between terms of the cross section that are proportional to solid angle and terms that change faster than the solid angle. (Author abstract) 9 refs.

**Computer Applications** See Also GAMMA RAYS—Computer Aided Analysis.

**087813 LOS ALAMOS NEUTRON SCATTERING CENTER DATA ACQUISITION SYSTEM.** The data acquisition requirements for the Los Alamos Neutron Scattering Center (LANSCE) are summarized. It consists of a FASTBUS system controlled by a DEC VAXstation II/GPX. The FASTBUS subsystem features four custom high-performance modules interfaced to the VAX through the commercialized version of the QPI. Control and analysis are supported with the multiwindow graphics capability of the workstation. The relationship between the FASTBUS hardware and the host VAX system, as well as the network environment the couples the various LANSCE instruments together are discussed. The principal features of the FASTBUS hardware and associated data acquisition/analysis software are addressed. 14 refs.

## Computer Simulation

**087814 VECTORIZATION OF THE GEANT3 GEOMETRICAL ROUTINES FOR A CYBER 205.** Simulation studies of high energy physics experiments consume now the largest portion of the CPU time required to analyze an experiment. This is mainly due to the increasing complexity of experimental apparatus and higher energies. We present here the first results from vectorizing the CERN detector simulation code GEANT3. Preliminary vectorization of just the geometrical part of GEANT3 applied to the calorimeter of experiment D0 of Fermilab shows a factor of 3 gain in performance on a Cyber 205. (Author abstract) 9 refs.

Dekeyser, J.-L. (Florida State Univ, Tallahassee, FL, USA). *Nucl Instrum Methods Phys Res Sect A* v A264 n 2-3 Feb 15 1988 p 291-296.

**087815 MONTE CARLO SIMULATION OF A TRANSITION RADIATION DETECTOR.** This paper employs Monte Carlo simulations of the performance of a transition radiation detector (TRD). The program has been written for the TRD in the ZEUS spectrometer, which separates electrons from hadrons in the momentum range between 1 and 30 GeV/c. Both total charge method and cluster counting method were simulated taking into account various experimental parameters. In particular, it was found that the cluster counting method relies on a quantitative understanding of the background originating from the production of  $\delta$ -electrons by charged particles. The results of the Monte Carlo calculations are in agreement with experimental data obtained with prototypes within a systematic uncertainty of 20 percent. We applied our Monte Carlo program to studies in order to find an optimum layout for the TRD within available space in the ZEUS spectrometer. This method of cluster analysing improves the suppression of hadrons by a factor of about two compared to the total charge method. (Edited author abstract) 8 Refs.

**087817 VERSATILE, LOW-COST PYROELECTRIC LASER POWER MONITOR FOR THE 1 mW TO 50 W RANGE.** A design of inexpensive PVDF pyroelectric radiation detectors of large aperture and dynamic range is described. The spectral response ranges from the visible into the FIR region. Constructional and performance details are given. (Author abstract) 10 refs.

Hammerich, Mads (Univ of Copenhagen, Copenhagen, Den); Olafsson, Ari. *J Phys E* v 21 n 1 Jan 1988 p 80-83.

**087818 DESIGN AND REJECTION STUDIES FOR A CYLINDRICAL TRANSITION RADIATION DETECTOR FOR THE UA2 UPGRADE.** A study of a compact and cylindrical transition radiation detector is described. A prototype has been built and tested with 40 GeV electrons and hadrons. The measurements have been done using 100 MHz FADC. We have compared different radiators and chamber geometries using various algorithms. The cluster counting and the total integrated charge methods give comparable results. A comparison between radiators of lithium and polypropylene is made. (Author abstract) 10 refs.

Ansari, R. (Lab d'Accelerateur Lineaire, Orsay, Fr); Chollet, J.C.; De Lotto, B.; Froidevaux, D.; Fayard, L.; Merkel, B.; Iconomidou-Fayard, L.; Moniez, M.; Parrou, G.; Repellin, J.P. *Nucl Instrum Methods Phys Res Sect A* v A263 n 1 Jan 1 1988, Front Detect for Front Phys, Proc of the Third Pisa Meet on Adv Detect, Castiglione della Pescaia, Italy, Jun 3-7 1986 p 51-57.

**087819 HgI<sub>2</sub> ARRAY DETECTOR DEVELOPMENT PROJECT.** We report here on the project's current status. Major effort has occurred in several areas. We have developed techniques for producing multielement arrays on HgI<sub>2</sub> and constructed a testing system to evaluate our initial ideas for miniaturizing the array processing electronics. We have combined fiber optics with pulsed optical resetting in a novel way in order to be able to employ this reset scheme in the physically dense array environment. We present the results of crosstalk

testing using this new scheme, as well as electronic-noise and energy-resolution results on a recently fabricated HgI<sub>2</sub> detector array. Finally, we describe our current progress in eliminating charge division between neighboring detector elements through the use of entrance window masking. (Edited author abstract) 18 refs.

**087820 DESIGN AND PERFORMANCE OF AN IMAGING PLATE SYSTEM FOR X-RAY DIFFRACTION STUDY.** A new readout system for a BaFBr:Eu<sup>2+</sup> photostimulable phosphor screen (imaging plate) was constructed by modifying a drum scanner, with a design optimized for X-ray diffraction and scattering applications. An effort was made to achieve a high detective quantum efficiency below 20 keV, a small pixel size (25  $\mu\text{m} \times 25 \mu\text{m}$ ), a low quantization noise (0.22%) using 12-bit A/D converters, and the capability to cover an inherent dynamic range (1:10<sup>5</sup>) of the photostimulated luminescence by using two photomultiplier tubes. This system is being used in several synchrotron radiation experiments: Laue diffraction of protein crystals, small angle diffraction from a single muscle fiber, powder diffraction from crystals in a diamond anvil cell, and time-resolved small-angle X-ray scattering from a synthetic polymer during stretching. (Author abstract) 15 refs.

Efficiency See Also GAMMA RAYS—Detection.

**087821 EFFICIENCY OF Si(Li) X-RAY DETECTORS AT LOW ENERGIES.** A method for determining the efficiency of a Si(Li) X-ray detector at low energies using a fluorescence X-ray source is described. The thickness of the Be X-ray window and of the Si dead layer can also be measured. Results obtained using the method are described and the effects of the gold contact and of a possible ice layer on the surface of the detector considered. (Author abstract) 12 refs.

**087822 EMPIRICAL RELATION BETWEEN EFFICIENCY AND VOLUME OF HPGe DETECTORS.** F. Vano et al.'s empirical relation has been proved to be valid for HPGe detectors with large active volume range. New values of  $a$  and  $b$  are 0.6246 and -2.136 respectively. The slope of the efficiency curve is characteristic of detectors and independent of the geometry conditions within 2% error. It can be calculated within an error less than 3% in a certain energy range. (Author abstract) 3 refs.

Zhong, Cao (Inst of Atomic Energy, Beijing, China). *Nucl Instrum Methods Phys Res Sect A* v A262 n 2-3 Dec 15 1987 p 439-440.

**087823 COMPUTER PROGRAM FOR CALCULATING Ge(Li) DETECTOR COUNTING EFFICIENCIES WITH LARGE VOLUME SAMPLES.** A novel computing method has been developed to calculate the absolute photopeak efficiency of a Ge(Li) detector for cylindrical samples of different heights and diameters with variable density. For each point in the cylindrical sample the detection efficiency is calculated taking into account the distance from the detector and gamma ray attenuation and the efficiency is integrated numerically over the volume of the sample. The detector is approximated as a point detector with an experimentally determined effective

interaction depth. It is necessary to measure the absolute efficiency for a point source located on the detector axis at a known distance. Then the computer program calculates the absolute counting efficiency for any cylindrical sample and for any density. The measured and calculated values for two different cylinders and three different densities give a good (—12%) overall agreement. (Author abstract) 11 refs.

**087824 ABSORPTION EDGE TECHNIQUE FOR DETERMINATION OF INTRINSIC Ge DETECTOR PARAMETERS.** A systematic study of the intrinsic Ge detector efficiency in the energy region 2-20 keV is presented. The definition of the efficiency is discussed and auxiliary quantities introduced. The most influential construction parameters of the detector - the dead layer width and the thickness of the gold contact - are determined in separate measurements employing the differential counting technique in the vicinity of respective absorption edges. A simple analytical approximation to the efficiency is proposed. (Author abstract) 25 refs.

Electronic Equipment See Also RADIOACTIVITY MEASUREMENT; SPECTROMETERS—Components.

**087826 DATA ACQUISITION SYSTEMS FOR LINEAR AND AREA X-RAY DETECTORS USING DELAY LINE READOUT.** Digital systems for fast readout of linear and area position sensitive detectors based on commercially available CAMAC modules are described. The first version of the system has been used extensively for synchrotron radiation work carried out at the EMBL outstation in Hamburg during the last five years. A second system allowing measurements at count rates up to 600 kHz on a continuous source has been recently installed. An overview of the complete acquisition and information processing system is also given. (Author abstract) 37 refs.

**087827 ENGINEERING TRADEOFFS IN MINIATURIZATION OF ELECTRONICS FOR VERY LARGE DETECTORS.** The author points out that very-large-scale detectors require a level of highly disciplined engineering if they are to be built within time and budgetary constraints, and that an excessive level of innovation in the design can be a hindrance rather than an advantage toward the chief end. He explores the issue of

how to judge the level to which electronics technology should be introduced into a detector design. He examines the cost/benefit tradeoffs.

Larsen, R.S. (Stanford Univ, CA, USA). *IEEE Trans Nucl Sci* v 35 n 1 Feb 1988, 34th Nucl Sci Symp, San Francisco, CA, USA, Oct 21-23 1987 p 138-141.

**087828 HYBRIDIZED FRONT END ELECTRONICS OF THE CENTRAL DRIFT CHAMBER IN THE STANFORD LINEAR COLLIDER DETECTOR.** A description is given of the front-end electronics, which has been hybridized in order to accommodate high-packaging-density requirements. The hybrid package contains eight channels of amplifiers together with all the associated circuits for calibration, event recognition, and power-economy switching functions. A total of 1280 such hybrids are used. The amplifiers and associated circuits are described, and their performance is discussed. 8 refs.

Lo, C.C. (Lawrence Berkeley Lab, Berkeley, CA, USA); Kirsten, F.A.; Nakamura, M.; Jared, R.C.; Goulding, F.S.; Yim, A.; Moss, J.; Freytag, D.; Haller, G.; Larson, R.; Peregny, L. *IEEE Trans Nucl Sci* v 35 n 1 Feb 1988, 34th Nucl Sci Symp, San Francisco, CA, USA, Oct 21-23 1987 p 142-145.

## Evaluation

**087829 COMPARISON OF THREE DETECTORS FOR SOFT X-RAY DOSIMETRY.** Three methods of X-ray dosimetry were tested and compared for broadband synchrotron radiation in the photon energy range 500-6000 eV. A calorimetry technique using thermistors as both the temperature-sensing device and the radiation absorber was easy to implement and gave reproducible results. Radiochromic film was convenient to use and agreed with the calorimetry results, but with more scatter in the measurements. The formation of color centers (F-centers) in alkali halide crystals, specifically NaCl and LiF, provided interesting results but requires further research for the application to low energy synchrotron radiation. (Author abstract) 10 refs.

## Imaging Techniques

**087830 DELAY LINE READOUT OF MICROCHANNEL PLATES.** A two-dimensional delay line readout to be used with large-diameter (127-mm) microchannel plates (MCPs) has been developed. High spatial resolutions (25  $\mu$ m FWHM for an MCP gain of  $2 \times 10^7$ ) and excellent linearity of position readout (less than  $\pm 65$ - $\mu$ m deviation from linearity) have been achieved in a test setup using 30-mm-diameter MCPs coupled to 140-mm  $\times$  140-mm delay lines. Single-pass delays of only 176 ns allow system deadtimes of less than 1  $\mu$ s. This type of readout will be applied to imaging X-ray detectors to be used in protein crystallography. 11 refs.

**087831 DETECTION OF IONIZING RADIATIONS BY NATURAL AND SYNTHETIC DIAMOND CRYSTALS AND THEIR APPLICATION AS DOSIMETERS IN BIOLOGICAL ENVIRONMENTS.** Experimental results demonstrate that synthetic diamond crystals with impurity concentrations carefully controlled during the synthesizing process are excellent ionizing radiation detectors in instances of in vivo radiation dosimetry. Because of their size and physical properties, synthetic diamond crystals would

lend themselves to electron beam dosimetry measurements in radiotherapy units. With slight modifications to the synthesizing process, the diamonds can be used as thermoluminescence dosimeters or as ionization chamber dosimeters. The nontoxic, tissue-equivalent diamond crystal dosimeters can be reused many times. (Edited author abstract) 30 refs.

## Medical Applications

**087832 PROCEEDINGS OF THE INTERNATIONAL SYMPOSIUM ON THE USE OF WIRE CHAMBERS IN MEDICAL IMAGING.** This conference proceedings contains 16 papers, all of which are separately indexed and abstracted. The papers consider topics on the use of wire chambers in medical imaging. Positron cameras are reviewed. Applications of proportional chambers, gamma cameras, and X-ray detectors are presented. Digital imaging, positron emission tomography, medical imaging, and image enhancement are discussed. Technical and professional papers from this conference are indexed and abstracted with the conference code no. 11653 in the Ei Engineering Meetings (TM) database produced by Engineering Information, Inc.

## Performance See Also GEOPHYSICS—Exploratory; RADIOACTIVITY MEASUREMENT—Reliability.

**087833 SELECTION OF CRITERIA FOR ESTIMATION OF THE SPECTRAL SENSITIVITY OF A SET OF INTEGRAL DETECTORS.** The authors describe and study with test spectra a form for quantitative estimation of the spectral sensitivity of integral detectors that is based on specially determined coefficients of spectral sensitivity of individual detectors and the set as a whole. The authors also consider the possibility of organization - with the use of coefficients of spectral sensitivity - of a simple procedure for determining spectrum errors due to measurement-means errors that is easily implemented on small computers. The experimental results lead to the general conclusion that the proposed approach to estimation of the spectral sensitivity of a set of detectors shows good promise for practical application in the integral-detector method, although a number of its aspects require further development and improvement. 7 refs.

**087835 ONE-DIMENSIONAL ARRAY BASED ON Si(Li) DETECTORS FOR SCANNING X-RAY INTROSCOPES.** Si(Li) diffusion-drift semiconductor detectors (SD) are studied that are designed for one-dimensional multielement arrays for scanning x-ray introsopes. The working area of the detectors is  $10 \text{ mm}^2$ , and the thickness of the sensitive region is 22 mm. The

working range of dose rates is 0.05-10 R/min for radiator voltages of 100-120 kv. The SD sensitivities are 0.5 and  $0.65 \mu\text{A}/\text{cm}^2$  (R/min) for 100 and 120 Kv, respectively. The signal-to-noise ratios of the sensor (SD and operational amplifier), the temperature dependence of the sensor signals, and the effect of scattered radiation on the SD signal are studied. A detector module consisting of 16 elements is described. (Author abstract) 7 refs.

**087836 EXTENSION OF THE SEMIEMPIRICAL GERMANIUM DETECTOR RESPONSE FUNCTION TO LOW ENERGY GAMMA RAYS.** A model for the spectral response function of large volume germanium gamma-ray detectors in the range of incident gamma-ray energies from 60 keV to 6.2 MeV has been developed and applied to a 39% high purity germanium detector. Functional forms for describing the various features of the response function are based either on empirical functions or on analytical expressions of the interaction mechanisms. Improved functions are formulated to give good agreement to the experimental spectra near the Compton edge in the Compton continuum of the primary and annihilation photons. To form the complete detector response function only nine linear and six nonlinear parameters are needed. Validity of the model is demonstrated by comparing the regenerated spectra of  $^{241}\text{Am}$ ,  $^{51}\text{Cr}$ ,  $^{137}\text{Cs}$ ,  $^{54}\text{Mn}$ ,  $^{28}\text{Al}$ ,  $^{37}\text{S}$ , and  $^{16}\text{N}$  and the synthesized spectra of  $^{24}\text{Na}$  and  $^{133}\text{Ba}$  using the response function to the equivalent experimental spectra. (Author abstract) 11 refs.

**087837 DETERMINATION OF THE DYNAMIC NONLINEARITY OF SEMICONDUCTOR AND COMBINED DETECTORS FOR COMPUTER-ASSISTED TOMOGRAPHY.** The experimental arrangement described reproduces values of the x-ray photon flux density that are typical of computer-assisted tomography ( $10^8$ - $10^{10} \text{ cm}^{-2} \cdot \text{sec}^{-1}$ ) and its rates of relative change. We give the results of determination of the dynamic nonlinearity  $\gamma^d$  of combined detectors [ $\text{CsI(Tl)} + \text{Si}$  photodiode and  $\text{CdWO}_4 + \text{FEU-60}$  photomultiplier] and semiconducting CdTe. The CdTe detector has the highest value,  $\gamma^d \geq 36\%$ , while  $\text{CdWO}_4 + \text{FEU-60}$  has the lowest values,  $\gamma^d \leq 1\%$ , on the trailing edge of the current signal. (Author abstract) 7 refs.

**087838 SILICON DETECTORS FOR NUCLEAR RADIATION.** The working principle of Si radiation detectors is described, choosing a  $p^+nn^+$  structure as a typical device. The physical laws for interaction of corpuscular and gamma radiation with matter are discussed and the conditions for energy spectroscopy derived. For position determination of radiation, resistive charge division, integrated diode arrays, charge drift and charge transfer in CCDs are considered. The need for nuclear radiation detectors in research and technology is demonstrated. (Author abstract). 31 Refs.

Kemmer, Josef A. (Technical Univ Munich, Garching, West Ger). *Sens Actuators* v 15 n 2 Oct 1988 p 169-184.

**087839 SEMICONDUCTOR DETECTOR PERFORMANCE FOR LOW-ENERGY X-RAYS.** Factors that limit the capabilities of semiconductor detectors at photon energies below 5 keV include energy resolution, detector efficiency, and detector-related continuum background. These properties can be controlled to a certain extent by optimal detector design and fabrication tech-

niques. We describe measurements on the low energy response of Si(Li) detectors obtained using a tunable monochromatic source. Window thicknesses have been measured for a number of devices using different materials for the entry contact. The interpretation of these results in terms of existing detector window models is discussed. Results obtained using a new contact structure demonstrate that a dramatic reduction in window-related absorption in Si(Li) detectors can be achieved. (Author abstract) 6 refs.

#### Research See Also PHYSICS—High Energy.

**087840 MILLIMETER AND SUBMILLIMETER DETECTION USING  $Ga_{1-x}Al_xAs/GaAs$  HETEROSTRUCTURES.** We have shown that a  $Ga_{1-x}Al_xAs/GaAs$  heterostructure can be used as a sensitive tunable detector of mm-wave/sub-mm-wave radiation. The mechanism for detection requires the application of a magnetic field varying from approximately 0.2T at 94GHz (3.2mm wavelength) to 6.2T at 2500GHz (119μm wavelength). The responsivity and N.E.P. at 3.2mm have been roughly estimated at 200V/W and  $5 \times 10^{-11}W/\sqrt{Hz}$  respectively. (Edited author abstract) 10 refs.

#### Reviews

**087841 RECENT RESULTS FROM THE FREJUS EXPERIMENT.** Recent results from the Frejus experiment are discussed. Besides giving new limits on the nucleon lifetime we report on searches for Cygnus X3, SNA 1987a and dark matter induced events. In addition we present an analysis of the muon multiplicity deep underground in terms of the primary cosmic ray composition. (Author abstract) 8 refs.

**087842 D0 TRANSITION RADIATION DETECTOR.** The transition radiation detector (TRD) for the D0 experiment is currently under construction at SLAC. The first part of this paper reports on the tests performed with a prototype detector at the CERN PS. Chamber operation was studied with xenon gas and small additions of  $CO_2$ ,  $CH_4$ , or isobutane as quenchers. X-ray yields from lithium and polypropylene radiators were compared, with different analysis methods. The second part describes the design and construction of the cylindrical TRD, to be built and installed in the D0 Experiment (E740) at FNAL, which should provide a pion rejection factor of 50 for 90% electron efficiency. The first chamber of this 3-unit detector will be ready for test in April 1987, and the full TRD is planned to be assembled at the end of 1987. (Author abstract) 3 refs.

#### Testing

**087843 TEST OF A  $BaF_2$ -TMAE DETECTOR FOR POSITRON-EMISSION TOMOGRAPHY.** A detector consisting of  $BaF_2$  scintillators and wire chambers has been tested for 511 keV gamma-rays. The wire chamber is filled with photosensitive tetrakis(dimethylamine)ethylene

(TMAE) vapour and is operated at a pressure of a few Torr, using different gases at various temperatures. Energy, time, and position resolutions are given for  $BaF_2$  crystals with sections of  $10 \times 10$  mm<sup>2</sup> and  $5 \times 5$  mm<sup>2</sup>. We discuss the potential of this gamma detector for positron-emission tomography (PET) and compare it with other systems. (Author abstract) 19 refs.

#### Thin Films

**087844 PHOTOMETRIC METHOD OF DETERMINING GOLD FILM THICKNESS OF NUCLEAR RADIATION SILICON DETECTORS.** The input window thickness of nuclear radiation silicon detectors (SFD) containing the surface barrier (Schottky barrier) is one of the most important characteristics of the primary transducer. The parameter is determined mainly by the thickness of the sputtering gold film. Since the radiometric properties of a detector, and in some cases, the applicability of the detector in principle, depend on the thickness of its input window, it is very important to know this parameter for each detector. A photometric method of assessing a detector's gold film thickness based on the photocurrent from a light passed through the sputtered metal layer is discussed. 3 refs.

**087845 APPLYING TELLEGEN'S THEOREM TO CALCULATE THE PULSE RESPONSES ON A MICROSTRIP DETECTOR'S STRIPS.** The pulse response on a strip of a microstrip detector is calculated while charge, generated in the detector by radiation, is being collected. Both cases, i.e., when the strip is going to collect the generated charge and when it does not, are evaluated. A method to calculate these pulses is presented. It is based on Tellegen's theorem by which it is shown that the current induced in a detector strip can be calculated by scaling the currents flowing inside the detector (resulting from the movement of the generated charges) by a reference field and then integrating these weighted currents. This field, which is determined separately, depends solely on the geometry of the detector. Its generality makes the method applicable to other induction problems as well. 12 refs.

**087846 DEVICE FOR IRRADIATING SAMPLES AT A LOW TEMPERATURE.** The processes taking place in various samples in an intense flux of nuclear radiation at a low temperature are studied in devices of the end 'loop', operating on liquid nitrogen. The loops consist of a liquid-nitrogen source, a cryostat holding the samples, inlet and outlet lines, and a radiation source. Such a device is designed to work only on expensive super-pure nitrogen. At the Institute of Mechanical Engineering of the Ukrainian Academy of Sciences, a new system for the low-temperature irradiation of samples was developed and tested. In this system the main coolant can be inexpensive industrial nitrogen, which has a composition satisfying GOST (All-Union State Standard) 9293-74 (96% nitrogen, 4% oxygen). 2 refs.

**087847 FEDERAL APPROACH TO RADIATION ISSUES.** Formal interagency coordination action on radiation issues began with the creation of the Federal Radiation Council (FRC) in 1959 'to advise the President with respect to radiation matters.' The FRC then consisted of representatives of six federal agencies. When EPA was created in 1970, the FRC was abolished and many of its functions were transferred to EPA. Today representatives from those six agencies as well as 12 others comprise the Committee on Interagency Radiation Research and Policy Coordination (CIRRPC). This article discusses issues addressed by CIRRPC. Subjects covered include federal radiation policy, radiation compensation, radon, nonionizing radiation, food irradiation, and others. 17 Refs.

**087848 DIRECT EFFECTS OF IONIZING RADIATION UNIQUE TO MACROMOLECULES.** Radiation studies of macromolecules have revealed several effects which cannot be described by classical radiation physics and are not observed in radiation studies of simple diatomic gases: (1) the radiation damage to macromolecules depends on the temperature at which irradiation was performed; (2) polymeric molecules suffer radiation damage throughout the chain no matter where the primary ionization occurred; (3) there is only minimal appearance of radiation damage in other chains which are not covalently linked to the one suffering the primary ionization. These effects have been observed in radiation studies of all synthetic polymers and biologic macromolecules including proteins and nucleic acids. Data implicating free radicals in the temperature effects and studies concerning energy transfer in irradiated macromolecules provide a basis for the mechanisms involved in these effects. (Author abstract). 55 Refs.

**087849 HIGH ENERGY PHOTOPHYSICS AND PHOTOCHEMISTRY: ASSIGNMENT OF INITIAL ELECTRONIC STATES OF FRAGMENTATION PROCESSES IN  $CO_2^{2+}$ .** The assignment of the electronic states of gas-phase molecular dications presents a number of difficulties. After discussing these problems a strategy for assignment, which collates the results of several experimental and theoretical techniques, is presented. The use of information from the fragmentation dynamics of dication states is proposed. Three states,  $\alpha$ ,  $\beta$  and  $\gamma$ , of  $CO_2^{2+}$ , whose appearance potentials were previously observed by photoion-photoion coincidence techniques at 37.9, 40.5 and 45 eV, respectively, are

assigned using the methods presented. The results also strongly support the value 37.7 eV for the appearance potential of the metastable ground state. Present limitation and future desirable progress of the assignment techniques are discussed. (Author abstract) 47 Refs.

**087850 ESTIMATING THE DIMENSIONS OF THE SEU-SENSITIVE VOLUME.** Simulations of the diffusion contribution to charge collection in SEU (single-event upset) events are carried out under the simple assumption of random walk. The results of the simulation are combined with calculations of the funneling length for the field-assisted drift components to determine the effective thickness of the sensitive volume element to be used in calculations of soft-error rates for heavy-ion-induced and proton-induced upsets in microelectronic circuits. Comparison is made between predicted and measured SEU cross sections for devices for which the critical charges are known from electrical measurements and the dimensions of the sensitive volume used are determined by the techniques described. The agreement is sufficient to encourage confidence that SEU rates can be calculated from first principles and a knowledge of the material, structural, and electrical characteristics of the device. 10 refs.

## Electromagnetic Field Effects

**087852 NEW APPROACH TO VOLUMES IRRADIATED BY UNKNOWN SOURCES.** The authors suggest an approach to the characterization of electromagnetic environments irradiated by unknown sources. The approach is based on the numerical solution of Maxwell's equations subject to the constraints imposed by the measured values of the field at a small number of measurement points and by boundary conditions. A thorough examination of a method for the numerical solution is presented. The examples attempted demonstrate the approach but reveal deficiencies in the numerical method. Possible future directions are suggested. 25 refs.

**Environmental Impact** See NUCLEAR POWER PLANTS—Accidents.

**Health Hazards** See Also RISK STUDIES—Health Risks; ULTRAVIOLET RADIATION—Measurements.

**087853 HUMAN EXPOSURE TO LOW LEVEL IONISING RADIATION.** A review is given of the

ionizing-radiation environment, covering natural and artificial sources. It is seen that with currently-accepted quality factors the progeny of radon-222 make the largest single contribution to human exposure. Medical radiation usage is the greatest artificial source. Stochastic effects of radiation and the usual approach to protection from radiation are discussed briefly. (Author abstract) 22 refs.

**087854 PRENATAL IRRADIATION AND CHILDHOOD CANCER.** Estimates of the relative risk of childhood cancer, following irradiation during fetal life, are reported. They are based upon extended case-control investigations of childhood cancer deaths in England, Wales and Scotland between 1953 and 1979 comprising 14,759 geographically-matched and birth-date-matched case/control pairs. The estimates were calculated using Conditional Logistic Regression (Miettinen-Breslow) techniques. This method of risk-estimation limits the distortion caused by confounding factors or by biased selection of controls. Through analyzing a range of reported exposures other than radiation, levels of general reporting and recording biases between cases and controls were also assessed. During this period of time, about 7 per cent of all childhood cancers, and 8 per cent of those with onset between the ages of 4 and 7 years, were caused by x-ray examinations. The dose-response relationship was one death per 990 obstetric x-ray examinations; or 2,000 deaths per  $10^4$  man-Gy. (Edited author abstract) 21 refs.

## Industrial Applications

See Also DOSIMETRY.

**087855 PROGRESS IN RADIATION PROCESSING, PROCEEDINGS OF THE 6TH INTERNATIONAL MEETING.** This conference proceedings contains 120 papers on the most recent findings in radiation processing and research. The program of the conference provides a balance between industry, government and academia, while ensuring a balance between electron beam and gamma technologies. The main topics discussed include environmental applications, food irradiation, international developments, source technology developments, process control, dosimetry, irradiator design, polymers, biological applications, new applications, and general radiation processing applications. All papers are abstracted separately. Technical and professional papers from this conference are indexed and abstracted with the conference code no. 11109 in the Ei Engineering Meetings (TM) database produced by Engineering Information, Inc.

**087856 RADIATION APPLICATIONS RESEARCH AND FACILITIES IN AECL RESEARCH COMPANY.** There are currently two major industrial uses of ionizing radiation. One of these, sterilization of medical disposables, is based primarily on gamma radiation from  $^{60}\text{Co}$  while the other, curing, polymerizing, crosslinking and grafting of materials is based on machine-produced electron radiation. In the 60's and 70's Atomic Energy of Canada had a very active R&D program to discover and develop applications of ionizing radiation. Out of this grew the technology underlying the company's current product line of industrial irradiators. With the commercial success of that product line the company turned its R&D attention to other activities. Presently, widespread interest in the use of radiation for food processing and the possibility of developing reliable and competitive machine sources of radiation hold out the promise of a major increase in industrial use of radiation. In March 1985 a new branch, Radiation Applications Research, began operations with the objective of working closely with industry to develop and assist the introduction of new uses of ionizing radiation. Initial projects in

areas ranging from food through environmental and industrial applications have been assessed and the most promising have been selected for further work. 19 refs.

## Measurements

**087857 RADIATION MEASUREMENTS AND RADIOECOLOGICAL ASPECTS OF FALLOUT FROM THE CHERNOBYL REACTOR ACCIDENT.** Fallout from the Chernobyl reactor accident has been monitored for about one year in Thessaloniki in Northern Greece. Fifteen different short-lived, three relatively long- and one long-lived fission products were identified in air, precipitation, soil, grass and milk samples. The iodine-131 and cesium-137 concentrations in air reached 6.5 and 3 Bq  $\text{m}^{-3}$  respectively, on 6 May, 1986. The external exposure dose rate rose to five times the normal background level. It was estimated that the accumulated dose equivalent to the adult thyroid from inhaled iodine-131 averaged 96  $\mu\text{Sv}$ , while the body burden from inhaled radioiodine nuclides averaged 2  $\mu\text{Sv}$ , 1000 times lower than that corresponding to the estimated dose equivalent from ingestion of food-stuff, which averaged 2 mSv for the first year after the accident. (Author abstract) 20 refs.

## Safety Codes

**087858 IONISING RADIATIONS REGULATIONS 1985 - IMPLICATIONS FOR THE RECORDING AND MONITORING OF PERSONAL RADIATION DOSES.** The Ionizing Radiations Regulations 1985, which came fully into operation on 1st January 1986, provide a coherent set of requirements for all forms of work with ionizing radiation. Of particular importance to many employers have been the changes in dose concepts, and hence in the requirements for the recording and monitoring of internal radiation doses, consistent with the principles of ICRP Publication 26. This paper describes those changes against the background of the previous UK requirements under the Nuclear Installations Act and the subsequent practical issues involved in demonstrating compliance. (Author abstract) 9 refs.

## Spectrum Analysis

**087859 COMPARISON OF ONETRAN CALCULATIONS OF ELECTRON BEAM DOSE PROFILES WITH MONTE CARLO AND EXPERIMENT.** Electron beam dose profiles have been calculated using a multigroup, discrete-ordinates solution of the Spencer-Lewis electron-transport equation. This was accomplished by introducing electron-transport cross sections into the ONETRAN code in a simple manner. The purpose is to 'benchmark' this electron-transport model and to demonstrate its accuracy and capabilities over the energy range from 30 keV to 20 MeV. The results are compared with the measurements and TIGER Monte Carlo data published by G. J. Lockwood et al. (1980). In general, the ONETRAN results are smoother, agree with TIGER within the statistical error of the Monte Carlo histograms, and require about one-tenth the running time

of the Monte Carlo method. 17 refs.

**087860 TWO-DIMENSIONAL TRANSPORT EQUATION CALCULATIONS OF DOSE PROFILES DUE TO ELECTRON BEAM IRRADIATION.** The Spencer-Lewis equation for kilovolt electron transport in two dimensions was solved using a discrete-ordinates, diamond difference method. Calculations of dose profiles in 2-D were made for 200-keV electrons normally and isotropically incident on aluminum, and are compared with ACCEPT Monte Carlo calculations. Isodose contour plots are presented for 200-keV electrons making angles of 0° and 45° with the normal. Running times compare favorably with Monte Carlo. 10 refs.

**087861 BINARY COLLISION CASCADE PREDICTION OF CRITICAL ION-TO-ATOM ARRIVAL RATIO IN THE PRODUCTION OF THIN FILMS WITH REDUCED INTRINSIC STRESS.** It is well established that ion beam assisted desposition produces thin films that are more dense and contain less intrinsic stress than films deposited without energy input from an ion beam. In some cases, a critical ion-to-atom arrival ratio has been measured, above which the stress is reduced. We have calculated this critical arrival ratio using the binary collision approximation to simulate collision cascades. Good agreement with data in the literature is obtained by making the assumption that each deposited atom must lie within the volume affected by an ion induced cascade. This model is simple to implement and should provide predictive capability for other covalently bonded systems. (Author abstract) 29 refs.

**087863 DATA FOR USE IN PROTECTION AGAINST EXTERNAL RADIATION.** This report updates the ICRP Publication 21 (1973) by taking account of subsequent reports and data. Its objectives is to provide information and advice on the relationships between radiometric, dosimetric and radiation protection quantities for external radiation and on their practical utilization. The recommendations of the ICRP on limiting exposure to external radiation are collected in Section 2, and definitions of quantities and units are presented in

Appendix A. Methods of determining dose distributions are discussed in Section 3 with special attention paid, in Appendix B, to transport calculations. Section 4 contains a compilation of recommended data for interconverting the various radiation quantities in circumstances of idealized irradiation geometry, and there are supporting data on doses to organs in Appendix C. In Section 5, advice and information are offered on the application of the coefficients in practical circumstances; the use of the index, environmental, and individual quantities is discussed in Appendix D. Refs.

**087864 MEASUREMENT - A KEY TO THE SAFE USE OF IONISING RADIATION.** With the increasing industrial use of ionizing radiations, health and safety have become matters of general interest. Dose limits for the safe use of radiation are set internationally and in the UK, the National Physics Laboratory provides the standards which are the basis of protection measurements. (Edited author abstract)

**087865 RADIATION SHIELDING CALCULATIONS FOR A 70- TO 250-MeV PROTON THERAPY FACILITY.** Neutron shielding calculations for a 70- to 250-MeV proton cancer therapy facility have been carried out using the High Energy Transport Code and the one-dimensional discrete ordinates code ANISN. Calculations were performed for iron and water targets with incident proton energies of 150, 200, and 250 MeV. The angular dependence of the neutron spectrum was taken into account by averaging and reporting the spectrum in angular bins of 0 to 15, 15 to 30, 30 to 45, 45 to 60, 60 to 90, and 90 to 180 deg relative to the forward direction of the protons. Each of these various spectra was used as the source spectrum for an individual ANISN run in which the source was placed at the center of a sphere of typical concrete (i.e., density of 2.3 g/cm<sup>3</sup>) and the dose equivalent per proton was calculated as a function of radius. (Edited author abstract) 11 refs.

**087866 PERSONAL DOSIMETRY AND THE NEW QUANTITIES IN RADIATION PROTECTION.** In ICRU Report 39, new quantities for environmental and individual monitoring are recommended which apply to all kinds of ionizing radiation. Whereas the quantities for environmental monitoring do not appear to pose serious problems, the quantities for individual monitoring raise questions as to the required spectral and angular response of monitors and the calibration procedures. It would be logical to use the directional dose equivalent as the reference quantity for their response. The relations between the new ICRU quantities and those used hitherto are discussed. Conversion functions between air kerma or neutron fluence and the new quantities are reproduced. (Edited author abstract) 23 refs.

Wagner, Siegfried R. *PTB Mitt* v 98 n 1 Feb 1988 p 45-51.

**087867 ADEQUATE RADIATION PROTECTION: A LINGERING PROBLEM.** In response to the increasing reports of significant incidents, IAEA Director General Dr. Hans Blix announced in September 1984 the creation of Radiation Protection Advisory Team (RAPAT) to assist Member States in assessing the existing state of their radiation protection activities and in determining their immediate and future needs. RAPATs generally consist of recruited internationally recognized experts and IAEA staff. The team expertise covers a wide range of areas from regulation to operational activities to allow for up-to-date advice on all matters involving ionizing radiation. The RAPAT experience so far unambiguously establishes that many developing countries simply lack the necessary infrastructure to implement a radiation protection policy based on international standards.

**087868 SOIL: A RADIATION SHIELDING MATERIAL.** To support the use of soil as a suitable radiation protection material, the effects of soil grain size and pressure on  $\gamma$ -ray attenuation have been tested in the energy region from 279 to 1250 keV. The variation in linear - and mass - attenuation coefficients,  $\mu$  and  $\mu_m$ , with soil grain diameter is found appreciable and independent of soil chemical composition. The increase of  $\mu$  with pressure is only up to  $10^4$  kg/cm<sup>2</sup> pressure for soil particles of uniform grain size  $d=0.12 \pm 0.03$  mm. However, no significant change is seen in  $\mu_m$  with pressure. The half-thickness values for attenuation were calculated from present data have also been discussed for different  $\gamma$  radiations. (Author abstract) 13 refs.

**087869 OPTIMISATION OF RADIATION PROTECTION IN THE HEALTH SERVICE.** Accurate information is hard to come by regarding the collective doses received by patients and staff as a result of medical exposures. Data taken from the 1984 NRPB review indicates that action should be taken to reduce all doses particularly those to patients. Reference is made to a number of publications showing that doses received by patients in diagnostic procedures could be optimized. On the other hand whilst doses received by patients in therapeutic procedures cannot be reduced without reducing the effectiveness of treatment, attention has been directed to using optimization techniques to justify dose reduction to nursing staff. It is concluded that optimization techniques are neither generally used nor generally useful. Other hazards and other priorities have to be taken into account in allocating available resources. (Edited author abstract) 12 refs.

**Quality Control**

**087870 TECHNICAL NOTE: THE QUALITY FACTOR IN RADIATION PROTECTION.** Since the introduction of the concept of dose-equivalent, there has been a continuing debate on the parameters of this concept. In 1980 the International Commission on Radiological Protection (ICRP) and the International Commission on Radiation Units and Measurements (ICRU) established a Joint Task Group on Radiation Protection Quantities. The immediate reasons for this step were recent biological findings indicating that protection recommendations for some high-LET (linear energy transfer) radiations might not offer the same margin of safety as those for low-LET radiations. The Task Group's report is primarily focused on the problem of radiation quality and its quantitative treatment in radiation protection. The ICRU's report, the Quality Factor in Radiation Protection, is an attempt to summarize and clarify issues that surround the concept and quantifications of the quality factor. 2 refs.

### Computer Aided Design

**087871 ON OPTIMAL MATHEMATICAL DESIGN OF HIGH-TEMPERATURE RADIATORS.** A variant regularization method has been used to solve the inverse problem of radiative heat exchange between two smooth surfaces, one (the surface of the heater) being flat. The problem was considered in the following formulation: the field of temperatures and fluxes of resultant radiation at the surface of the product is specified while the temperature field of the heater is unknown. The generalized discrepancy principle for nonlinear improper problems was used to construct a regularizing function whose value is proportional to the energy of the heater self-radiation. Introduction of such a functional makes it possible to make the solution stable and to optimize the heater temperature field so as to minimize heat losses in the radiating system. (Author abstract) 5 refs.

**Efficiency** See HEAT TRANSFER—Radiation.

**Heat Transfer** See ELECTRIC TRANSFORMERS.

### Performance

**087872 EVALUATION OF SPACE RADIATOR PERFORMANCE BY SIMULATION OF INFRARED EMISSION.** The total performance of a droplet space radiator has been predicted by simulation of infrared emission spectra. Emission spectra for a droplet are simulated with the use of exact optical theory from the optical constant spectra of a low-molecular-weight silicone, which is a candidate for use as an emission medium of the radiator. Emissive power and total emittance are calculated from the simulated emission spectra for a droplet at different temperatures. It is found that the fourth-power temperature dependence of the emissive power of the blackbody and the temperature dependence of the emissivity inherent to the materials govern the emissive power of the droplet. (Edited author abstract) 13 refs.

**Space Applications** See Also SPACECRAFT—Heat Transfer.

**087873 LIQUID SHEET RADIATOR.** A new external flow radiator concept, the liquid sheet radiator (LSR), is introduced. The LSR sheet flow is described and an expression for the length/width  $L/w$  ratio is presented. A linear dependence of  $L/w$  on velocity is predicted that agrees with experimental results. Specific power for the LSR is calculated and is found to be nearly the same as the specific power of a liquid droplet radiator, (LDR). Several sheet thicknesses and widths were experimentally investigated. In no case was the flow found to be unstable. (Author abstract) 14 refs.

Chubb, Donald L. (NASA, Cleveland, OH, USA); White, K. Alan III. *NASA Tech Memo* 89841 1987 11p.

**087874 LIQUID DROPLET RADIATOR DEVELOPMENT STATUS.** Development of the Liquid Droplet Radiator (LDR) is described. Significant published results of previous investigators are presented, and work currently in progress is discussed. Several proposed LDR configurations are described, and the rectangular and triangular configurations currently of most interest are examined. Development of the droplet generator, collec-

tor, and auxiliary components are discussed. Radiative performance of a droplet sheet is considered. The collision of droplets in the droplet sheet, the charging of droplets by the space plasma, and the effect of atmospheric drag on the droplet sheet are shown to be of little consequence, or can be minimized by proper design. The effect of atmospheric drag on a droplet sheet can also be minimized with proper design. The LDR is seen to be less susceptible than conventional technology to the effects of micrometeoroids or hostile threats. Methods for reducing spacecraft contamination from an LDR to an acceptable level are discussed. Preliminary results of microgravity testing of the droplet generator are presented. (Edited author abstract) 49 refs.

**087875 HIGH TEMPERATURE RADIATOR MATERIALS FOR APPLICATIONS IN THE LOW EARTH ORBITAL ENVIRONMENT.** Radiators must be constructed of materials which have high emittance in order to efficiently radiate heat from high temperature space power systems. In addition, if these radiators are to be used for applications in the low Earth orbital environment, they must not be detrimentally affected by exposure to atomic oxygen. Four materials selected as candidate radiator materials (304 stainless steel, copper, titanium-6% aluminum-4% vanadium (Ti-6%Al-4%V), and niobium-1% zirconium (Nb-1%Zr)) were surface modified by acid etching, heat treating, abrading, sputter texturing, electrochemical etching, and combinations of the above in order to improve their emittance. (Edited author abstract) 9 refs.

### Temperature Control

**087876 ELEKTRONISCHE HEIZKOERPER-REGELUNG.** [Electronic Control of Radiators]. The requirement of higher energy efficiency has promoted the installation of temperature control systems for individual rooms, even for central heating systems. The following systems are available: Thermostat valves for radiators: As a rule, with temperature control via reference values and with manual operation for constant temperature selection. The valves are commonly actuated by expansion elements. Remote-controlled temperature control systems for individual rooms with accurate temperature adjustment via potentiometers, operated either from within the room or from a central control panel, either manually or on the basis of programmed temperature and time values. These systems are recommended if rooms are used for different purposes and for overnight temperature reduction. Older systems usually had automatic control elements only for the heat source. Today, control systems for all individual rooms are available. The RAUMTRONIC electronic radiator control system is described. (Author abstract). 5 Refs. In German.

tion; RADIO SYSTEMS, MOBILE; RADIO SYSTEMS, MOBILE—Cellular Technology; TELECOMMUNICATION—Canada; TELECOMMUNICATION LINKS, MICRO-WAVE—Legislation; TELECOMMUNICATION LINKS, RADIO—Planning; TELEVISION BROADCASTING—Planning.

**087878 FREQUENCY PLANNING FOR MOBILE RADIO IN THE FUEL AND POWER INDUSTRIES.** After a description of the use of mobile radio in the fuel and power industries, the development of mobile networks over the period 1956-1979 is examined. This examination is concluded by describing a processor-based management system which was introduced to improve channel efficiency. Changes to the International Frequency Allocation Table require the fuel and power industries to move mobile services to a new frequency band and the design requirements for a regular frequency re-use strategy are discussed. Methods of dealing with the traffic densities found in the major urban areas are considered, together with the development of a computer aid for network planning. (Edited author abstract)

**087880 BERUECKSICHTIGUNG VON UKW-EINSTREUSIGNALEN BEI DER FREQUENZPLANUNG VON BREITBANDVERTEILNETZEN.** [Taking into Consideration VHF Crosstalk Signals for Frequency Allocation of Wideband Distribution Networks]. A calculation method is described which makes it possible to determine noisy VHF channels due to crosstalk. A relationship is derived between the off-air field strength of radio signals and the minimal necessary rf level of the wanted signals of the broadband distribution network. An illustrative example shows that about 25% of 204 available VHF channels are subject to crosstalk. In German. 12 refs.

Nold, Bruno. *Tech Mitt PTT* v 65 n 9 1987 p 430-434.

**087881 OVERALL FRAMEWORK OF SPECTRUM MANAGEMENT INTERNATIONALLY AND IN THE UK.** There is a worldwide requirement for frequency allocations to be agreed internationally through the mechanism of World Administrative Radio Conferences of the International Telecommunications Union. The output is a Table of Frequency Allocations contained in Article 8 of the International Radio Regulations. The need for more co-operation in frequency allocation matters in Western Europe in order to harmonize frequency provisions for some radio services is increasing; however, at a national level there will remain the need and scope for more detailed planning. In the future, managers of the radio spectrum at the international level will have to cope with the rapid growth in radiocommunications services and the development of new technologies. (Edited author abstract). 2 Refs.

Goddard, M. (Dep of Trade & Industry, London, Engl). *J Inst Electron Radio Eng* v 58 n 4 Jun 1988 p S2-S5.

**087882 SPECTRUM AND ORBIT RESOURCE MANAGEMENT FOR THE FIXED SATELLITE SERVICE.** The Fixed Satellite Service operates in areas of the frequency spectrum which are established by the ITU and are limited due to technological factors and availability. As more systems become operational, congestion will be inevitable and it is essential that regulatory procedures are used to ensure adequate protection of systems from unacceptable levels of interference whilst at the same time introducing efficient use of the limited spectrum/orbit resources such that access to them is assured and in an

equitable manner. This challenging task has been handled in an evolutionary manner within the ITU Radio Regulations over a number of years. This paper describes the current regulatory arrangements and the plans for further evolution of the management system in the near future. Examples of interference analysis are given to add practicality to a complex subject. (Author abstract). 5 Refs.

Thompson, P.T. (British Telecom Int, London, Engl). *J Inst Electron Radio Eng* v 58 n 4 Jun 1988 p S6-S14.

**087883 MANAGEMENT OF BROADCAST ANCILLARY SERVICES.** Planning and administration of allocations is devolved to a user group set up jointly by the UK Broadcasters. This group is known as the Broadcasters' Joint Frequency Management Group (JFMG). This paper outlines the events and considerations that led to the recommendation for frequency management by a user group. It looks at some of the users' service needs and the frequency solutions adopted. Briefly described is the computer data base system adopted by the group which keeps records of numerous allocations shared by many users throughout the country. (Edited author abstract). 9 Refs.

**087884 FREQUENCY MANAGEMENT AND SPECTRUM UTILIZATION FOR HF BROADCASTING.** The background to frequency usage in High Frequency Broadcasting (HFBC) is briefly reviewed, with a description of the current HFBC regulatory procedures and the frequency management associated with an HF Broadcast Service. A brief history of past attempts at planning the HFBC spectrum up to the present day is given including the most recent activities which began in 1979 and culminated in the second session of the WARC HFBC in March 1987. (Author abstract). 4 Refs.

Davey, I.E. (BBC External Services Engineering, London, Engl). *J Inst Electron Radio Eng* v 58 n 4 Jun 1988 p S38-S44.

**087885 FREQUENCY ALLOCATION FOR A MOBILE RADIO TELEPHONE SYSTEM.** Several ways of allocating frequencies efficiently are suggested that are based on the use of Latin squares. A Latin square of order  $n$  is a square array of  $n$  rows and  $n$  columns, and involving  $n$  symbols each of which occurs  $n$  times within the square in such a way that all the different symbols occur once in each row and once in each column. This approach provides two alternative ways of arranging the transmitters for a mobile radio telephone system, one rectangular and the other close-packed hexagonal. In both cases optimal patterns for frequency allocation result. A solution using the least-possible number of frequencies for each case is given, as well as one that is ideal in the sense that all the transmitters that surround any particular one are provided with distinct frequencies. 8 refs.

**087886 MANAGEMENT OF THE RADIO SPECTRUM TO ACHIEVE MORE EFFICIENT UTILIZATION, ACCESS, AND NETWORK GROWTH.** The radio frequency spectrum in nontechnical terms is a valuable, highly contested natural resource. In the most simplistic terms it can be viewed as the central nervous system of our businesses. It is a key element in national security, provides for world-wide communications, and supports scientific ventures beyond our planet and solar system. (Author abstract)

## Monitoring

**087889 NEW TRENDS IN RADIOMONITORING.** Recent progress in technology and improved measuring methods offer an attractive solution for monitoring. Up-to-date receiving systems together with digital signal processing may be used to form universal monitoring equipment which incorporates the conventional monitoring functions in one unit. There are ways to help the operator and cut the measuring time by using dedicated software for signal identification and interpolation of data. This article gave an overview of the results of research work carried out in the field of radiomonitoring. 17 refs.

**Reception Quality** See Also RADIO RECEIVERS—Performance; TELECOMMUNICATION LINKS, RADIO—Digital Devices.

**087890 DOUBLE-SIDEBAND SHORTWAVE-BROADCAST SIGNAL-QUALITY ESTIMATION ALGORITHM.** A method and related algorithm for assessing the quality of a full-carrier, double-sideband signal are presented that were developed through statistical processing of empirical measurements of parameters of the received signal before and after detection. Preliminary results are presented showing the comparison of the objective automated measurement ratings against subjective human listener ratings of overall quality on a five-level scale. The algorithm has been developed to gauge the perceived quality and, inferentially, the intelligibility of a broadcast composed of speech, given that the ultimate goal of a broadcaster is to have the message received and understood by the largest audience possible. The algorithmic measures apply to all broadcast program material; music, as well as speech. 33 refs.

## RADIO ALTIMETERS

**087891 RESPONSE CHARACTERISTICS OF A SHORT-RANGE, HIGH-RESOLUTION DIGITAL SONAR ALTIMETER.** The Datasonics Model ASA-920 digital sonar altimeter (DSA) is a compact, high-frequency (1 MHz), short-range (0.5-5 m) underwater sonar device originally designed as an altimeter for submarines. The DSA has previously been successfully used on a bottom-mounted tripod to measure changes in relative bed elevation at a point on the seafloor prior to and during a storm. Fixed to a rigid mounting on the seabed, the DSA produces a digital output that is proportional to the transducer elevation above the bed. The purpose of this report is to describe the response characteristics of the DSA. Tests using a flat steel plate and a flat sand bed as targets showed that the DSA is capable of resolving differences in elevation of at least 0.5 cm. A laboratory calibration demonstrated that the instrument response is linear. In general, the altimeter does not 'see' into the troughs of ripples when its height above the bed is more than eight times the ripple wavelength. In the field, the acoustic pulse is susceptible to interference by suspended particulate matter and bubbles. (Edited author abstract). 7 Refs.

**087892 ANALYSIS OF THE POSSIBILITIES FOR STUDYING THE MOON AND THE PLANETS WITH THE HELP OF COSMIC SOURCES OF RADIO WAVES.** The possibilities of sounding the moon and the planets with the help of a cosmic source of radio waves are examined. It is shown that it is now possible to carry out experiments on radio sounding of the soil and plasma-spheres of the planets with the help of the earth's kilometer emission in the 100-500 kHz band. It is proposed that the reflected radiation be received on an artificial satellite orbiting the planet. (Author abstract) 13 refs.

**087893 THEORY OF RADIO EMISSION FROM PULSARS (REVIEW).** We discuss in detail the properties of the plasma in a pulsar magnetosphere. We also present a brief review of the current state of the theory of the radio emission. A theory is used to determine the dielectric permittivity tensor for a relativistic plasma moving along the field lines of a curvilinear magnetic field enabling us to find the normal modes of oscillation in such a plasma. It is shown that when the plasma density is high enough, a hydrodynamic instability is excited, leading to the rapid growth of two of the normal modes of electromagnetic oscillations we called 'bending plasma modes.' We consider the specific conditions in pulsar magnetosphere show that the rapid build-up of the bending plasma modes of oscillation occurs in the close-range region of the magnetosphere. At distances of (30-300) R from the neutron star, these oscillations are transformed into the usual radio emission, directed along the magnetic field lines. The basic properties of this emission (the range of frequencies, the directional diagram, the intensity, and the polarization) are in overall agreement with the observational data. 63 refs.

## Australia

**087894 FROM WARTIME RADAR TO POSTWAR RADIO ASTRONOMY IN AUSTRALIA.** The special circumstances which led to Australia playing a leading part in the development of the new science of radio

astronomy are here described. Observational and instrumental breakthroughs were made in the late 1940's and in the 1950's, after which there was a transition to the "Big Science" era of radio astronomy. The Parkes Radiotelescope has played a notable part in that era. (Author abstract). 20 refs.

Bowen, E.G. (CSIRO, Aust.). *J Electr Electron Eng Aust* v 8 n 1 Mar 1988 p 1-11.

**087895 AUSTRALIAN CONTRIBUTION TO THE SCIENCE OF RADIOASTRONOMY.** Australia has made numerous major contributions to the science of radioastronomy and played a leading role in its early development. The history of the Australian effort is reviewed, from this early seminal work until the present day when contributions continue at an important level. Topics include: sea, two antenna, and grating array interferometers; solar spectroscopy; and radio observatories. (Edited author abstract). 55 refs.

#### Equipment See Also RADIATION DETECTORS.

**087896 AN EXPERIMENTAL SUBMILLIMETRE HETERODYNE ARRAY RECEIVER.** An experimental array receiver is described which is intended for radioastronomical observations of the J=3-2 line of carbon monoxide. It consists of six medium antimonide mixers cooled to  $\approx 2\text{K}$  in a pumped helium cryostat, with rectangular feed horns arranged on a  $3 \times 2$  grid at the f/9 focus of the UK Infrared Telescope (UKIRT). Each detector is mounted in a length of fundamental mode waveguide and has an independently tunable backshort. Local oscillator power is provided by a frequency tripler pumped by a klystron, and is coupled to the array via a 'lossless' quasi-optical coupler which is described in detail. (Edited author abstract). 16 Refs.

#### Measurements

**087898 PHASE RETRIEVAL RADIO HOLOGRAPHY IN THE FRESNEL REGION: TESTS ON THE 30 m TELESCOPE AT 86 GHz.** The application of phase retrieval radio holography in the Fresnel region has been studied using an 86 GHz transmitter as signal source. Maps of the aperture-plane field distribution were made with a surface resolution of about 100 independent pixels across the telescope diameter. Over the 2.7 km propagation path used (0.005 of the far-field distance), the measurement accuracy was found to be determined by atmospheric scintillation. The root mean square measurement errors in the derived aperture-plane phase distribution were about 65 microns when expressed as axially resolved surface errors. The snr and dynamic range requirements are easy to fulfill in the Fresnel zone, while the necessary near field corrections can be applied with high accuracy. There are thus definite advantages to phase retrieval radio holography in this near field zone. (Author abstract) 7 refs.

#### Microwaves

**087899 MICROWAVES: THE NEW HORIZONS OF RADIO ASTRONOMY.** Exciting discoveries were made in radio astronomy in previous years. The picture of the 'invisible' universe at radio wavelengths has emerged. Radio astronomy could give detailed information about numerous phenomena. The process of star formation is being studied in spectral lines - especially in the new millimetre/submillimetre frequency ranges. The death of a star - a supernova - can be studied in radio continuum. The energy balance thus observed gives us an understanding of basic physical processes in the nuclear reactions in the universe. The observation of pulsars, as a result of a supernova explosion, allows us to study condensed neutral matter. Observations of radio polarisation gave us new information about magnetic fields in galaxies. Beyond the Milky Way and other nearby galaxies great energy emissions are seen at radio wavelengths. Jet phenomena in the universe have been made visible by aperture synthesis radio telescopes. Radio telescopes probe the most distant fringes of the universe - using new microwave devices. (Author abstract)

Wielebinski, Richard (Max Planck Inst fuer Radioastronomie, Bonn, West Ger). *Alta Freq* v 56 n 10 Dec 1987, 17th Eur Microwave Conf and Workshop, Sep 7-11 1987 p 377-379.

**087900 PRINCIPLES OF MODULATION AND CHANNEL CODING FOR DIGITAL BROADCASTING FOR MOBILE RECEIVERS.** This article explains the benefits of using a system called Orthogonal Frequency Division Multiplexing to overcome the adverse effects of severe multipath propagation such as occurs in mobile reception. The signal is demodulated with the aid of a fast Fourier transform technique. Consideration is given to the digital coding arrangement. It is concluded that a concatenation of a convolutional code and a Reed-Solomon code gives excellent results. The feasibility of implementing such a system for the domestic market is discussed. (Edited author abstract) 26 refs.

Alard, Michel (CCETT, Fr); Lassalle, Roselyne. *EBU Rev Tech* n 224 Aug 1987 p 168-190.

#### Automation

**087901 VOA NETWORK CONTROL AND AUTOMATION.** The Voice of America's (VOA's) effort to design, develop, and implement a broadcast network control and automation system as part of a multiyear modernization program is described. A brief background discussion of the VOA network control system NCS, a description of the design, a description of a pilot system being built, and the current status of the effort are included.

Putkovich, Kenneth (Voice of America, USA). *IEEE Trans Broadcast* v 34 n 2 Jun 1988 p 301-305.

#### Computer Aided Analysis

**087902 METHODOLOGY AND COMPUTER TOOLS TO SEMI-AUTOMATE ASSESSMENTS OF SHORTWAVE BROADCAST COVERAGE RESULTING FROM MULTIPLE TRANSMISSIONS.** A computer-assisted methodology, developed for using a point-to-point ionospheric propagation and communications system performance model to assess shortwave broadcast coverage, is presented. The listening area is approximated by a set of geographic coordinates (test points), and the required power gain (RPRG) for the link from each transmitter site to each test point is computed using the IONCAP ionospheric communications analysis and prediction program. The broadcasts may originate simultaneously from a single site or from multiple-transmitter sites (i.e., multicast). Figures of merit are assigned

in terms of the RPG values, and area coverage statistics are computed for the simulated broadcasts. Three interactive computer programs were developed to permit a semi-automated multicast broadcast coverage analysis using IONCAP and a computerized equipment database. They are: propagation parameter set-up program; transmission plan set-up program; and, multicast analysis program. 27 refs.

Hagn, George H. (SRI Int, Arlington, VA, USA); Lee, Mary; Worthington, David R.L.; Harnish, Lawrence O. *IEEE Trans Broadcast* v 34 n 2 Jun 1988 p 283-291.

#### Computer Interfaces

**087903 WERTACHTAL SHORTWAVE BROADCASTING STATION.** A description of the Wertachtal, West Germany shortwave broadcasting station is presented, along with modifications to satisfy Voice of America (VOA) requirements. A brief description of proposed high-efficiency transmitters, and new computers and supervisory equipment is included. 3 refs.

Strohmayr, Johann (Wertachtal Shortwave Broadcasting Station, Ettlingen, West Ger). *IEEE Trans Broadcast* v 34 n 2 Jun 1988 p 306-308.

#### Control Systems

**087904 KONZEPT EINER DIGITALEN SENDEBEREICHE.** [Digital Programming Control Centre]. The article outlines a method of gradual digitization of the broadcasting centre. A parallel configuration of analogue and digital equipment can, without impacting on operating procedures, be used to set up a continuous transmission chain extending from the digital sound source, such as a compact disc reader or video recorder, to the listener's satellite receiver. (Author abstract). In German.

**Federal Republic of Germany** See RADIO SYSTEMS—Stations.

#### France

**087905 BROADCASTING NETWORKING via SINGLE PSTN 'B' CHANNELS.** At five sites worldwide, broadcasting stations now receive network programs from a Paris programming center, sent at 64 kbps, on a single bearer (B) channel of the French digital public switched telephone network (PSTN). Within the provisions of CCITT Recommendation G.722, these programs offer 'commentary-quality' sound, which am and fm radio listeners find fully satisfying for speech and all music programs except high fidelity. The end-to-end digital circuits that distribute programs originating in Europe to local broadcasting stations via the PSTN and the TELECOM 1 domestic satellite are presented. An application is outlined which transports three programs intercontinentally (1,2,3) and one (L) for broadcast in Paris. Program 2 originates in the Paris studio; the others start at remote locations. The conventional method of broadcast-grade audio transport requires the PSTN equivalent of three telephone channels per program, whether the PSTN is analog or digital.

## Mathematical Models

**087907 MODELLHAFT BESCHREIBUNG DER QUANTITATIVEN UEBERTRAGUNGSKAPAZITAET ZUR BEURTEILUNG DER PLURALITAET BEI UKW-SENDERNETZEN.** [Mathematical Description of Quantitative Broadcast Capacity for Evaluation of the Plurality of VHF/FM Transmitter Networks]. The article describes a model serving for the quantitative evaluation of the broadcast capacity of terrestrial transmitters by means of a numerical terrain model and other spatial data. An analysis of the plurality is done through a logical configuration of the broadcast capacity of the various transmitters, i.e. the number of receivable programmes is determined as a function of the receiving site. (Author abstract) 6 refs. In German.

Seiler, Von Werner; Stoecker, Friedrich. *Rundfunktech Mitt* v 31 n 5 Sep-Oct 1987 p 209-220.

**087908 FITTING GRAPHS AND NUMERICAL TABLES FOR A SINGLE PARAMETER REPRESENTATION OF THE SHAPE OF PROGRAMME SOUND SIGNAL DISTRIBUTIONS.** In order to represent the statistical character of a sound signal simply and with a single parameter, numerical tables and graphs of theoretical distributions for the estimation of a parameter called the shape parameter of the distribution are presented. The theoretical distributions are based on a statistical model of broadcast signals which was derived from the analysis of variations in measured distribution. The statistical functions dealt with are pdfs (probability density functions) and cdfs (cumulative distribution functions) for instantaneous amplitude and power, for rms-valued intensity fluctuations, and for one-minute mean powers and peak powers. A list of the values of the shape parameter estimated for CCIR data is given, from which almost all the CCIR data can be reproduced by using the theoretical distribution curves and the numerical tables presented. 7 refs.

Ehara, Shiro (NHK, Tokyo, Jpn). *IEEE Trans Broadcast* v 34 n 1 Mar 1988 p 9-17.

Performance See ANTENNAS—Radiation.

## Planning

**087909 PLANNING FOR RADIO BROADCAST SERVICES.** Differing political requirements for radio broadcasting services have led to different planning solutions. In turn, this has led to various frequency planning techniques being applied in different countries. Because radio-wave propagation does not respect national boundaries, a degree of re-arrangement of idealized plans is inevitably needed to ensure that multiple sets of national broadcasting requirements can co-existence without excessive cross-border interference. One result is that a final agreed plan contains elements of different philosophies, together with modifications to enable co-existence, and no clear picture may emerge of any underlying coherent strategy. The latter may usually be found by examination of the detail for geographically distinct sub-regions, when it can be seen that the frequency planning techniques employed have much in common with those in use by some other services. 13 Refs.

Hunt, K.J. (European Broadcasting Union, Brussels, Belg). *J Inst Electron Radio Eng* v 58 n 4 Jun 1988 p S55-S64.

**087910 FUTURE OF HIGH FREQUENCY BROADCASTING.** Since the end of World War II the number of daily frequency hours used by high-frequency (HF) broadcasting (also known as shortwave and band 7,

3-30 MHz) has tripled. At present, approximately 35,000 daily frequency hours are carried in an HF spectrum that can barely accommodate half that amount. As a consequence, congestion is severe, and interference levels intolerably high. Attempts to remedy this situation by planning the high-frequency bands date back to 1947, but, thus far, they have not been successful. International planning conferences in 1984 and 1987 have shown a possibility for agreement; another conference is tentatively scheduled for 1992. Some broadcasters have attempted to solve their congestion problems by moving out-of-band, sometimes expanding their services into bands allocated to other services, such as amateur radio, fixed, aeronautical, and mobile. It is feared this trend will continue. The attempts that have been made to plan the HF bands in an effort to alleviate congestion are described and the outlook for the remainder of this century is discussed. 8 refs.

Leinwoll, Stanley (Radio Free Europe/Radio Liberty Inc, New York, NY, USA). *IEEE Trans Broadcast* v 34 n 2 Jun 1988 p 94-101.

**087911 RESULTS OF WARC-HFBC(87): TECHNICAL IMPLICATIONS.** The planning principles and technical parameters that were decided at the 1987 second session of the World Administrative Radio Conference (WARC) for the planning of the HF bands allocated to the broadcasting service (HFBC) are described. These planning principles and parameters are intended for use in developing test plans to satisfy the world's high-frequency broadcast requirements. Those parameters that were modified at the second session of the conference are discussed toward obtaining a workable and universally acceptable planning system for shortwave broadcasting. With reference to the results of the planning exercises that were used as the basis of decisions at the second session, the likely impact of these decisions on the HF broadcast planning process is described. Some issues that are likely to concern the US broadcasters in preparation for the third session of WARC are summarized in conclusion. 10 refs.

Rush, Charles (Nat'l Telecommunications & Information Administration, Boulder, CO, US); Jacobs, George; Richards, Warren. *IEEE Trans Broadcast* v 34 n 2 Jun 1988 p 102-108.

## Reliability

**087912 METHODOLOGY FOR MODELING THE RELIABILITY, AVAILABILITY AND MAINTAINABILITY (RAM) OF A GENERIC SHORTWAVE BROADCAST RELAY STATION.** A methodology for developing a reliability, availability and maintainability (RAM) model that is applicable to evaluating conceptual designs for shortwave broadcast relay stations is described. A generic relay station (GRS) that has nine major subsystems exclusive of the ionospheric propagation path is proposed. The reliability of the propagation path to the listeners is not addressed. An example of the use of the methodology is presented for the GRS and the sensitivity of the model results is studied for the most significant subsystems from a RAM standpoint: the satellite earth station that delivers the program feeds and the high-powered transmitters. 4 refs.

Willet, Jack H. (SRI Int, Menlo Park, CA, USA); Harvey, David L.; Hagn, George H. *IEEE Trans Broadcast* v 34 n 2 Jun 1988 p 242-262.

## Space Applications

**087913 TOWN CRIER TO WORLD SEER: A BROADCAST ODYSSEY.** A review of the development of broadcasting is given and thoughts are presented for its evolution into the 21st century. Although the terrestrial radio and television networks are unlikely to expand greatly in future, their usage may change, particularly to satisfy new interests in the broadcasting of data or information. Emphasis is placed on the importance of satellites in the next decade, for international programme supply, for delivery of radio and television to the home, and for satellite news gathering. The direct broadcasting of television by satellite to the home, starting in 1989 in

the UK, also offers exciting new opportunities for carrying higher-definition, widescreen pictures. It is suggested that in the next couple of decades a slowly changing balance between terrestrial, satellite and cable networks will be seen, with fibre optic connections to the home only starting to make an impact with new services in the next century. Most significant in the near future will be the way in which new delivery technology and new receiver developments will increase the choice of programmes and broadcast information services to the user. (Author abstract)

## Switzerland

**087914 RECEPTION OF RADIO AND TELEVISION PROGRAMMES IN SWITZERLAND.** The author evaluates the number of households that can receive radio and television programs if they own the necessary installations, starting with the coverage area of terrestrial transmitters, receiving antennas for satellite signals and the number of connections to the cable distribution networks. The PTT's responsibility is not limited to the transmission of signals. It also has to ensure use of the receiving installations at the best possible conditions. Therefore, it regulates the use of the radio frequency spectrum to assure efficient utilization. In English and French.

## United States

**087915 EARLY HISTORY OF U.S. INTERNATIONAL BROADCASTING FROM THE START OF WORLD WAR II.** At the time the US entered into World War II in 1941, there were eleven shortwave international broadcasting stations in the US, all privately owned by companies or foundations. Recognizing the psychological warfare potential of these facilities, the US Office of War Information (OWI), an agency under the Executive Office of the President, negotiated operating contracts with the owners and established studios in New York and San Francisco to provide government programming. This was the origin of the Voice of America. At the same time, budget requests were made to the US Congress and funds appropriated for shortwave facilities expansion and for certain overseas stations operated by the overseas branch of the OWI. The operational and expansion programs which increased the number of shortwave transmitters to 36 in eight station sites by the end of World War II are reviewed. At the end of the war, the OWI was replaced by the US Information Agency (USIA) with its international broadcast service operating the Voice of America. The further expansion of shortwave broadcasting under USIA is outlined. 4 refs.

**087916 RADIO COMMUNICATION THROUGH ROCK.** Electromagnetic waves do propagate through rock. Their ability to do so is a complex function of frequency, geological criteria (both electrical and physical) and antenna characteristics. This article reviews the work done over many years to solve the problems of transmission without having to rely on wave-guiding devices such as leaky feeders. 11 refs.

Austin, B.A. *Electron Wireless World* v 93 n 1619 Sep 1987 p 943-946.

**087917 TRACK TO TRAIN RADIO COMMUNICATION SYSTEM OF SWISS FEDERAL RAILWAYS.** Mobile radio communication systems are an important instrument of railway operations control. They must, however, take account of the user's requirements and of his infrastructure if genuine benefit and rationalization are to be achieved. Realizing the advantages of combining control and communications technology, Brown Boveri Radiocom developed the RANCOS family of radio network control systems. With it, a track to train radio communication system for railways has been built whose structure and user-friendliness will be the standard in the future. Brown Boveri, as general contractor, is fully responsible for the construction of Swiss Federal Railway's country-wide track to train communication system. The authors consider the objectives, the system configuration and its main features and benefits. The radio communication system will be tested on a specially equipped line in the spring of 1988. (Author abstract) 5 refs.

**087918 MULTI-STATION PACKET-RADIO NETWORK.** A new structure for packet-radio networks, called the multi-station network, is suggested and analyzed. We describe the salient features of this structure that consists of a large number of nodes and several stations. We then focus on one of the main problems within the suggested structure, the problem of forwarding packets from the nodes to the stations through a shared radio channel. Two basic forwarding schemes are investigated and compared. The classical slotted ALOHA is considered as an access scheme to the shared channel. (Author abstract) 15 refs.

Sidi, Moshe (IBM, Yorktown Heights, NY, USA); Cidon, Israel. *Perform Eval* v 8 n 1 Feb 1988 p 65-72.

**087919 PROTECTION OF A NARROW-BAND BPSK COMMUNICATION SYSTEM WITH AN ADAPTIVE ARRAY.** The performance of an adaptive array when used with narrowband BPSK (binary phase-shift-keyed) communication signals is described. Earlier results for the performance of an adaptive array used with a standard BPSK signal when the array bandwidth is several times the signal bandwidth are extended to the case in which the array bandwidth is as small as possible, equal to the desired signal symbol rate. To realize such a bandwidth reduction, the BPSK signaling waveform is reshaped before transmission to prevent intersymbol interference. The performance of the optimal detector for the narrowband BPSK signal is determined when this detector operates behind an adaptive array that is subjected to CW interference. The bit error probability is obtained as a function of the desired signal and interference powers and arrival angles as well as the array bandwidth. 18 refs.

**087920 CHARACTERIZING THE MULTIPATH AND DOPPLER SPREADS OF THE HIGH-LATITUDE METEOR BURST COMMUNICATION CHANNEL.** High-latitude propagation phenomena, such as scatter from the aurora and sporadic-E propagation, can alter the communication characteristics of the meteor communication channel. An experiment is described in which the fading and multipath profiles of the high-latitude meteor communication channel are characterized. The effects of high-latitude propagation phenomena on the capacity and reliability of meteor burst communication are discussed. 9 refs.

**087921 OPTIMUM COMBINING FOR INDOOR RADIO SYSTEMS WITH MULTIPLE USERS.** The

author studies the use of optimum combining to increase the capacity of narrowband in-building radio communication systems with multiple users. He considers systems consisting of a base station with numerous remotes in a Rayleigh fading environment and studies the problem of more users requiring channels than the number of channels available. A system is described that, with multiple antennas at the base station but only one antenna at each remote, uses optimum combining to suppress interfering signals. It is shown that this system, with M antennas at the base station, can achieve an M-fold increase in the number of users or tolerate M-1 interferers from other systems. Thus, with optimum combining, radio communications can be used in high-density, multiple-user environments, such as within buildings, even when only limited bandwidth is available. 20 refs.

**087922 DISTRIBUTED ANTENNAS FOR INDOOR RADIO COMMUNICATIONS.** The implementation of an indoor radio communications system serving an entire building from a single central antenna has been limited to small buildings and narrowband frequency-division multiple-access (FDMA)-type systems with limited reliability and flexibility, because of signal attenuation and multipath delay spread. The results of indoor radio propagation measurements of two signal distribution approaches that overcome these problems are presented. In the first, the building is divided into many small cells, each served from an antenna located in its own center, with adjacent cells operating in different frequency bands. In the second approach, the building is divided into one or more large cells, each served from a distributed antenna system or a leaky feeder that winds its way through the hallways. This approach eliminates the frequency-cell handoff problem of the first approach, while still greatly reducing multipath delay spread and signal attenuation compared to a centralized system. Sophisticated broadband TDMA-type systems that are flexible, robust, and virtually building-independent are thus possible. 13 refs.

**087923 MICROWAVE PERFORMANCE MONITOR APPLICATION AT THE BONNEVILLE POWER ADMINISTRATION.** Experience is reported with an automatic performance monitoring system which monitors pertinent operational parameters of seven major microwave systems. The microwave monitor (MWM) system provides operations and maintenance personnel with continuous measurement of each system's performance. The MWM detects gradual MW system degradation and impending failures before an outage occurs. This allows maintenance visits to be scheduled in advance. In addition, the MWM isolates problems to specific sections of each microwave system allowing rapid location and repair. The MWM also performs automatic diagnosis, and only requires remote terminals at the ends of each microwave system. It is suggested that the MW monitor can be used to evaluate the maintenance approach and procedures in use. 3 refs.

**Performance**

**087925 RADIO COMMUNICATION TRENDS.** This paper describes a number of radio transmission systems presently in use in NTT, and reviews the current developmental trends in radio communications technologies and services. Microwave digital radio-relay systems have been used for various links in NTT. A new high capacity microwave digital system, which is now under development, is a novel long-haul digital radio system for ISDN trunk transmission links. Subscriber radio systems represent a new terrestrial radio application, used principally for high-speed or broadband subscriber loops. Satellite communications are employed for many purposes, such as for emergency security measures for inter- and intra-city transmission links, for communication with remote island locations, and for leased circuits. New satellite applications to integrated transit circuit systems for public networks and TV signal transmission systems are now being considered. (Edited author abstract) 14 refs.

**Planning**

**087927 NEW DEFINITION OF THE RADIO COVERAGE AREA.** Coverage area is defined as a statistical concept offering to planners and users of radio services more relevant data than different definitions currently used. Based on an appropriate field strength determination method which takes into account the local terrain irregularities, this definition yields a realistic picture of the efficiency of a transmitter in covering relevant areas. A computer program package enabling an easy and rapid determination of the coverage area, thus defined, is developed. For the prediction of the field strength, the 'clearance angle' method has been used. Several examples have been elaborated, the results of which justify the use of the definition proposed. (Author abstract) 13 refs.

## Analysis

**087931 INFLUENCE OF INTERCHANNEL CONNECTIONS IN A RECEIVER AMPLIFIER CIRCUIT ON THE ACCURACY OF A MONOPULSE RADIO DIRECTION FINDER.** The hardware error of a monopulse radio direction finder results from the fact that the gain-phase characteristics of the channels in its receiver-amplifier circuit are not identical. We report results of an investigation into the influence of interchannel coupling on the accuracy of direction finding in an application to a situation important in practice, in which coupling takes place at the inputs of all intermediate frequencies simultaneously. To make the analysis specific we have selected as its object an amplitude sum-and-difference radio direction finder. 4 refs.

## Testing

**087934 KNOWLEDGE-BASED TECHNIQUES FOR FAULT DETECTION IN DIGITAL MICROWAVE RADIO COMMUNICATION EQUIPMENT.** The application of two distinct approaches to the diagnosis of faults in digital communication equipment is examined. The selected artificial-intelligence approaches use either rule-based or machine-learning techniques. Faults up to 8-dB TWT (traveling-wave tube) overdrive, 10% spacing error in the signal constellation, and 5° nonorthogonality in the modulating carriers are introduced on an 11-GHz radio. Each approach shown is capable of diagnosing both the type and magnitude of the introduced faults, subject to certain constraints for each system. Results indicate that the machine learning system is more appropriate than the rule-based system for providing optimal adjustment of the radio, where the underlying mechanisms are too complex to allow simple rules of thumb to be applied. However, the rule-based technique has been shown to be suitable for areas with large nonlinearities. A combination of the two techniques would solve some of the problems caused by the suitability of each method to a specific problem type, the rule-based approach covering the areas with large nonlinearities and the machine learning system the more linear regions. This would help in simplifying the implementation as it would minimize the number of rules required for each different radio type. 11 refs.

**087937 POLAR OCCURRENCE MAP OF BROAD-BAND AURORAL HISS OBSERVED BY ISIS SATELLITES.** A polar map of the occurrence rate of broad-band VLF hiss was made from narrow-band VLF intensity data of 6 frequencies processed from ISIS electric field (50 Hz — 30 kHz) tapes of 347 ISIS-VLF passes received at Syowa station, Antarctica between June 1976 and January 1983. The high-latitude contour of occurrence rate of 0.3 lies at invariant latitude of about 82° for all local times. The low-latitude contour of 0.3 lies at 74° around 10 MLT (geomagnetic local time) and it extends down to 67° around 22 MLT. The low-latitude contour of 0.3 is approximately symmetric with respect to the 10-22 MLT meridian. Two regions of high occurrence rate above 0.5 lie between 76° and 78° in the afternoon sector and also between 78° and 81° in the late night-early morning sector. (Edited author abstract) 20 refs.

Ondoh, Tadanori. *J Radio Res Lab (Jpn)* v 35 n 144 Mar 1988 p 1-14.

**087938 VLF NOISES TRIGGERED BY WHISTLERS AS OBSERVED IN THE TOPSIDE IONOSPHERE.** Characteristics of whistler triggered emissions observed in the topside ionosphere are examined using ISIS-, -2 and DE-1 VLF electric field data (50 Hz — 30 kHz) received at Kashima station, RRL, Japan. Most of these emissions are LHR emissions which occur for a few seconds after whistlers near the lower hybrid resonance frequency at mid- and high-latitudes. Whistler triggered emissions are classified according to the type of whistler, i.e. ducted whistlers with a continuous trace over the full frequency range of the spectrum and non-ducted whistlers without a complete trace below  $f_{LHR}$ . (Edited author abstract) 10 refs.

**087939 COMPARATIVE STUDY OF VLF RADIO WAVE PHENOMENA FROM DE-1 AND ISIS SATELLITES RECEIVED AT KASHIMA, JAPAN.** Magnetospheric VLF radio wave phenomena have been interpreted using spectral analysis of plasma-wave electric field (650 Hz — 10 kHz) data from the DE-1 satellite received at Kashima, Japan. Chorus, narrow-band hiss, ELF hiss and whistler characteristics observed in the plasmasphere ( $L \leq 4$ ) by the DE-1 are similar to those of the corresponding VLF emissions observed by the low-altitude polar orbiting satellites, ISIS-1 and ISIS-2. In low-density ( $f_H > f_{UH}$ ) plasma of the high latitude magnetosphere, the electron plasma frequency is the upper limit frequency of the whistler-mode waves. (Edited author abstract) 15 refs.

## Analysis

**087940 NONCOHERENT DELAY-LOCK PN TRACKING LOOP: IMPACT OF RFI AND NONIDEAL ARM-FILTER CHARACTERISTICS.** A noncoherent delay-lock PN tracking loop is investigated. The

approach used is one in which simulation and analysis are combined to generate tracking performance. Performance data are presented for pseudonoise (PN) phase jitter standard deviation and compared to theoretical results. The impact of radio frequency interference and gain/phase imbalances on PN tracking performance is determined, and performance data are given. It is suggested that self-noise terms and nonideal arm-filter characteristics may be significant factors in the investigation of PN tracking performance for those cases in which PN code timing synchronization is a major concern.

**087942 ERROR PROBABILITIES FOR DS SPREAD-SPECTRUM SYSTEMS USING AN ALE FOR NARROW-BAND INTERFERENCE REJECTION.** The effects of the least-mean-squares adaptive line enhancer (ALE) weight misadjustment errors on the bit error rate are investigated for a direct-sequence spread-spectrum binary communication system in the presence of strong narrowband interference. The converged ALE weights are modeled as the parallel connection of a deterministic FIR (finite-impulse response) filter and a random FIR filter. The statistics of the random filter are derived, assuming the output of the random filter to be primarily due to the jammer convolved with the random filter weights. This output is shown to be non-Gaussian and to cause significant error rate degradation in comparison to a Gaussian model. Error probability expressions are derived for the bit error rate, evaluated numerically, and compared to the corresponding error probabilities for a Gaussian model for the random filter output. For some typical system parameter values and error probabilities, it is shown that the Gaussian model yields performance results that are too optimistic by several decibels. 17 refs.

**087943 JAMMING TO THE HF BROADCASTING SERVICE.** The Institute for Telecommunication Sciences has been actively involved in an internationally coordinated monitoring program to determine the location of emitters of harmful interference (jamming) to the high-frequency (HF) broadcast service. Four monitoring programs were undertaken between October 1984 and June 1986. The procedures that have been used and the results that have been obtained are summarized. The locations of the emitters that cause jamming to the HF broadcast service are shown and selected characteristics of the jamming environment are described. The degree to which jamming that is directed to certain broadcasters adversely impacts the performance of other broadcast services that operate on the same or adjacent channels as the targeted broadcaster is examined. 7 refs.

## Legislation

**087944 ITU PROTECTION AGAINST HARMFUL INTERFERENCE.** Harmful interference, which can make radio communication difficult, sometimes even impossible, has been abhorred by the ITU. Its presence infringes a country's right to communicate through radio waves; hence the presence of harmful interference amounts to violation of international law. The ITU, through the law laid down in the Radio Regulations, Edition of 1982, has protected law abiding countries against harmful interference. This paper makes a techno-legal study of the protection granted to law abiding countries against harmful interference under the law. (Author abstract) 10 refs.

Sharma, G.N. (Space Applications Cent, Ahmedabad, India). *Space Commun Broadcast* v 5 n 5 Nov 1987 p 365-370.

**087945 NEW RFI LEGISLATION AFFECTS THE UK MANUFACTURER.** The draft EEC directive on electromagnetic compatibility (EMC) Document 59/87/EN has now been submitted to the European Council of Ministers. The directive seeks to standardize EMC legislation throughout the EEC. It will, for the first time, regulate all electric and electronic appliances, equipment and installations (except motor vehicles and tractors) through the whole of the electromagnetic spectrum. A summary of the implications of the new draft EEC directive on electromagnetic compatibility is presented.

**Suppression** See Also RADIO TRANSMISSION—Spread Spectrum; TELECOMMUNICATION LINKS, SATELLITE.

**087948 COCHANNEL OPERATION EVEN UNDER SEVERE CROSS-POLARIZATION INTERFERENCE.** Due to their greater vulnerability to cross-polarization interference, 64-QAM systems will require a cross-polarization interference canceller (XPIC) for virtually all links. Cancellers of this kind are paving the way to bandwidth efficiencies of up to 10 bit/s/Hz, without requiring 4096 modulation levels. This makes cochannel operation a highly attractive means of achieving

maximum bandwidth utilization for digital radio transmission. (Author abstract) 9 refs.

**087951 EVALUATION METHOD OF POLYNOMIAL MODELS' PREDICTION PERFORMANCE FOR RANDOM CLOCK ERROR.** In satellite navigation systems such as the Global Positioning System, clock error is one of the major sources of error in precise pointing. In order to remove clock error, it is modeled as a second-order polynomial and the clock-error correction parameters are sent to users. However, a random clock error cannot be modeled as a second-order polynomial. Therefore, the time discrepancies due to random clock error must be taken into consideration for precise pointing. This paper proposes an analytical computation method for estimating the random clock error in the current system which makes use of the Allan variance characteristics of random clock error without random clock realization and a lot of simulation studies. Moreover, a numerical example based on the proposed method shows that the first-order polynomial model is better for predicting a random clock error than the second-order polynomial. (Author abstract) 5 refs.

**087952 INTERNATIONAL FUTURE NAVIGATION NEEDS: OPTIONS AND CONCERNS.** The paper examines likely needs which can be foreseen from civil users of navigation systems, be they aviation, marine, or land. Differences between users in the USA and in Europe are considered. The need for full international discussion is stressed as a prerequisite for trust in the system. It is also argued that the USA has as much to gain from such discussion as has the rest of the world. The paper concentrates on the Navstar Global Positioning System (GPS), which is seen as a considerable advance on earlier navigation systems. Nevertheless, the international community has several anxieties. Selective availability is likely to hurt US users as much as those in Europe and the integrity issue is an area where international discussion and cooperation is considered to be particularly valuable. (Author abstract) 8 refs.

**087953 COVERAGE OF A RADIO BEACON-BASED DIFFERENTIAL GPS NETWORK.** A radio beacon-based system is being investigated by the U.S. Coast Guard for the communication of differential GPS (DGPS) messages. This system would add a digitally modulated subcarrier to transmissions from existing marine radio beacons, which operate in the 285 kHz to 325 kHz band. This paper discusses the prediction of DGPS/radio beacon signal coverage. Several coverage charts are presented as examples. The paper also lists which major U.S. harbors (8 million tons of cargo per year or more) can and cannot be covered if the DGPS subcarrier is installed on existing, continuous-broadcast radio beacons. The achievable signal coverage depends on which error correcting code is used, and the paper analyzes coverage for a 'rate 1/2' code and 'rate 1/8' code. (Edited author abstract) 13 refs.

**087955 RADIO VEHICLE POSITION REPORTING TECHNIQUE THAT IS PROTECTED FROM INTERCEPTION AND DIRECTIONAL FIXES.** Vehicles used to transport nuclear materials can determine their position with respect to an established grid by electronic means such as geosynchronous navigation satellite (GPS) or hyperbolic radio. It is frequently necessary to relay this position information via a radio link to a command center. If a modern data encryption technique is used, the usefulness of interception almost disappears. A hypothetical system is presented that is called burst mode frequency hopping (BMFH). The mobile transmitter sends very short modulated bursts that are hopped through a pseudo-random frequency map. Actual data are encrypted and then embedded in an interleaved error correcting code. (Edited author abstract) 18 refs.

## Analysis

**087956 EXPERIMENTAL MEASUREMENT AND CHARACTERIZATION OF IONOSPHERIC AND MULTIPATH ERRORS IN DIFFERENTIAL GPS.** Real-time differential GPS is fundamentally limited by a) signal estimation errors, b) satellite ephemeris errors, c) propagation decorrelation errors, and d) local multipath errors. In this paper we address the latter two error sources. An understanding of these is needed to establish an error budget for any monitor station network that the U.S. Coast Guard would consider for a nationwide system. 4 refs.

**Applications See SATELLITES—Navigation Aids Application; VEHICLES—Navigation Systems.**

## Computer Applications

**087957 AUTONOMOUS NAVIGATION - WHEN WILL WE HAVE IT?** The utility of autonomous navigation for spacecraft operations is examined to define the related critical issues facing a spacecraft designer. From the various means available, relative navigation to other spacecraft, especially to GPS, is shown as the most cost-effective near-term means of approaching the goals of

autonomous navigation, without necessarily achieving real autonomy. The latter will evolve with our confidence in artificial intelligence technology as an essential prerequisite to truly autonomous spacecraft operating, including the navigation task. (Author abstract) 21 refs.

Treder, Alfred J. (Boeing Aerospace Co, Seattle, WA, USA). *Navigation* v 34 n 2 Summer 1987 p 93-114.

## Equipment

**087958 WHERE IN THE WORLD ARE WE?** The coordinate converter-equipped radionavigation receiver is now commonplace. Most U.S. civil charts are printed using North American Datum-1927, while coordinate converters are based on World Geodetic System-1972. The variations between these two common descriptions of the shape of the Earth range from zero to nearly 200 meters in U.S. waters. It is fortunate that the majority of precise navigation in the U.S. is performed utilizing systems (usually Loran-C) in their repeatable mode. Those systems employed in an 'absolute' accuracy sense are generally not accurate enough to be affected by problems with coordinate conversion (although differences between WGS-72 and local chart datums can be as much as 1/2 kilometer). The presence and growth of the Global Positioning System, a system with civil accuracies of 15 to 30 meters, will reveal the coordinate conversion problems heretofore disguised by use of less accurate systems. The marine electronics manufacturer, and ultimately the mariner, is thus faced for the next 5-10 years with an 'alphabet soup' of conflicting chart and coordinate converter datum/ellipsoid combinations. With no brilliant solution to offer, this paper relies on 'education of the consumer' as the only way out of this multivariable problem. (Edited author abstract) 2 refs.

Roeder, J.F. (Sperry Corp, Charlottesville, VA, USA). *Navigation* v 33 n 4 Winter 1986-1987 p 314-318.

**087959 FIELD TEST RESULTS PROVE GPS PERFORMANCE AND UTILITY.** Statistical and operational results of extensive government field-testing of the Rockwell-Collins Global Positioning System (GPS) units are summarized. The equipment has exhibited better than 16-m spherical-error probable-position accuracy in over 6300 hours of testing conducted during the past two years. One-channel, two-channel, and five-channel receivers were subjected to thorough evaluation. Their respective signal-processing and data-processing architectures are described. Data highlighting dynamic position accuracy, static position accuracy, acquisition times, and field reliability are presented. GPS equipment integration and operation with nine different host vehicles is described. The results of mission scenarios, such as area navigation, rendezvous, and weapon delivery, are presented. 9 refs.

**087960 SHORT-RANGE RADIO NAVIGATION SYSTEMS: CURRENT STATUS AND PROSPECTS.** The problems of the development of short-range navigation aids as integrated multifunctional systems for the near future while implementing them in poorly equipped regions, ice-breaker fleets, and on remote oil platforms are discussed. Conclusions are drawn about the reasonability of utilization for those purposes of various modifications of the existing integrated short-range navigation systems. These systems provide highly accurate operation, have a convenient  $p$ - $\theta$  coordinate system, and are capable in some cases of providing the additional functions. 4 refs.

**087961 FILTERING OF DISCONTINUOUS PROCESSES ARISING IN MARINE INTEGRATED NAVIGATION SYSTEMS.** A refined stochastic model for the errors of the Loran-C radio navigation aid is described, and it is shown how this model can be used to improve the performance of integrated navigation systems. In addition to the usual propagation errors, Loran-C time of arrival measurements are occasionally plagued with sudden intermittent errors of a particular magnitude and caused by receiver cycle selection errors. These result in sudden large jumps in the calculated position solution. Standard stochastic models, described by linear Ito differential equations driven by Wiener processes, cannot adequately describe the behavior of these cycle selection errors. Here, the Loran-C error has been modeled as the sum of a diffusion process, representing the normal propagation errors, and a pure jump process of Poisson type, representing the cycle selection errors. A simple integrated navigation system is then described, based on the Loran-C model and the standard dead reckoning (heading and speed) system model. Assuming that the observed process is governed by a linear stochastic difference equation, a recursive linear unbiased minimum variance filter is developed, from which the Loran-C and dead reckoning errors, and hence position and velocity, can be estimated. 11 refs.

**087963 ACHIEVING GPS INTEGRITY AND ELIMINATING AREAS OF DEGRADED PERFORMANCE.** There are two concerns regarding the civil use of the Global Positioning System (GPS). The first is 'integrity,' which is the possibility that GPS transmits an erroneous navigation signal to the user. A malfunction of the atomic frequency standard in the satellite is regarded as a possible integrity problem. The second concern is the areas of degraded performance. This paper discusses an approach to the solution of each of these two issues. It is shown that a communications type geostationary satellite is a common element to the solution of both concerns. Also common to both is a network of integrity monitoring and control stations. The paper discusses a system to cover the North American continent and also how it might be expanded to become worldwide. (Edited author abstract) 2 refs.

## Robot Applications

**087964 DESIGN OF AN INTEGRATED NAVIGATION SYSTEM FOR ROBOTIC VEHICLE APPLICATIONS.** This paper describes the design process for an integrated navigation system appropriate for robotic vehicle applications. The Global Positioning System (GPS) is considered as a primary positioning sensor, with an inertial system utilized for dead reckoning. Several possible dead reckoning system options were considered, including magnetic-compass/odometer, Doppler radar, and both two and three accelerometer inertial systems. Accuracy, autonomy, resistance to countermeasures, and cost were considered in evaluating the navigation system design alternatives. A simulation which realistically models the robotic vehicle environment was utilized in predicting navigation system performance. The simulation, along with representative results for the selected configuration(s), is also described. (Author abstract) 1 ref.

## United States

**087965 MID-CONTINENT LORAN-C EXPANSION.** The Coast Guard is extending the continental United States (CONUS) LORAN-C navigation system coverage as part of the Federal Aviation Administration project to incorporate LORAN-C into the National Airspace System. The increased coverage will expand the number of airports approved for LORAN-C nonprecision instrument approaches and enable direct Instrumental Flight Rules (IFR) routing by suitably equipped aircraft in and through the midcontinent region of the United States. The project will involve construction of a LORAN-C chain which will be linked to the existing CONUS chains. In addition to the aviation benefits, the midcontinent LORAN-C expansion will broaden the availability of LORAN-C positioning to a growing number of terrestrial users such as a resource management, emergency response and fleet management. 2 refs.

**087966 QUASIOPTIMUM ALGORITHMS FOR THE RECEPTION AND PROCESSING OF RADIO SIGNALS TAKEN INTO CONSIDERATION WITH ANOMALOUS TRACKING REGIMES.** Quasioptimum algorithms for the reception and processing of radio signals with anomalous tracking regimes taken into consideration are obtained using the methods of the Markovian theory of optimum nonlinear filtering and the poly-Gaussian approximation of the a posteriori probability density of the processes being estimated. The case of scalar observation, carrying information on a scalar process, is discussed in detail. The algorithms are generalized to the case of a vector observation and vector processes. The algorithms obtained are suitable for practical implementation and make it possible to use already known results for solving numerous important problems in the synthesis of circuits while taking anomalous tracking regimes into consideration. The high efficiency and operability of the proposed algorithms are demonstrated for a specific example, using the methods of mathematical simulation. (Author abstract) 18 refs.

**087967 SYNCHRODYNE A.M. RECEIVER: 3-CIRCUIT DETAILS OF THE DEMODULATOR AND R.F. STAGES.** The receiver section consists of a separate phase sensitive detector followed by a steep-cut low-pass filter, to give the required adjacent channel selectivity, and

some kind of muting circuit, in operation when the incoming signal is not in synchronism, to remove the off-tune whistle which is characteristic of the synchrodyne system. The adjustable steep-cut low-pass filter is built from a cascaded pair of 'bootstrap' filter circuits having a Q chosen to give a slope, for each section, of about 20dB/octave. The turn-over frequency is 9kHz, though this could be modified, as desired by the user, by proportional adjustments to the filter component values.

**087969 LOW COST SUPERREGENERATIVE SAW STABILIZED RECEIVER.** A superregenerative receiver that overcomes the problems of frequency drift and excessive bandwidth of the present state-of-the-art devices with little or no sacrifice in receiver simplicity and cost is described. The receiver makes use of a surface-acoustic-wave device to stabilize the center frequency and decrease the bandwidth of the regenerative circuit. The receiver provides a 20-dB improvement in sensitivity level, at least a factor-of-ten decrease in receiver bandwidth, quartz temperature stability, and a great reduction in the bandwidth of the emitted spectrum over that of conventional LC-controlled regenerative receivers. The performance more closely approximates that of a superheterodyne receiver but has the simplicity of a superregenerative receiver. This results in greater reception range together with greatly reduced risk of interference from other RF sources. 2 refs.

## Digital Devices

**087973 ZWEIDIMENSIONALE QUANTISIERUNG IN DIGITALEN KORRELATIONSEMPPFAENGERN FUER SPREAD-SPECTRUM-SIGNALE.** [Two-Dimensional Quantization in Digital Correlation Receivers for Spread-Spectrum Signals]. In digitally implemented correlation receivers for spread-spectrum signals, the complex-valued lowpass equivalent of the received signal has to be quantized. When analyzing and optimizing the quantizer a special difficulty arises from the fact that the quantization of a complex-valued signal represents a two-dimensional problem. In this paper, the theoretical fundamentals of two-dimensional complex quantization in digital correlation receivers as well as a technique for analyzing and optimizing two-dimensional quantizers will be presented. Two types of quantizers with two-dimensional quantization schemes structured according to rectangular and polar coordinates will be discussed as examples of great practical importance. Results of a numerical optimization of these two quantizers conclude the paper. (Author abstract). 21 Refs. In German.

## Mathematical Models

**087974 SENSITIVITY ANALYSIS OF QUASIOPTIMAL COMPLEX RECEIVERS AND THE PROCESSING OF PULSED AND CW SIGNALS.** Using the methods of optimal nonlinear Markov filter theory, equations are derived which make it possible to study the actual accuracy, noise-immunity, cutoff, and tracking characteristics of optimal complex receivers and processors of pulsed and CW signals. (Author abstract) 7 refs.

Artemenkov, V.S. *Sov J Commun Technol Electron* v 32 n 2 Feb 1987 p 9-16.

**087975 HIGH DYNAMIC GPS RECEIVER USING MAXIMUM LIKELIHOOD ESTIMATION AND FREQUENCY TRACKING.** A novel high dynamic Global Positioning System (GPS) receiver is presented and its performance characterized by analysis, simulation, and demonstration. The demonstration receiver is a broadband model capable of tracking a single simulated satellite signal in pseudorange and range rate. Pseudorange and range rate estimates are made once every 20 ms, using a maximum-likelihood estimator, and are tracked by means of a third-order fading memory filter in a feedback configuration. The receiver tracks pseudorange with rms errors of under 1 m when subjected to simulated 50 g, 40 g/s circular trajectories. The tracking threshold is approximately 28 dB-Hz, which provides a 12-dB margin relative to the minimum specified signal strength, assuming a 3.5-dB system noise figure and 0 dBi antenna gain. 10 refs.

## Microwave Frequencies See AMPLIFIERS, MICRO-WAVE.

Miniature See ELECTRONIC CIRCUITS—Tuning.

## Noise

**087976 TRANSFORMATION OF IMPULSE AND GAUSSIAN NOISE IN A RADIO-RECEIVER CIRCUIT.** Our aim is to determine the mathematical expectation, correlation function, and spectral density of the response of a radio-receiver circuit to the account of impulse and Gaussian noise. It is assumed that the radio receiver circuit consists of a series-connected linear system and square-law detector. 7 refs.

Protsenko, L.D.; Steklov, A.V. *Radioelectron Commun Syst* v 30 n 4 1987 p 103-106.

**087977 CONVERTING TSS TO DETECTION RECEIVER SENSITIVITY.** Receiver sensitivity is frequently characterized by signal levels that achieve the tangential-signal-sensitivity (TSS) condition. An alternate approach characterizes receiver sensitivity with signal levels that achieve a given detection-to-false-alarm probability. But this probability is difficult to predict when equally strong RF and postdetection noise signals exist simultaneously in the postdetection filter. However, the detection-to-false-alarm probability can be calculated from a measured or analytically determined TSS requirement, when the RF and postdetection noise signals present compete with a simple, unmodulated pulse-input signal. 5 refs.

Remmel, John A. (Ford Aerospace & Communications Corp, Newport Beach, CA, USA); Smith, Richard. *Microwaves RF* v 26 n 13 Dec 1987 7p between p 113 and 125.

## Noise, Spurious Signal

**087978 ON FM THRESHOLD EXTENSION BY CLICK NOISE ELIMINATION.** The validity of the click noise method of S.O. Rice (1963) for describing the performance of an analog threshold-extending receiver is established within the scope of a simulated environment. The significance of the received signal envelope for enhancing the detection of clicks is examined, and it is shown that a reliable click detector must make use of signal memory. A 'genie-aided' errorless click detector could lower the FM threshold by at least 6 dB. Threshold extension of 2.75 dB is observed under simulated conditions, with a realizable, clicks-cancelling receiver at a modulation index of five. 18 refs.

## Performance

**087980 QUALITY IN A.M. BROADCAST RADIO.** A method for providing variable selectivity while maintaining a level I.F. frequency response is discussed. The aim is to provide a better quality of AM reception. The role of IF bandwidth, RF bandwidth, and IF stability is examined. 2 refs.

Kearsley-Brown, R. *Electron Wireless World* v 94 n 1624 Feb 1988 p 188-189.

**087981 EIN SYNCHRONER HOMODYNE-EMPFANGER FUER FM MIT VERBESSERTER EMPFINDLICHKEIT UND SELEKTIVITÄT.** [Synchronous Homodyne-Receiver for FM with Improved Sensitivity and Selectivity]. Compared with the heterodyne-receiver the synchronous homodyne-receiver in principle has a series of advantages. These advantages

however, are not available in the concrete receiving situation because of a too small useful sensitivity and selectivity of the usual underlying phase-locked loop. In the present paper a tanlock loop with increased selectivity is pointed out. Moreover, it is given a concept for effective drift control in the working condition of the phase-locked loop and in consequence for an essential improvement of the useful sensitivity. (Author abstract). 10 Refs. In German.

Kreutzer, Martin (Univ des Saarlandes, West Ger). *Frequenz* v 42 n 5 May 1988 p 147-152.

## Remote Control

**087982 EDDYSTONE 1995 SERIES OF V.H.F./U.H.F. COMMUNICATIONS RECEIVERS - A USER'S GUIDE.** The Eddystone 1995, a new high-performance general coverage v.h.f./u.h.f. communications receiver, with comprehensive signal reception and operating facilities, is described. The operating system, based on that developed for the Eddystone 1650 l.f./h.f. receiver, has been enhanced and extended for both the v.h.f./u.h.f. receiver and a new version of the l.f./h.f. receiver. Together, these matching equipments can monitor the complete 10kHz to 1.1GHz spectrum. Many of the operating improvements have been in tuning, scanning and sweeping, and particular attention is paid to these in these article. Built-in test equipment (BITE) is becoming standard to aid fault finding in sophisticated equipment. A method to provide reliable BITE and the way it can be used are described. For remote control, compatibility with a wide range of standard data communications equipments is essential. Use of such equipment with the new receivers is detailed, as is the use of a mixture of long and short commands to maximize speed of control for the widest variety of tasks. (Author abstract) 1 refs.

Sutton, R.T. *Commun Broadcast* n 29 Mar 1988 p 3-9.

## Single Sideband

**087983 MODE DETECTOR OF SSB RADIO.** Two different activity modes of an SSB radio system are defined: carried wave with or without modulation. A detector based on nonlinear functional filtration is proposed. The detector decides which of the two above defined modes of SSB radio activity is presented. The results are expressed in a 'radar language', i.e., the probability of detection as a function of input snr for a fixed probability of false alarm is given. (Edited author abstract) 7 refs.

**087984 SIGNAL PROCESSING TECHNIQUES IN DIGITALLY IMPLEMENTED RADIOS.** With the rapid advancements in digital VLSI circuit design and implementation there is a great incentive to explore the possibility of digitally implementing radio functions that had hitherto been performed exclusively by analog circuits. This offers the advantages inherent to all digital circuits of increased reliability, ease of manufacture and ease of testing. Furthermore, by using general purpose digital signal processors, this approach permits software reconfigurable hardware to be used thus allowing many different radio functions to be integrated into the same equipment. Increasingly high performance professional radios are being required to incorporate data modems, digitized voice, encryption, multipath compensation, channel equalization and other advanced functions. 1 ref.

**087990 AUTOMATIC DECISION THRESHOLD LEVEL CONTROL (ADTLC) IN DIRECT-SEQUENCE SPREAD-SPECTRUM SYSTEMS BASED ON MATCHED FILTERING.** An automatic decision-threshold-level control (ADTLC) algorithm for direct-sequence spread-spectrum systems is described and analyzed. Two parameters of interest, probability of false alarm  $P_a$  and probability of correct signal detection  $P_d$ , are controlled simultaneously. As an example, the implementation of the algorithm in several practical direct-sequence spread-spectrum receivers is discussed. A considerable advantage of this algorithm compared to the classical approach (constant false alarm probability control) to the problem has been demonstrated. 8 refs.

## Calculations

**087992 METHOD FOR CALCULATION OF STEADY-STATE PROCESSES IN NONLINEAR WEAKLY DAMPED SYSTEMS.** Nonlinear devices operating in periodic steady-state mode represent a large class of radioelectronic devices whose analysis presents serious problems. This applies primarily to weakly damped systems: frequency multipliers and dividers, mixers, self-excited oscillators, parametric amplifiers, etc. In these systems a transient may last for several tens of periods and its calculation leads to enormous expenditures of machine time. The published methods for fast determination of a steady-state process are inefficient or inapplicable in analysis of weakly damped systems. What is more, it is impossible in practice to utilize them to analyze systems described by partial differential equations. The algorithm to be proposed here yields a noticeable improvement in the solution of this problem. For time-domain analysis in a large signal regime nonlinear devices are usually described by a system of nonlinear differential equations. We represent the solution of such a system as a generalized vector function  $y^-(t)$ , which is the set of currents and voltages at the corresponding branches and nodes of the investigated circuit. 6 refs.

## Computer Simulation

**087994 DISTRIBUTED SIMULATION AND PROTOTYPING TESTBED FOR RADIO COMMUNICATION NETWORKS.** The authors discuss the development of a tested, called the distributed simulation and prototyping testbed (DSPT), to model variable-connectivity radio networks. The DSPT constitutes a software environment in which distributed simulation and prototyping models of radio communication and command and control systems can easily be built. The environment consists of four separate software packages: communication simulation, communication monitor, scenario update/controller, and prototype node. These four packages work together to form a single distributed simulation and prototyping facility for communication network studies. They relieve the user from the need to consider many of the details that must be handled to implement a distributed testbed. Each package is easily extensible and can be tailored to specific networks, scenarios, monitor views, and prototyping needs. 18 refs.

## Design

**087996 CHOOSING PREDICTIVE PARAMETERS FOR RADIOELECTRONIC APPARATUS.** In designing systems for maintenance of radioelectronic apparatus (REA) proper selection of the parameters used for monitoring and forecasting of REA state is very important. These are the predictive parameters (PP). The problem of selection of PP has not been dealt with adequately in the literature, and no allowance has been made for economic factors. This paper discusses the specification of a quantitative measure of the suitability of PP on the basis of a cost-reliability criterion for the effectiveness of technical maintenance (TM) with prediction of the state of the REA. 3 refs.

## Microwaves

**088001 COCHANNEL INTERFERENCE BETWEEN POINT-TO-POINT URBAN MICROWAVE RADIO SYSTEMS.** Low-cost point-to-point radio systems are available at a number of frequencies in both the centimetre and millimetre wavebands for local business applications. In urban areas a high degree of cochannel operation is predicted, both for reasons of spectral efficiency, and because forecast demands exceed the number of available channels. The paper presents a probabilistic study of the limiting cochannel interference effects, based on an idealized flat circular locality model. The study indicates that high system populations, or area capacities, should be achievable. For example in a typical large metropolitan area, the predicted capacities for one way systems sharing a single channel, are several hundred for centimetre wave (13 GHz) systems, and several thousand for millimetre wave (39 GHz) systems. It is demonstrated that the area capacity is proportional to the square of the antenna diameter to wavelength ratio. There is thus a high incentive to employ equipment with relatively large antennas, and to operate wherever possible in the millimetre wavebands. (Edited author abstract) 11 refs.

## Performance

**088003 REDISTRIBUTION OF RESOURCES IN RADIO SYSTEMS OPERATING UNDER NONSTATIONARY CONDITIONS.** We consider a system of radioelectronic facilities operating with broadband signals. The system functions under nonstationary conditions determined by the mobility of the facilities, and by the variation in the characteristics of existing noise. The working elements of the system are radio channels (RC). A limited frequency-time resource (FTR)  $v = F \times T$ , is allocated for operation of the system, where F and T are the frequency band and time interval set aside. 3 refs.

## Radiation Effects See ANTENNAS—Radiation.

## Stations See Also TRAFFIC SIGNS, SIGNALS AND MARKINGS.

**088004 ERIGEN POWER SUPPLY SYSTEM IN THE TRACK RADIO NETWORK OF THE SWEDISH STATE RAILWAYS.** One of the major problems encountered by the Swedish State Railways (SJ) when extending its track radio network in sparsely populated areas is how to power the base radio stations. Ericsson's primary power system ERIGEN is an alternative which gives freedom in the choice of site for a base radio station. An ERIGEN system has been in operation for some years at one of the SJ base radio stations along the inland main line. The solar and wind system is designed to power remote telecommunications plants situated far from the electricity mains. The authors describe the design of the system, its parts and also the operational results obtained during the 2 1/2 years of service (Edited author abstract) 3 refs.

## Testing

**088006 ESTIMATE RESIDUAL BIT-ERROR RATIOS IN DIGITAL RADIOS.** Residual bit-error-ratio (RBER) testing is critical when evaluating digital radios. This figure of merit, recently endorsed by the CCIR in recommendation 594, helps to evaluate the overall performance of a digital communication system. RBER estimations need not follow the time-consuming rituals of traditional measurement routines. This article discusses two techniques which can help to reduce measurement times for testing residual bit-error ratios in digital radios.

**088007 NOISE STABILITY OF ALGORITHMS WITH SOLUTION FEEDBACK FOR DIVERSITY RECEPTION OF PHASE-KEYED SIGNALS.** Algorithms optimal in Gauss approximation, a block diagram for a quasicohherent receiver (QCR), and a formula for analyzing its noise stability have been obtained in the class of Markov processes for the case of diversity reception (DR) of phase-keyed (PK) signals and a statistically homogeneous channel with Rayleigh-type fading. We develop a method suitable for analysis of the noise stability of various varieties of suboptimal QCR with SFB that takes into account the specific features of operation of such devices in a stochastic radio channel. 6 refs.

**088008 NOVEL ANTI-MULTIPATH MODULATION TECHNIQUE DSK.** A modulation technique called DSK (double phase-shift keying), which shows an interesting antipath feature over mobile frequency-selective fading environments, is introduced. The performance of this technique is shown for various multipath channels by waveform detection and theoretical bit error rate (BER) analysis, and numerical results of a laboratory experiment, which support the theoretical results, are presented. A generalized form of DSK is described, and investigations are made to clarify the antipath effect of DSK and to further explore the possibility of a narrowband scheme. A major result shows that this technique can give a form of diversity effect that is implicit in the arrival of signals via multiple paths with different delays. 28 refs.

**088009 CLIPPED DIVERSITY COMBINING FOR CHANNELS WITH PARTIAL - BAND INTERFERENCE - I: CLIPPED - LINEAR COMBINING.** Clipped-linear diversity combining is analyzed for receivers without side information. Communication systems with noncoherent demodulation, binary and M-ary orthogonal signaling, and diversity transmission are considered. The main source of interference is additive Gaussian partial-band interference, but a nonzero quiescent noise level is included in the analysis to account for wideband noise sources. Some of the results apply to general (non-Gaussian) interference. The numerical results demonstrate that clipped-linear combining can perform well in terms of both narrowband interference rejection capability and maximum signal-to-interference ratio requirement. A practical disadvantage of clipped-linear combining is that it relies on measurements of the signal output voltage. 13 refs.

Keller, Catherine M. (Northeastern Univ, Boston, MA, USA); Pursley, Michael B. *IEEE Trans Commun* v COM-35 n 12 p 1320-1328.

**088010 DIVERSITY AND CODING FOR FH/MFSK SYSTEMS WITH FADING AND JAMMING - I: MULTICHANNEL DIVERSITY.** The performance of diversity and/or coding is evaluated for FH/MFSK (frequency-hopped/multiple frequency-shift keyed) signaling over Rayleigh fading channels in the presence of jamming. The effects of partial-band tone and partial-band noise jamming on uncoded and coded systems are considered. The results indicate that FH/MFSK signaling with diversity provides satisfactory performance for jammed fading channels. For coded FH/MFSK signaling over fading channels, noise jamming may be more effective than tone jamming. The amount of im-

provement resulting from the use of diversity in conjunction with coding depends on many factors, including the nature of the channel, the degree of channel state information available at the decoder, the type of decoding, and the modulation alphabet size. 12 refs.

Stuber, Gordon L. (Georgia Inst of Technology, Atlanta, GA, USA); Mark, Jon W.; Blake, Ian F. *IEEE Trans Commun* v COM-35 n 12 p 1329-1341.

**088011 ERROR-CORRECTING CODES AND NONLINEAR DIVERSITY COMBINING AGAINST WORST CASE PARTIAL-BAND NOISE JAMMING OF FREQUENCY-HOPPING MFSK SYSTEMS.** Error probability analyses are performed for a coded M-ary frequency-shift keying system (MFSK) using L hops per M-ary word frequency-hopping spread-spectrum waveforms transmitted over a partial-band Gaussian noise jamming channel. The bit error probabilities are obtained for a square-law adaptive gain control receiver with forward-error-control coding under conditions of worst-case partial-band noise jamming. Both thermal noise and jamming noise are included in the analyses. Performance curves are obtained for both block codes and convolutional codes with both binary and M-ary channel modulations. The results show that thermal noise cannot be neglected in the analysis if correct determinations of the optimum order of diversity and the worst-case jamming fraction are to be obtained. It is shown that the combination of nonlinear combining, M-ary modulation, and forward-error-control coding is effective against worst-case partial-band noise jamming. 19 refs.

## Analysis

**088012 SPACE DIVERSITY DETECTORS OF FLUCTUATING SIGNALS IN THE PRESENCE OF SPATIALLY CORRELATED INTERFERENCE.** Two classes of space diversity systems in which coherent compensation of spatially correlated interference is possible are examined. These are spatially coherent systems and systems with short-time spatial coherence. The concept of spatial coherence of signals and interference in a multi-positional system is refined. Optimality conditions are specified for some known algorithms for detecting fluctuating signals with varying degrees of spatial coherence in the presence of spatially correlated interference, and a number of new algorithms (including adaptive ones) are synthesized. (Edited author abstract). 15 Refs.

Chernyak, V.S. *Sov J Commun Technol Electron* v 32 n 9 Sep 1987 p 10-20.

**088013 MULTIPATH DIVERSITY RECEPTION OF SPREAD-SPECTRUM MULTIPLE-ACCESS COMMUNICATIONS.** The analysis of a multipath-combining receiver for direct-sequence spread-spectrum communications through a specular multipath channel is developed. The analysis applies to systems that use quadriphase-shift-keyed, offset quadriphase-shift-keyed, minimum-shift-keyed, or binary phase-shift-keyed modulation. The measures of performance are the signal-to-noise ratio and approximations to the error probability involving the signal-to-noise ratio. The performance of a multipath-combining receiver is determined for a single transmitter and for multiple interfering transmitters. The performance of the system is determined in terms of parameters of the signature sequences, which can be used as guides in selecting signature sequences for the system. Results are also given for the case of randomly generated signature sequences. 17 refs.

## Efficiency

**088014 LEISTUNGSFAEHIGKEIT VON MEHRANTENNEN-DIVERSITY FUER DEN UKW-**

**RUNDFUNK IM AUTO.** [Efficiency of Multiantenna VHF/FM Diversity Reception in Automobiles]. In VHF/FM reception, multipath propagation causes severe interference and disturbances in the received signal level. Large differences in propagation delays, co- and adjacent-channel interference, intermodulation effects and noise are encountered. All these distortions cause frequency shifts relating to the simultaneous variations of the rf and if signal amplitudes. The extent of these shifts and variations can be used as criteria governing the operation of a quasi-instantaneous interference detector. Using a fast antenna switch controlled by the detector, any form of VHF/FM receiver can be fitted with an antenna diversity system. The logarithm of the signal-quality improvement factor is found to be approximately proportional to the number of additional antennas. No additional tuning circuits are needed in the receiver. (Edited author abstract) 7 refs. In German.

Lindenmeier, Heinz; Manner, Ernst. *Rundfunktech Mitt* v 31 n 5 Sep-Oct 1987 p 221-228.

## Evaluation

**088015 EVALUATION OF SPECIFIC DIVERSITY COMBINERS USING SIGNALS RECEIVED BY VERTICALLY-SPACED BASE-STATION ANTENNAS.** A series of field trials has been conducted in which a 900 MHz cw signal was transmitted from a vehicle moving along a test route some 1.3 km from a base station. The recorded envelopes of the signals received on two vertically-separated antennas at the base station have been used in a computer simulation of two-branch predetection diversity reception. Several different systems have been simulated and the computed results show that the theoretical diversity advantages can still be obtained for an envelope cross-correlation ( $\rho_{env}$ ) of less than 0.7 for all strategies except switching. For a 1.3 km radius cell, a  $\rho_{env}$  less than 0.7 can be obtained using antennas with a vertical separation of about 12λ. It has been found that the cumulative distribution and level-crossing rates of the signal are substantially improved and the average fade duration is approximately halved. (Author abstract) 9 refs.

## Mathematical Models

**088016 MACROSCOPIC DIVERSITY PERFORMANCE MEASURED IN THE 800-MHZ PORTABLE RADIO COMMUNICATIONS ENVIRONMENT.** Analysis of 816-MHz residential propagation data is presented, demonstrating the usefulness of macroscopic selection diversity in combatting shadow fading produced by buildings and other large geographic features in the portable-radio communication environment. Macroscopic diversity can reduce the link margin needed for 99% reliability by 10 dB. The analysis of these data indicates that log-normal shadow fading is partially correlated on the paths between a portable user and several surrounding ports. A two-component shadow-fading model duplicates this behavior. One log-normal term is identical for all paths from a given location and characterizes the propagation losses associated with the location. A second log-normal component is independent for each path and characterizes the remainder of the path to the port. The model fits the propagation data as well. A standard deviation of 8 dB for the path-specific term fits subsets of the available data well and is consistent with the standard deviation of shadow fading in the mobile (vehicular) communication environment. 12 refs.

## Protection

**088019 DIVERSITY PROTECTIONS FOR DIGITAL RADIO - SUMMARY OF TEN - YEAR EXPERIMENTS AND STUDIES.** A summary is presented of a series of critical experiments that led to recent discoveries of large improvement factors for digital radio performance by antenna pattern diversity, antenna angle diversity, frequency diversity, and space diversity. The measured diversity improvement factors for digital radio against multipath dispersive fading are larger than those predicted by the existing analog radio model by at least one order of magnitude. Applications of these findings will lead to substantial savings in the cost for diversity protections for digital radio routes. These discoveries stimulated the development of new models of diversity improvement factors for digital radio and the development of the DRDIV computer program for engineering digital radio routes. Background information is given on multipath fading and diversity concepts, and a glossary of terms is included. 43 refs.

**088020 DESIGN OF DIGITAL SIGNAL PROCESSING QUADRATURE MODULATOR FOR DIGITAL FM AND ANALOG FM SIGNALS.** In the field of mobile communication, the transmission of picture and data signals in addition to conventional speech transmission requires modulators that are suitable to both analog and digital FM. In the present paper such a quadrature modulator is proposed which provides stable transmission characteristics by digital signal processing (DSP) techniques. The analysis is mainly aimed at additional noise effects due to the digital generation of analog FM signals. Based on the results of this analysis, a modulator design method providing sufficiently high noise suppression is presented in a flowchart form. (Edited author abstract) 14 refs.

**088021 HALF-BIT OFFSET DECISION FREQUENCY DETECTION OF DIFFERENTIALLY EN-**

**CODED GMSK SIGNALS.** An efficient frequency detection scheme for GMSK signal reception is described. In this scheme, a three-level eye opening of the frequency detector output at the decision instant offset by a half-bit is used to improve bit error rate (BER) performance. Experimental results for 16 kbit/s differentially encoded GMSK transmission with a premodulation filter bandwidth-bit duration product ( $B_bT$ )=0.25 (typical for mobile radio applications) show that the half-bit offset decision frequency detection scheme can improve BER performance, in comparison with conventional detection schemes. (Edited author abstract) 7 refs.

**088022 CHARACTERISTICS OF ANTENNA PATTERN DIVERSITY BRANCHES IN URBAN MOBILE RADIO.** The performance of mobile communication is greatly degraded by the multipath fading which is a large problem in future digital mobile communication. We made a detailed analysis of the urban propagation characteristics and found that use of a directive antenna in a mobile station reduces the fading by the effect of antenna pattern itself. We suggested that excellent diversity branches can be realized by combining more than one directive antenna. This paper discusses first the basic condition for the antenna pattern diversity branches. Correlation characteristics are examined by measurement of 2- and 4-branches. The reduction of the fading is estimated by computer simulation based on the measured data. (Edited author abstract) 23 refs.

**088027 EXPERIMENTAL MOBILE SATCOMMS.** PRODAT is an experimental satellite communications relays system for data transmission between mobile users on land, at sea and in the air, and even by fixed users at home or office. It represents a critical part of PROSAT, an ESA-funded experimental satellite project for low cost aviation and maritime communications relay initiated in December 1981. Transmissions between the ground station and satellite are in the 4 to 6GHz range; 1.5 and 1.6GHz are employed between mobile terminals and the satellite for the forward and return links respectively. The PRODAT programme will provide aircrew data communications and passenger telex facilities via ground data networks throughout a flight without resorting to often unreliable HF radio links. PRODAT is part of Phase II of the ESA PROSAT project addressing advanced mobile communications techniques.

**088028 EXCESS DELAY POWER PROFILES MEASURED IN MOUNTAINOUS TERRAIN.** The paper reports on the results gained in Switzerland in a joint campaign of the PTTs of the Federal Republic of Germany and Switzerland. The results, based on more than 70,000 impulse responses measured in different mountainous areas, support the Recommendation of COST 207 to the GSM (Groupe Special Mobile) about the length of excess power delay profiles to be considered in the new digital mobile radio system. (Author abstract). 19 Refs.

**088029 PERFORMANCE OF PARTIAL RESPONSE CPM SYSTEMS WITH NARROWBAND CHANNEL AND LIMITER-DISCRIMINATOR DETECTION.** In the context of research developed to define the design criteria of a European digital public land mobile radio network, attention has been paid, in recent years, to partial response continuous phase modulation systems. In the authors' opinion, a crucial point of system design is determination of the actual spectral efficiency obtainable by means of these techniques through consideration of adjacent and cochannel interferences which are present in the cellular mobile radio network. At any rate, with a view to investigating this research area, a first step in the authors' opinion is to evaluate the behavior of CPM signals over narrowband channels and so the combined effects of intersymbol interference (due both to generation of the signal and to the channel) and noise have been evaluated in this paper for any choice of modulation pulse shaping. The implemented computer program allows general analysis of CPM systems with limiter-discriminator detection and symbol-by-symbol regeneration. (Edited author abstract). 13 Refs.

**088030 NEW SPEECH SIGNAL SCRAMBLING METHOD FOR MOBILE RADIO APPLICATIONS.** Secure communications systems have acquired a particu-

lar importance today, especially as concerns mobile radiocommunications. At present, however, highly secure signal scrambling systems are limited in that they require frame synchronization; this not only limits the system's reliability but complicates its use. This paper presents a two-dimensional signal scrambling method based on digital signal processing techniques which eliminate the need for frame synchronization, but maintain an extremely high level of communications security. Such techniques include short-time Fourier analysis and the filter bank concept. The paper also discusses the use of special digital FIR filters which make it possible to completely implement the system algorithm via commercial processor software. As a result, the system can be configured with very little hardware. Finally, the paper presents an investigation of valid keys and available key space. (Author abstract). 6 Refs.

**088031 PROBLEMS OF ASSIGNED FREQUENCIES FOR PRIVATE MOBILE RADIO AND TWO SOLUTIONS.** Existing arrangements for private mobile radio (PMR) assignments are spectrum-inefficient. Trunked PMR systems are better but may not be able to cope with areas of densest demand. A proposal for scanning PMR is made and possible difficulties examined. (Author abstract). 3 Refs.

**088032 DIGITALER MEHRTRAEGER-DEMULPLEXER FUER DEN MOBILEN SATELLITENFUNK.** [Digital Multicarrier Demultiplexer for On-Board Application in Mobile Satellite Communication.]. This paper is focused on the description and the design of the hierarchical multistage method (HMM) for digital demultiplexing of an FDM signal being composed of L adjacent SPC signals. L is (preferably) a power-of-two, here L=32. This HMM approach to FDM demultiplexing applies bandpass sampling and is based on the processing of complex-valued signals by linear-phase FIR filters, where at any stage of the processing the respective signals are always oversampled by two. An electrical demonstration model has been constructed by cascading six identical specially designed signal processors. (Author abstract). 16 Refs. In German.

**088033 DIGITALER DEMODULATOR FUER MOBILE SATELLITENFUNK.** [Digital Demodulator for Mobile Satellite Communication.]. Future mobile satellite communications systems for data and speech transmission require extensive signal processing on board satellites. This is necessary since both circuit switching and data regeneration are to be implemented in satellites. FDM demultiplexers for channel separation are required in satellites in order to realize switching functions. Data are then regenerated using channel-specific demodulators. The following paper describes the design, performance and realization of such a channel-specific demodulator. The requirements involving the demodulator, particularly synchronization, are very high due to the mobile communication channel with fading and Doppler offset. New frequency and timing loops as well as a status-controlled synchronization routine ensure high-speed synchronization of the demodulator, even if the quality of the channels is poor. An electrical demonstration model of the demodulator, developed in conjunction with an ESA contract, is realized with a 16 bit CMOS signal processor. (Author abstract). 12 Refs. In German.

**088034 CAUSES OF BURST ERRORS IN MULTIPATH FADING CHANNEL.** The so-called irreducible

error due to frequency-selective fading is known to have a serious effect on mobile radio communication systems. Thus, the analysis of such errors is a prerequisite for making high-speed digital signal transmission over a fading channel feasible. The authors attempted to elucidate the physical mechanisms causing such errors using laboratory measurements of microscopical bit error rate. The results clarified some sources of burst errors in a multipath fading channel. In particular, large and rapid timing fluctuations of eye pattern due to severe delay distortion of the multipath channel was found to be the most dominant source of error. 20 refs.

**088035 WIDE-BAND PACKET RADIO FOR MULTIPATH ENVIRONMENTS.** A direct-sequence spread-spectrum packet radio is described that has versatile signal-processing and local-control capabilities designed to support the functions required of a robust mobile communications network. Noteworthy capabilities include eleven selectable data rates with accurate range measurements in a fading multipath channel. The radio uses a hybrid analog/digital signal processor and nonrepeating spreading codes for suppression of intersymbol interference and jamming. It incorporates two sets of monolithic surface-acoustic-wave convolvers as programmable matched filters with time-bandwidth products of 64 and 2000. The analog matched filters are coupled with binary postprocessing for the functions of detection, RAKE demodulation, and ranging measurements over a wide multipath spread. The data rate can be varied in response to channel conditions from 1.45 Mb/s down to 44 b/s with an almost ideal tradeoff in signal-processing gain from 18 dB up to 61 dB prior to multipath combining. 37 refs.

**088036 THEORETICAL EVALUATION OF SOFT DECISION GAIN FOR BLOCK FEC IN A LAND MOBILE RADIO CHANNEL.** The soft decision gain for the block FEC code transmitted with an arbitrary degree of bit-interleaving through a land mobile radio channel is theoretically evaluated. As a soft decision decoding scheme the Chase decoding is assumed and as a land mobile radio channel the multiplicative time-variant Rayleigh fading channel is assumed. The bit error rates (BER) are formulated both for the hard decision decoding and for the soft decision decoding in two modem cases of noncoherent BFSK and coherent BPSK, respectively. (Edited author abstract) 15 refs.

## Analysis

**088037 OUTAGE PROBABILITY CALCULATIONS FOR A MOBILE RADIO SYSTEM HAVING TWO LOG-NORMAL INTERFERERS.** Outage probability calculations are presented for the case when the transmission from a wanted base station is received by a mobile in the presence of two cochannel-interfering signals for the case where the transmissions suffer log-normal shadowing only. The calculations consider the need to achieve simultaneously both a sufficient snr and SIR to obtain satisfactory radio reception. (Author abstract) 6 refs.

Sowerby, K.W. (Univ of Auckland, Auckland, NZ); Williamson, A.G. *Electron Lett* v 23 n 25 Dec 3 1987 p 1345-1346.

**088038 GMSK FREQUENCY DETECTION USING DECISION FEEDBACK EQUALISATION.** Frequency detection of GMSK signals using one-bit decision feedback equalization (DFE) in conjunction with offset decision instant is presented. Experiments on a 16 kbit/GMSK signal reception with a premodulation filter bandwidth-bit duration product ( $B_bT$ ) of 0.25 (typical for mobile radio applications) show that, compared to MSK signal reception, a bit error rate (BER) of  $10^{-2}$  is obtained with a loss of about 4db in the signal energy per bit/noise power density ratio ( $E_b/N_0$ ) in the additive white Gaussian noise (AWGN) channels. In the cochannel interference limited channels, a BER of  $10^{-2}$  is obtainable at a signal/interference power ratio (SIR) about 5.5 db larger than in the case of MSK signal reception. **088039 STATISTICAL PARAMETERS OF BROADBAND SIGNALS IN MULTIBEAM CHANNELS OF TRANSPORTATION RADIO SYSTEMS.** A discussion is currently under way as to the desirability of utilization in transportation radio communications systems of broadband signals (BBS) which, first, having increased information redundancy, ensure good communication stability in a complex noise environment; second, permitting code multiplexing of channels, they make possible effective solution of the problem of electromagnetic compatibility of radio facilities in ramified radio networks. The specific types of interference characteristic of transportation radio systems include multiplicative noise produced by multibeam propagation of radio waves and relative motion of transceivers. To evaluate noise immunity and synthesize optimal BBS receiver circuits it is necessary to construct a mathematical model of the broadband signal at the output of a multibeam channel, which is our subject in this paper. 4 refs.

**088040 NARROWBAND DIGITAL MODEMS FOR LAND MOBILE RADIO.** The modems operate in the 900 MHz band and with a channel spacing of 25 kHz. Each transmitted signal from a mobile is a four-level QAM signal with an element rate of 12,000 bauds and a total bandwidth of 24 kHz. 20% redundancy is allowed for retraining and synchronization purposes, giving a useful transmission rate of 19,200 bit/s for each QAM signal. Coherent demodulation together with a new technique of combined signal-detection and channel-estimation are used at the receiver, for more accurate tracking of the rapidly fading signal. Two four-level QAM signals can be transmitted simultaneously over each separate frequency band, giving a resultant bandwidth efficiency of just over 1.5 bit/s per Hz for useful data. The independent fading of the two signals, together with the particular detection and estimation processes employed at the receiver, prevent any undue interference between the two signals. The signals fed from the base station to the mobiles are 16-level QAM signals, that are frequency division multiplexed, with a channel spacing of 25 kHz. Each signal has an element rate of 12,000 bauds and a total bandwidth of 24 kHz. Two mobiles are fed from any one 16-level QAM signal, and the bandwidth efficiency for useful data is again just over 1.5 bit/s per Hz. (Edited author abstract) 25 refs.

**088042 CELLULAR TECHNOLOGY: IMPACT ON DEVELOPING AREAS.** This paper addresses the major characteristics of 800-900 MHz cellular technology to evaluate its application to meet the needs of developing areas. The analysis considers the application of the total access communications system (TACS) which is in widespread use in the United Kingdom and other parts of the world. The high capacity and economies of scale of TAS as well as the availability of ample radio frequency allocations are significant considerations. The paper presents typical cellular radio coverage areas for fixed, mobile, and portable subscriber units and provides an economic analysis of costs per subscriber for mixture of fixed and mobile subscribers. In conclusion the 800-900 MHz cellular radio service appears economically attractive in comparison to the costs of a wire-based network in developing areas. (Author abstract) 3 refs.

**088044 CELLULAR NETWORK PLANNING IS MAXIMIZING SYSTEM ECONOMY.** Networks for mobile telephone are complex and need thorough planning and engineering. This is valid for the initial implementation, but to an even higher degree for the subsequent growth of the networks. Adaptation of nominal cell planning schemes to real world topography and traffic patterns requires powerful network planning tools. The economic impact of proper planning is strong, since the income from the network is directly related to the effective use of each radio channel. The authors describe some of the methods and tools for cellular network planning that are used to support projects and customers in this task. They emphasize the importance of initial planning for the mature system and of linking together radio measurements and theoretical radio propagation models. (Edited author abstract)

**088045 CELLULAR RADIO TELEPHONY - THE RACAL-VODAFONE NETWORK IN GREAT BRITAIN.** With its cellular radio network in the United Kingdom, Racal-VODAFONE is the most successful mobile telephone operator in the world. From launch of the service in January 1985, over 100,000 subscribers were achieved by mid 1987, and coverage provided to over 90% of the population of the UK. The network uses Ericsson CMS88 technology and is centered around AXE 10 digital mobile telephone exchanges. As a result of additional subscribers joining at a world leader rate of over 5,000 per month, the network is being continually expanded towards a forecast capacity of over 300,000 subscribers by 1990. Additional frequencies are also being made available and the VODAFONE network will be enhanced to the new UK E-TACS standard early in 1988. (Author abstract)

**088046 ERICSSON TELEPHONES FOR CELLU-**

**LAR SYSTEMS.** Ericsson Radio Systems is continually engaged in developing new mobile telephone terminals to suit the growing customer demand and utilize the rapidly changing technical possibilities. The progress in component miniaturization and surface mounting production methods has now made the pocket telephone concept viable. It has also led to a new Ericsson generation of combined mobile and transportable products with approximately half the weight and size of those of the previous generation. The authors describe a new generation of products introduced in 1987 for the NMT systems. (Author abstract)

Jismalm, Greger; Rydbeck, Nils. *Ericsson Rev (Engl Ed)* v 64 n 3 1987 p 141-150.

**088047 MALAYSIA CELLULAR SYSTEM - PIONEER IN ASIA.** The mobile cellular telephone system in Malaysia, ATUR, has been in operation since January 1985. Subscriber growth has been steady throughout the country, and at a higher rate than anticipated. The system is also widely used to connect subscribers in rural areas, not yet provided with wire lines to the public telephone network. The authors describe early mobile telephone systems in Malaysia, implementation of the ATUR system, various market aspects and how the system capacity in the Kuala Lumpur area was increased through the introduction of small-cells. (Author abstract)

**088048 DIGITAL CELLULAR RADIO FOR THE FUTURE.** The experiences gained from cellular systems operating today, indicate that market expansion is often limited by system capacity. Frequency spectrum is a natural resource which is limited, but through development of new equipment it has been possible to utilize the frequency spectrum more efficiently. The resulting new system standards and network concepts introduced through the years have improved system capacity, but today's systems can still serve only a small fraction of the total population. The next generation of systems, to be used in the nineties, must be able to serve a broader market covering a substantial proportion of the consumer segment. (Author abstract) 7 refs.
